Pennsylvania, by long odds the most important producer, wth an output of 137,300,000 tons, showed a total of expenses of $117,440,000 and of value of $129,550,000, a balance on the profit side of a little over $12,000,000, or about 3½ per cent. on the capital invested, $358,600,000. The four competitive states, West Virginia, Illinois, Ohio and Indiana, which rank second, third, fourth and fifth, respectively, in producing importance, all show such narrow margins between income and outlay that profits are visible only with a microscope. The figures follow:

	Value of Product	Expenses	Difference
West Virginia	$44,344,067	$43,024,716	$1,319,351
Illinois	53,030,545	51,697,504	1,333,041
Ohio	27,353,663	27,153,497	200,166
Indiana	15,018,123	14,906,831	111,292
	$139,746,398	$136,782,548	$2,963,850

These four states with an aggregate production of a little more than the bituminous output of Pennsylvania, showed a total of less than $3,000,000 as the excess of receipts over expenses. The capital invested in the coal-mining industry in these states was something over $310,000,000, so that the returns on the capital were less than 1 per cent.

More Profitable Conditions in the West

There is one other fact to which I desire to call attention, and that is to the conditions in the public-land states, which are also coal producers. They are California, Colorado, Idaho, Montana, New Mexico, North Dakota, Utah, Washington and Wyoming. All of them showed favorable comparisons with other states. They produced in round numbers 25,000,000 short tons of coal in 1909. The value of the product was $37,000,000; the expenses, $32,400,000, the difference being, say, $4,600,000. The capital reported was approximately $70,000,000, so that the average earnings on the capital invested in these states was between 6 and 7 per cent., as compared with less than 1 per cent. in West Virginia, Illinois, Ohio and Indiana, and of about 2.5 per cent. for all the bituminous coal mined in the United States in 1909.

I have not prepared this paper as an advocate of the coal-mine operators of the United States. I must, in fact, confess that when I began, less than three weeks ago, a study of the Census bulletin, I was somewhat surprised at the facts presented therein, though I was familiar with the general situation. If there is any other branch of the mining industry conducted on such narrow, not to say dangerous margins, I should be glad, yet sorry, to know it.

When these figures are considered one must feel that if there is any mulcting of the people in the coal industry the operators are not the robber barons. And when the dividing line between profit and loss is so faint, all the more credit is due to the men in authority who are throughout all of the coal-mining regions spending thousands of dollars to reduce the hazard and improve the conditions under which the miners work.

⁂ ⁂

The Taxation of Coal Lands

By R. V. Norris*

SYNOPSIS—Former suggested basis of valuation of coal lands for taxation purposes. Valuation on a sales basis legal but unequal. The foot-acre rule inadequate, unjust and prohibitive. Valuation on a royalty basis illegal and illogical. Valuation on estimated profits objectionable and has never been applied in Pennsylvania. Conclusions—Taxation of mineral in place logically and economically wrong. Suggested basis for assessment valuation of mineral properties.

⁂

The proper method for the taxation of mineral land is, and always will be, a difficult problem. Unlike other property the value of such land is not readily ascertainable from sales and offerings, and many conditions may radically affect its true value.

The assessment of lands in the anthracite district of Pennsylvania is a good illustration of the difficulties inherent in attempting to arrive at a proper taxable value for coal lands. Up to 1907 the assessed valuations in this region, while irregular and in many cases unjust, were not so excessive as to create an unendurable burden on the industry and, therefore, were not seriously resisted. In 1907, however, a general revision of the assessed valuation was attempted and the resulting assessments were so high that they were resisted in the courts, with the result that taxes under this assessment are still in litigation, and appeals have been filed from all the later assessments, with a resulting condition of almost intolerable chaos.

The assessment of lands for taxation, in Pennsylvania, is made under acts of the legislatures of 1841 and 1842, by which the assessors are required to "assess, rate and value every subject of taxation according to the actual value thereof and at such rates and prices as the same would bring at a *bona fide* sale after due notice." In actual assessment four methods of taxation have been attempted or suggested: 1. Valuation based on actual sales. 2. Valuation based on foot-acres of coal remaining in the ground. 3. Valuation based on royalty values. 4. Valuation based on capitalized estimated profits. All of these methods have proved unequal and unsatisfactory and it is the purpose of this paper to discuss them and to point out their impracticability.

Valuation Based on Actual Sales

This method, which under various decisions of the Supreme Court of Pennsylvania is the only strictly legal one, has resulted in an almost hopeless tangle of the testimony in the tax-appeal cases. Sales have been shown from a few hundred up to over ten thousand dollars per acre, for coal land. The smaller values are usually for lands containing relatively thin coal; medium values, from two to three thousand dollars per acre, for relatively small areas with normal coal contents but unopened and not generally of sufficient area for separate operations; while excessive values, in a few cases, are for going concerns or for lands strategically located and thus having inflated values to particular purchasers.

Valuation Based on Foot-Acres of Coal

It was early apparent that the mere sale values per superficial acre, for scattered tracts, could not properly be used as a criterion of value for lands containing widely different thicknesses of coal; and in the late eighties the assessment value was based on the foot-acreage holdings of a generally average blanket thickness, arrived at by the engineers of the operating companies, who returned under oath the average thickness of workable coal remaining unmined and calculated as spread equally over the area of each tract covered by the bottom bed.

This method, while more equitable than a valuation based on superficial acreage irrespective of coal thicknesses, is unjust in that it takes no cognizance of the varying thicknesses or qualities of the different beds of coal and the radically different costs of mining the same and, further, is distinctly objected to by the Supreme Court of Pennsylvania, which says:* "The foot-acre rule for ascertaining the valuation of coal lands of the appellant, for the purpose of taxation, is not a proper measure of their value."

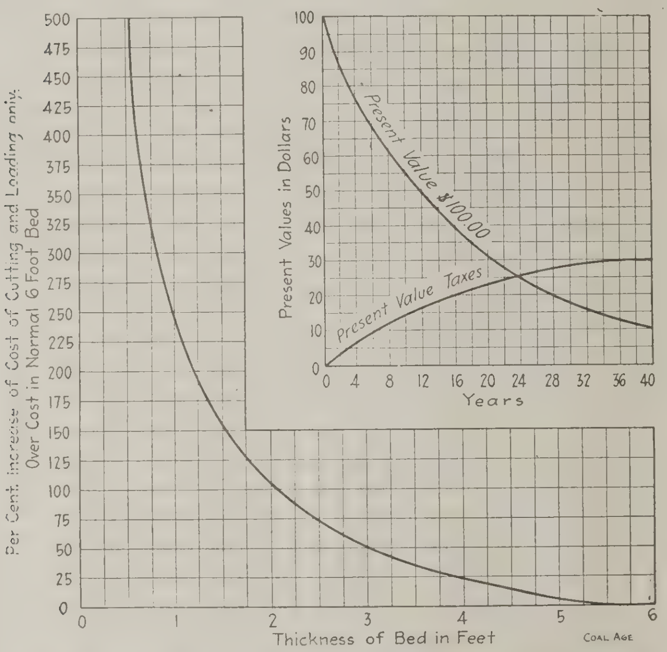
As an illustration of the extent to which the thickness and quality of coal influence its value, the following diagram is presented, which shows the increased cost, in cutting and loading only, due to decreased thickness, in one particular colliery. This does not, of course, begin to show the total increased cost of mining in thinner beds, with the necessary greater development, more extensive haulage and ventilation, longer transportation, additional pumping, and greater cost of preparation; but certainly does indicate the irrationality of an assessment based on coal contents alone, irrespective of conditions.

---

*Address delivered at the Sixteenth Annual Convention of the American Mining Congress, Philadelphia, Penn., Oct. 20-24, 1913.

*Penn. Supreme Court Report No. 229, p. 465, Reading Appeal.

The actual assessments per foot-acre, which under various subterfuges are still persisted in, despite the law as interpreted by the Supreme Court of the state, have gradually increased from about $50, to the 1913 assessment in Luzerne County, in the Wyoming field, where the assessed valuation was actually fixed at an equivalent present rate of $250 per foot-acre, or about 20c. per ton for all coal, of all sizes, estimated to be ultimately recoverable from the lands. Assuming that the average date of mining, for all coal will be but fifty years hence, and that taxes must be paid on this valuation at the rate of, say only 20 mills, the present value per ton of coal available in the ground on the basis of this monstrous assessment would be about $2.37, a figure many times greater than any possible value for mining purposes.



Diagrams Showing Increase of Cost in Thin Seams; and Valuation of Property and Taxes with Respect to Life of Mine

Valuations Based on Royalty Values

This method, which has been advocated by many engineers appears at first sight eminently logical and proper. It has been objected to, however, by the Pennsylvania Supreme Court,* and hence cannot be legally used for assessment valuation. This report says, referring to royalty basis of valuation:

> Its market value is its fair selling value for cash, not payable as royalty strung out through a long series of years, but payable at the time or as soon thereafter as the value could be determined. Such a method does not make allowance in undeveloped territory for the length of time coal may lie in the ground unmined, undeveloped and unprofitable. It is impossible to reduce to a scientific basis and to mathematical precision the elements of value entering into the present selling price of a tract of coal land. The question is not what earning power coal lands may develop in the future, but what they are actually worth in the market at present.

Further, this method presents inherent difficulties and objections, which remembering that, under the Pennsylvania Law, assessment on similar properties must be equal, appears to be insuperable. On a royalty basis of valuation, the time of mining is the controlling factor in calculating values. As an example, assume five exactly similar properties, each containing 2,000,000 tons of coal, to be worked out *seriatim,* at an average of 100,000 tons per year, each paying 30c. per ton royalty, making the annual royalty payment, during the mining of each tract, $30,000. On the basis of the Luzerne County, Penn., 1913 assessment, these properties would each have an assessment value of $400,000, and would pay approximately $8000 annual taxes, up to the average time of exhaustion. Their present values, on a royalty basis, calculated at 6 per cent. would be as follows:

Tracts	Start Mining Yr.	Complete Mining Yr.	Present Value Royalties	Less Present Value Taxes	Net Present Value
First..................	0	20	$344,100	$58,880	$285,220
Second................	20	40	107,360	110,120	12,760
Third..................	40	60	33,550	126,100	92,550
Fourth................	60	80	10,430	131,080	120,650
Fifth..................	80	100	3,250	132,550	129,300

Thus, even without any taxes, the coal held for future necessities is shown to have but small present value, and including the taxes to be paid (except the first assumed tract to be mined out within twenty years) is worse than valueless and would be held by the owners at a loss. This condition may be well illustrated by the smaller diagram showing the present values, and present tax charge on $100 to be paid at a future date, as on lands held for reserve.

Hence, the Supreme Court is unquestionably justified in rejecting a royalty basis for assessment valuations; and, taking the five example tracts above, it is apparent that, depending only on the element of time, the valuations on this basis vary from a value of $285,000 to a loss of $129,300. It is greatly to the financial interest of the owners to have the properties exhausted in the shortest possible time, practically regardless of the ultimate yield. From a financial standpoint, they are fully justified in taking only the most available and most easily and quickly mined coal, even at the cost of the utter destruction of thinner beds, which may be interstratified with the thicker ones and which would be irretrieveably ruined by the removal of larger beds below them.

Further, as a commentary on the justice and equality of an assessment based on royalty values, it is evident that a mere change of ownership, transferring a tract of coal land from a reserve for fifty years or more in the future under one ownership, to coal immediately available to another would radically change its assessed value. Also, a valuation on present royalty rates may result in absolute tax confiscation of lands leased at the going rates of many years ago, in many of which leases the taxes were covenanted to be paid by the owners, as many anthracite leases made in the sixties and seventies of the last century pay from 8 to 25c. per ton on the larger sizes only, while present royalties vary from 35 to 60c. per ton for prepared sizes, with about half these prices for pea and one-quarter for buckwheat coal.

Valuation upon Capitalized Estimated Profits

This method of valuation has been proposed, but as far as is known has never been applied to the assessment of bal land in Pennsylvania. It has all the objections aplying to royalty valuations, with the further very serous objection that the profits of mining enterprises are, nder similar conditions, largely dependent upon the ianagement that such a basis for assessment would reutl in, and unjustly penalizing good management, which ssentially involves good and economical mining with esulting lower losses and the recovery of larger perentages of the mineral in the ground.

---

*Penn. Supreme Court Report No. 299, p. 470.

Conclusions

It appears that none of the suggested or attempted nethods of assessment have resulted or can result in an equitable valuation, fair and just to both the public and the owners of coal land; that even moderate taxation of the coal in the ground is opposed to all principles of conservation, as its effect is to put a tremendous premium on rapid mining almost regardless of ultimate recovery and to encourage the destruction of poorer and thinner beds interstratified with the better ones because of the enormous penalty entailed in slower mining, and because such taxation acts to discourage, by prohibitive penalties, the holding of lands in reserve for the future necessities of the people.

For these reasons, it appears that the taxation of mineral in the ground is logically and economically wrong, leading as it does to the rapid and uneconomical exhaustion of the mineral wealth of the country, and putting a premium on premature and wasteful exploitation. The proper method of taxation for all minerals appears to be *a tax based on the value at the mine of each year's product, at the local rate of taxation assessed for that particular year, including an assessment on surface lands, outside improvements and machinery, the value of which is readily ascertainable; but not including any valuation of mine openings or inside improvements, which are incidental to the mining process and which after the exhaustion of the mineral are of no value.*

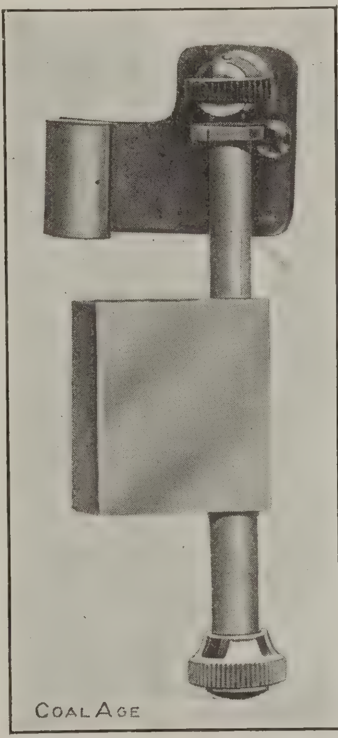
Thus, a colliery producing 1,000,000 tons of anthracite in 1912, with a value at the mine of, say $2,500,000, and with surface and improvements valued at $1,500,000, should pay taxes for the year 1913, on $4,000,000 assessed valuation, regardless of the area of coal land tributary to such a colliery; and if, for any cause, the production in some later year should fall to $1,000,000 in value and the value of the surface and improvements decrease to $1,000,000 the taxes for the following year should be assessed on a $2,000,000 valuation.

This suggested method of assessment and taxation of coal lands is, of course, clearly illegal under the present laws of the state of Pennsylvania; and its adoption would require special legislation to put it in force. Also, while not absolutely just, in that it assesses coal from thin and impure beds that are costly to mine, at the same rate as that from the more cheaply mined thick and pure beds, the plan would, if legalized, possess the inestimable advantage of doing away with all uncertainty and litigation as to assessed valuations; result in the payment of taxes in greatest amount at the times of greatest production and consequent greatest population and public need for money; and, by concentrating taxation on the land most actively worked and relieving reserve land from its present crushing burdens, would tend to the conservation instead of the dissipation of the irreplaceable coal resources of the country, by encouraging the complete mining of lands when once opened, including all workable beds large and small, rather than encouraging the opening of the best beds, on all lands, to obtain immediate returns and avoid the burdens of accumulating taxation, even at the cost of the destruction of smaller and less valuable beds lying above the larger ones.

⁂

A Good Friction Igniter

The Vaughn-Miller safety-lamp igniter, recently placed on the market, combines some qualities that recommend it strongly to users of the Wolf or the Siple naphtha lamps. The igniter fits both of these lamps and is quickly inserted without difficulty or alteration of the lamp.



A Friction Igniter

This igniter, which is shown in the accompanying figure, is the invention of L. D. Vaughn, mine inspector, third district, West Virginia. Mr. Vaughn has had 42 years' experience in mines and has made a close study of the question of safety lamps. In his igniter he has employed a carborundum cart. [illegible] said to give 5000 flas [illegible] and can be replaced when worn out, at slight expense. One of the features of the igniter that insures the ready ignition of the wick of the naphtha lamp is the fact that the spark, which produces the ignition, is thrown horizontally against the wick. Another feature of this igniter is that when not in use it is lowered in the lamp, so that it will not obstruct the light. All that is necessary to relight an extinguished lamp with this igniter, is to push up the small rod that extends down through the bottom of the lamp, and twist it sharply to the right. A small spring keeps the cartridge pressed against the friction wheel of the igniter.

While this igniter has been on the market for several months, and has given good satisfaction, the sale has not been pushed until now, awaiting the results of tests made by the Bureau of Mines. The circular states that, on Aug. 14, this igniter was subjected to a series of rigid tests by the Bureau of Mines, at Pittsburgh, Penn. In an 8½ per cent. mixture of gas and air, in still air, 500 continuous flashes of the igniter in a safety lamp failed to ignite the gas outside of the lamp, the gas burning in the combustion chamber and filling the lamp with flame. Following this, the same tests were made in 600-ft., 1000-ft., 1500-ft. and 2500-ft. velocities of the air current, the last named being the highest velocity attainable at the testing station. In these tests of more than 500 flashes each, the lamp was continually filled with flame, which, however, did not pass the gauze, although the latter, in the last-named test, was almost at a white heat.

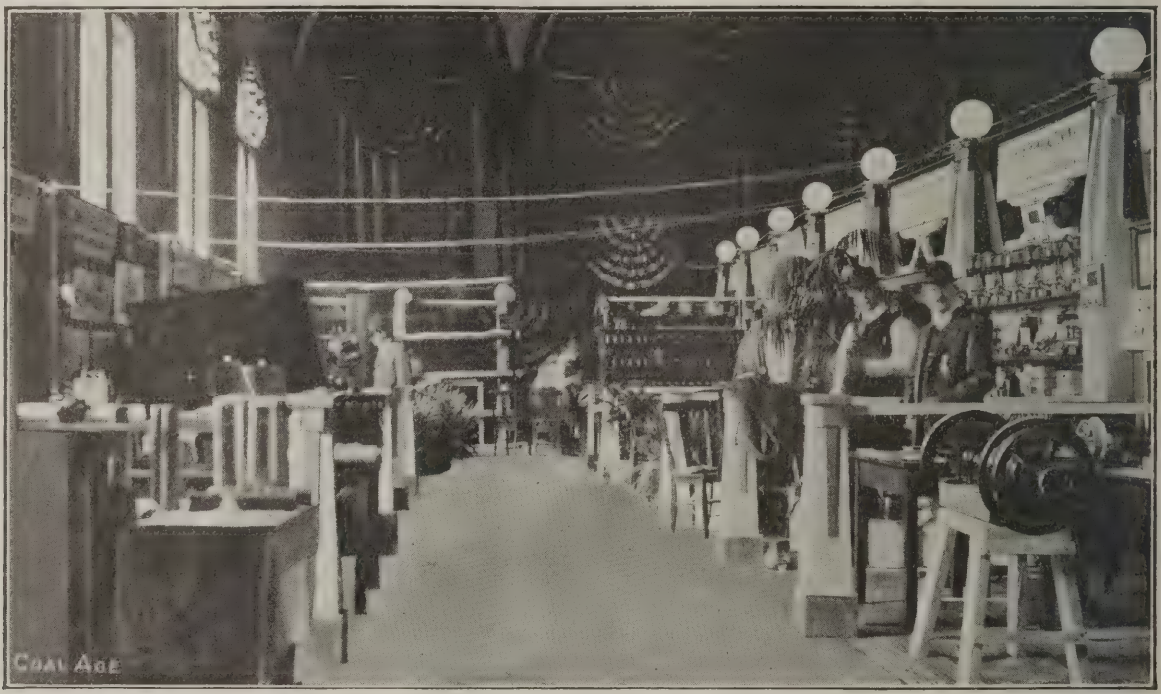
An Interesting Exhibition

SYNOPSIS—A trip through the machinery exhibition held in connection with the American Mining Congress in Philadelphia. Various machines and appliances used directly and indirectly in the production of coal were here seen to good advantage.

⁂

The machinery exhibition carried on during the past week in connection with the American Mining Congress in Philadelphia, although perhaps somewhat disappointing in the matter of attendance, was both interesting and instructive. The exhibits shown occupied two floors of Horticultural Hall; the heavy machinery being placed upon the first floor, and the lighter apparatus above.

Upon both floors the exhibitors' booths were arranged along the outer walls of the building or placed back to back in the room. Three aisles were thus formed upon each floor with exhibits upon either side.



Looking Down One of the Aisles

Entering the right hand aisle on the second floor, the first exhibits seen were those of the Commercial Museum of Philadelphia, and the University of Pennsylvania. The next exhibit was that of J. S. McChesney & Co., of Chicago, Ill.; this consisted of mine supplies and wire hose ties. Beside this booth was that of the American Abrasive Metals Co., of New York, which exhibited floor plates and locomative brake shoes.

The next booth was that of the Draeger Oxygen Apparatus Co., of Pittsbugrh, Penn. Here the oxygen helmet and mouth piece breathing apparatus were exhibited in proper working order upon suitable wax figures. A pulmotor was also shown with its various attachments and attracted no small amount of attention from visitors.

Passing on down the aisle the visitor arrived in succession at the booths of Adam Cooks Sons, of New York, lubricant makers; the Ball Engine Co., of Erie, Penn. manufacturers of high grade engines; and the Davis Instrument Manufacturing Co., of Baltimore, Md., wher a collection of high-grade anemometers and hygrometer might be seen.

The next exhibit was of the Scott rivetless manil transmission-rope sockets used in joining the ends c transmission rope. By means of these sockets, which ar steel drop-forgings, a rope can be spliced in approximat ly 45 seconds, whereas several minutes are required t do the same work with a riveted socket. These socke are manufactured and sold by John G. Scott, of Girar ville, Penn.

The Witherbee Ignitor Co. had the next booth and exhibited their storage battery and cap lamp. The exhibit consisted of the lamps, batteries, cases, wire, e showing clearly the method of manipulation of the lamps. Directly across the aisle was the booth of Ack royd & Best, Inc., of Pittsburgh, Penn., who had a go display of safety lamps and accessories.

At the extreme end of the passage was the exhibit o the Electrical Service Supplies Co., of Philadelphia Penn. This consisted of Keystone truss pins, lock in sulators, lamp-guards, porcelain strain insulators, protected rail bonds and the compressor for same, an au motoneer, Gargon-Daniels lightning arresters, a Keystone mine signal, also a mine telephone, an illuminate enameled "Safety-First" sign in several languages, Crouse-Hinds mine headlight, and an extensive line electrical material and specialties.

Along the second or center aisle of the building wer the following exhibits: The Fairmont Mining and Machinery Co., of Fairmont, W. Va. This consisted of small mine pump geared to a motor, both machines be ng mounted upon a mine truck for portable operation; a short section of track laid with this company's steel mine ties; also a model of a car retarder to facilitate oading railroad cars under tipples.

The next three booths were occupied by the Keystone ubricating Co., of Philadelphia, with an exhibit of rease and grease cups, the Cyrus Borgner Co., of Philadelphia, with a nice exhibit of fire brick and clay products, and the West Virginia Rail Co., of Huntington, W. Va., with an exhibit of rails and fishplates.

The next booth was occupied by the American Steel & Wire Co., of New York. Here specimens of wire cables for aerial tramways, together with the travelers and grips used in this type of transmission were shown. Not the least interesting part of this exhibit was a joint in a lock-coil cable.

The Bureau of Safety Relief Sanitation and Welfare of the United States Steel Corporation exhibited photographs of welfare work, a special type of stretcher, etc., in the next booth, while the one next to that was held by the Universal Portland Cement Co., of Chicago, Pittsburgh and Minneapolis. Here were shown specimens of crushed limestone, granulated blast-furnace slag, a mixture of these raw materials, portland cement clinker and the finished cement.

Exhibit of the Draeger Oxygen Apparatus Co.

Directly across the aisle from the exhibit of the Universal Portland Cement Co., was that of Johnson & Johnson, of New Brunswick, N. J. This was one of the most complete exhibits in the entire show, and consisted of various materials and appliances used in first-aid work, and also the first-aid cabinets, such as are kept ready for immediate use at many mines. The next booth was that of Henry Troemner, of Philadelphia, with a display of various sizes of laboratory scales and balances, while the Atlantic Refining Co., of Philadelphia and Pittsburgh, had an extensive exhibit of petroleum products in the next booth. Here was shown a working model of a series of oil wells pumped from a central station. A mine car wheel lubricated with some of this company's oil was kept continuously running (being belted to an electric motor) at the rate of approximately 30 miles per hour, and the journal box was absolutely cold.

The next exhibit was that of the Hazard Mfg. Co., of Wilkes-Barre. This firm is the maker of wire cables and hoisting rope. One of the most interesting parts of this display was a piece of hoisting rope which had broken loose accidentally from the drum of the engine and fallen down the shaft, and in so doing had become twisted and tied into an intricate knot, with many sharp bends. Despite this fact, however, a close examination of the rope failed to show the breaking of a single strand or wire.

The next booth was occupied by the Koehler Mfg. Co., of Marlboro, Mass., with an attractive display of safety lamps and igniters. The igniters above mentioned are built into and made a part of the safety lamps, and are so arranged that should for any reason the lamp become extinguished, the simple turning of a rod or thumb screw under the base of the lamp will cause a shower of sparks to fall upon the wick, reigniting it without the necessity of taking the lamp apart or of striking a match.

The Western Electric Co. in the next booth had a fine display of mine telephones for both surface and underground work, mine rescue telephones and the like.

The Hirsch Electric Mine Lamp Co., of Philadelphia, had the next exhibit in the side aisle. Here a small battery-charging plant was shown in operation. This consisted of a rack provided with suitable holders and terminals or fingers touching the terminals of the batteries.

The Streeter-Amet Weighing & Recording Co., of Chicago, exhibited in the next booth their automatic weight recorders for tipples, together with several photographs of various installations; while John Roeblings Sons, of Trenton, N. J., had the display adjoining. Here were shown steel cables and hoisting ropes and electric conductors.

The Justrite Manufacturing Co., of Chicago, Ill., occupied the next booth. An attractive display of various kinds and types of carbide lamps and lanterns with many unique features might here be seen. Among these latter might be mentioned a lamp which required no match to light, a vest pocket lamp-lighter and an ingenious pocket device for cleaning out the gas hole in a lamp tip.

The next exhibit was that of the American Concentrator Co., of Philadelphia. This firm is the manufacturer of coal and iron-ore preparation plants. No less than 13 types of jigging machines are built by this company, also magnetic separators, and to the best of their knowledge the only commercially successful centrifugal coal dryers upon the market.

The Lobdell Car Wheel Co., of Wilmington, Del., had a display of mine-car wheels and axles for locomotives in the next booth.

In the booth directly across the aisle from the one last mentioned, Keuffel & Esser Co., of New York, had an extensive and interesting display of surveying and drafting instruments. Among other devices of interest to mining men, they showed an improved anemometer with an increased range of accuracy. In the booth immediately adjoining this was a display of chemicals by Roessler & Hasslacher Chemical Co., of New York.

The Edison Storage Battery Co., of Orange, N. J., had the adjoining booth. Here were shown various sizes and types of the Edison storage battery varying in size from the single-celled battery for miners' head lamps to a 56-cell unit suitable for use on a mining locomotive.

The Link Belt Co. had the next booth. Here were shown photographs of various applications of this firm's hoisting and conveying machinery, covering practically the entire coal-mining field.

The Main Belting Co., of Philadelphia, occupied the remaining space upon this floor. Here was shown an apparatus demonstrating that Anaconda belts would carry wet material. A conveying belt was also exhibited which was approximately 8 ft. wide.

Upon the lower floor of the building the Jeffrey Mfg. Co. exhibited a 60-hp. storage-battery and trolley locomotive. This machine was designed as a combination haulage and gathering motor. A heavy-duty short-wall mining machine, a single-roll coal crusher, and Hess-Bright ball bearings as used for locomotive armatures were also shown.

The Goodman Mfg. Co., of Chicago, displayed a coal puncher driven by an electric motor, and built in 1888. Also a five-ton gathering locomotive with cable reel, and a short-wall coal cutter.

The Milwaukee Locomotive Co., of Milwaukee, Wis., had on display a seven-ton, 35 hp., gasoline locomotive. This machine was equipped and driven with an engine of four cylinders, each 6x6 in.

The Baldwin Locomotive Works and the Westinghouse Electric & Mfg. Co. exhibited an electric locomotive equipped with both the ordinary or straight trolley pole, and a jointed or type D-20 trolley. This machine was ten tons in weight, and equipped with an 86 h.p. motor. It was built with the bar-steel side frame.

An Elaborate and Attractive Exhibit

The Electric Storage Battery Co., of Philadelphia, exhibited their iron-clad exide battery for motor vehicles. A complete unit of 20 cells was here on exhibition.

A working model of an over-wind and over-speed controller was exhibited by the Welch Hoisting Controller Co., of Pittsburgh. This was a miniature hoisting engine, provided with a model of a shaft and head frame. The engine was equipped with a controlling device which effectually prevented either over-winding or over-speeding.

The Alexander Milburn Co., of Baltimore, had a good display of carbide lanters and headlights, and devices for illumination when isolated work must be done at night, or in dark places.

The exhibit of the General Electric Co. consisted of photographs of various installations which had been made, while the Williams Patent Crusher & Pulverizer Co., of St. Louis, had a full-sized crusher in working order and equipped with an improved belt pulley, also a small finished cylinder showing the arrangement and attachment of the hammers.

The C. O. Bartlett & Snow Co., of Cleveland and New York, had upon exhibition a large-sized working model of their coal-handling machinery.

The Hyatt Roller Bearing Co., of Newark, N. J., had an interesting exhibition of their roller bearings as applied to mine car wheels. They also showed the rollers, cages and bushings, separate from wheels of any kind.

The Lead Lined Iron Pipe Co., of Wakefield, Mass., had on display various lead- and tin-lined fittings, and sections of lead- and tin-lined pipes, while the Vulcan Iron Works, of Wilkes-Barre, Penn., showed photographs of their various installations, the attendant being ready to answer any questions which might be asked.

As stated in the beginning, the exhibition in whole and in detail was both interesting and instructive. It was well worth anyone's time to pass through the various rooms and see the types of machinery which are used in the mining and preparation of coal. The tools and appliances here shown were of course the most modern and up-to-date that are in use at the present time. Most of the articles exhibited, with the exception, of course, of the models, were stock materials and not built or finished especially for the occasion.

⁂

The True Romance

By Berton Braley

From "American Machinist."

"Romance is dead?"—The Foreman smiled
As he would at the words of a foolish child;
"Romance is dead?"—Why, man you're blind—
If you'd listen and learn with an open mind
Instead of speaking in parrot phrase
Of the 'grand old times' and 'the good old days;'
If you'd look about you and SEE, you'd find
Romance is living right now and here,
Not dead and gone with the yesteryear!

"Man, O man! can't you look and see
What thousands of wonders have come to be?
These bolts and shafting that whirl and whir,
These chunky motors that hum and pur,
These lathes and punches which fill the floor
These hammers pounding, these rolls that roar,
Why—THEY'RE Romance—and they make it, too,
By the magic spell of the work they do;
These tools of ours and the men who run them,
Don't DREAM of miracles—they've DONE them;
They've put Romance in the shape of steel,
They've turned the shafts and they've forged the keel
Of many a ship that fights her way
Through surging combers and flying spray;
The train that thunders along the rails,
The ax that blazes the new-made trails,
The cages that carry the miners down,
The dynamos lighting the clanging town,
The aëroplane in the sky's blue dome,
The plowshare, turning the good brown loam,
The myriad wonders of the time
Have sprung to life from the workshop's grime;
And yet you sigh, and you shake your head
And murmur sadly, 'Romance is dead!'"

Coal-Mine Accounting Systems

By J. B. L. Hornblower*

SYNOPSIS—Some comments on accounting methods in general with particular reference to those of the Pittsburgh Coal Co. Systems of accounting vary widely with different companies and may lead to a great deal of confusion. Plant and equipment depreciation are especially troublesome items to handle intelligently.

⁂

It is with some misgivings that I undertake, at the request of the officers of this Convention, to lead in the presentation of the subject "Mining Costs"; not that the subject is one unworthy of your time and attention, nor that my study of it has been meager or superficial, but because the matter of the proper construction of mining cost accounts and the use of the same by those vitally interested does not usually receive the attention and consideration which it deserves. Perhaps this fact influenced your officers in introducing a paper on the subject and inviting your attention to its consideration and discussion. However this may be, I believe that the subject is one of great importance and I therefore have consented to discuss it, more in the hope of emphasizing certain things, than of presenting any new or startling views upon it.

First. Who are interested in mining costs? The foremen, superintendents, general managers, executive officers, boards of directors and stockholders. The viewpoints of these respective classes are different, but all are, or should be, greatly concerned to secure the truth, the whole truth and nothing but the truth. Carelessness and indifference as to statements made are, in the last analysis, of the same texture as wilfullness and misrepresentation and frequently lead to the same disastrous results.

Second. How may these statements be made to most accurately and clearly set forth the information concerning actual conditions, which is so necessary to those whose capital and reputations are at stake?

The limit of time you will fix for the consideration of this subject, among the many other important matters which are to engage your attention, makes it necessary for me to avoid details as much as possible—to outline rather than elaborate.

INTEREST AND TAXES

Interest on capital invested in lands, mining rights, plants and equipments, and discount on bonds issued against such investments, should not be charged to mining cost. Interest on bonds sold for the purpose of constructing specific plants is commonly charged to such construction cost up to the time when the plants are ready for operation, but this practice easily runs into an abuse and a misrepresentation to bondholders, stockholders and the public.

An operating company will not err but rather commend itself to all concerned by holding to an absolute rule not to capitalize interest under any circumstances. Many companies in the past, which sold bonds for less than face value, charged such discount to property or construction account, but this practice is now less common and will doubtless gradually disappear in companies which wish to be credited with conservative management and frankness in reports to stockholders and the public.

Taxes in an operating company should be charged to operations, never to property. The amount of tax chargeable to the operation of a given mine ought to be, as nearly as may be, the tax upon the land which will ultimately be operated through that mine, and the tax for a given year should be apportioned in equal amounts over the divisions of the year for which cost statements are made.

ROYALTY OR PROPERTY DEPLETION

The value of coal or mineral rights, at cost, should be extinguished at a charge to operations in a fixed amount per ton or per acre as the property is exhausted. Some companies have revalued lands on their books and so created a surplus. This, in probably every case, was not a wise thing to do. Assuming that the transaction was thoroughly honest in intent, properly shown on the books of the company as a surplus not derived from operations, and properly followed up by increased charges to future operations for exhaustion, it will appear in the last analysis to be simply reaching into the future.

I would say, therefore, that while such revaluation in some cases may seem to be justified, in most cases it is a thing which ought not to be done. If the lands are really worth more from year to year than their first cost, the fact will be reflected in increased selling value of the product. The difference of value, believed or hoped to exist, ought not to be put into surplus account in advance of actual sales of product, thereby increasing, in a fictitious way the mining cost of the future. In other words, it is wiser and more conservative to book earnings as they are actually realized, not as anticipated or hoped for.

DEPRECIATION OF PLANT AND EQUIPMENT

There is, perhaps, no single phase of accounting, whether of mining or manufacturing companies, more complex or troublesome, than this matter of plant and equipment depreciation; hence nothing in which there are more differences of opinion and method of procedure among operating companies and I might add, nothing in which managements and accountants more easily, and with the best intentions, deceive themselves and each other. The views, plans and methods herein set forth are, therefore, not necessarily standard—they are more or less the result of my personal study and experience.

Up to the time when a mine is placed on an operating basis, ready to produce the daily tonnage for which its development, plant and equipment were planned (regardless of what it actually does produce at that time, determined perhaps by the law of supply and demand, labor or weather conditions or car supply) all expenditures for development, plant and equipment should be charged to construction account with credit to that account for product sold in the full sum realized for the same. After the projected development has been completed and the mine placed on an operating basis, all expenditures made during the whole course of its life, whether for development, air shafts, mine cars, power equipment or lines, or anything that may be installed, should be charged to operations, unless such expenditures result in positive increase of capacity; in this case they may be charged to capital investment with a proper regard to the question of the length of time that such additions may reasonably be expected to serve.

---

*Comptroller, Pittsburgh Coal Co.

Note—An address before the 16th annual convention of the American Mining Congress, Philadelphia, Oct. 20 to 24, 1913.

Further charges should be made to mining cost monthly in fixed uniform amounts, with credit to a fund account generally known as plant and equipment depreciation fund, for the replacement of capital originally invested in such development, plant and equipment, or for the replacement of units which wear out or become obsolete. The extent to which this fund may be used for replacements or renewal in kind must be determined by the rate at which the fund is accummulated. If the rate is low and a long period, perhaps the entire life of the mine, is consumed in charging operations with the full amount of the original investment (less salvage), obviously no replacements or renewals should be charged against or paid out of the fund; all must be charged to operations. If the rate be made high enough so that a much shorter period is consumed in getting into the fund the full value of the original investment through charges to operations, certain replacements, renewals, or improvements may be charged against the fund.

The company with which I am connected now follows the uniform rule of charging operations with depreciation of plant and equipment at the rate of 6 per cent. per annum on net (or reducing) values, with credit to depreciation fund. This will cover into the fund about 70 per cent. of the original value in twenty years; it is contemplated that salvage values, that is, the values of all equipment scrapped, or removed for use at other points during that period, together with the remainder value, credited to the fund will make up the 30 per cent. of balance of original value not charged to operations.

We, therefore, do not charge any renewals or replacements against our depreciation fund accumulation, but charge them all to operations; when the charges are so large as to seriously impair monthly comparisons of cost they are spread over the operations of a few months.

Labor, Supplies and Fuel

In the Pittsburgh coal-mining district, labor costs fall into two general divisions: First, that which is paid on a unit basis of work performed, such as the scale rate for pick mining, machine mining, subdivided into cutting and loading, and dead work, such as yardage, room turning, breakthroughs, clay veins, etc.; and, second, that which is paid on a pier diem basis, such as motormen, drivers, general inside labor, tipple labor, general outside labor, electricians, etc. It would hardly be profitable to follow the subdivisions of labor in this paper; they differ, of course, with changing conditions.

All expenditures for live stock and supplies, after the initial installation at a new mine, should be charged to operations as made. For purposes of checking, and accuracy in monthly comparisons of cost, inventories should be taken at the close of each month and entries made debiting inventory account, with credit to operations, for unused supplies at cost and for live stock in the service at a fair valuation, taking to account wear and tear.

The mining-cost statement at a mine depending upon its own power plant, which does not include a charge for coal consumed in the same is incomplete and apt to be misleading in comparisons with mines purchasing power from central stations. For this reason it is proper to charge the fuel at a representative value to operations with credit to coal-sales account, notwithstanding that operations have already been charged with all the items entering into the cost of the product so consumed. This treatment of the individual power-plant fuel, of course must not be lost sight of in the general summary of business done.

Insurance and General Expense

Fire, tornado, boiler and employer's liability insurance premiums are increasingly important as items to be taken to account in mining costs whether these hazards are covered by insurance companies or assumed by the operator. In the latter case a fund or funds should be created and maintained at a charge to operations in sufficient amount to pay all losses, and, conservatism suggests, to accumulate a reasonable surplus.

General office expense and other general expense should be incorporated in mining-cost statements in order to get a total outside amount of cost upon which to base selling values; they should, however, be shown separately under appropriate headings, not being included in any of the subdivisions of "Cost at Mine." In a company conducted exclusively as a mining company it is, perhaps, better not to differentiate nicely between that portion of general office expense, which is chargeable direct to mining, such as the operating and engineering departments, and the expenses of departments of sales, transportation, finance accounts, etc. In a broad sense, the base of all the company's business is the production of its mines, hence all of its general office expense may properly be included as a part of its total mining cost.

An Improved Anemometer

One of the most common and yet most important, intruments, in mining practice, is the Biram anemometer ith which every mine foreman is familiar. This intrument is to the mine foreman what the Davy lamp s to the fireboss—his constant companion. Many of the eatures of the old Biram instrument have always proved source of annoyance and error. Owing to these deects, which were often unappreciated by the foreman sing the instrument, it was common to find frequent lisagreement in the results obtained by the use of differnt instruments.

It is well known that this instrument, as formerly designed, would gradually fail by use; in other words, it would not stand up to its calibration, owing to the tendency of the twisted arms supporting the blades to untwist. This would cause the instrument to record a higher velocity than the actual. Another source of error was due to the fact that the dial hands did not cease to move instantly when the instrument was thrown out of gear. In some makes of these instruments, this formed an important defect; also the jewel bearings used were subject to considerable wear, in the hard usage common to mining practice.

A careful study of these defects has enabled the Davis Instrument Manufacturing Company, Inc., to design an instrument that is destined to give universal satisfaction. The movement is American, manufactured in the shops of the company, at Baltimore; and is peculiarly the design of Alfred U. Davis, vice-president of the company and superintendent of the shop. It will be remembered that the father, Herbert Davis, was formerly the American reresentative of the English firm, John Davis & Sons, where Alfred Davis served his apprenticeship before coming to this country.The latter has since been employed in the shops of the General Electric and the Westinghouse companies.

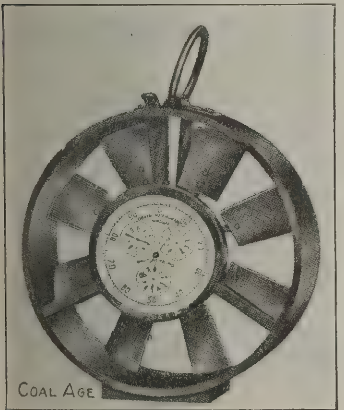

Fig. 1. The American Davis Anemometer

The American Davis anemometer, shown in Fig. 1, like the American watch movement, is standardized throughout, and each individual part is quickly replaceable, making the instrument easy to repair, in case of breakage owing to accident. An important feature in this instrument is that the arms, which are of hollow brass, are stamped at the proper angle to receive and hold the aluminum blades. The system of manufacture, in this respect, is so complete that the finished instrument needs no calibration; but when tested, as every instrument is tested before leaving the shop, the reading is found to be correct. This fact alone shows the precision of the system. Instead of jewels, the bearings are steel on hard bronze, which give greater permanency and satisfaction. These instruments, unlike others, do not give increasingly higher readings with continued use, and stand up better to their performance in the higher velocities common to mining practice. By an ingenious arrangement, the dial hands are brought to rest instantly when the instrument is thrown out of gear.

Have Stood the Tests

An interesting feature in connection with these instruments is the manner in which they have stood the tests of the Bureau of Standards, at Washington, D. C. The instrument is calibrated for an exact reading at a velocity of 500 ft. per min. In common with other anemometers, the dial readings, for higher velocities, are in excess and, for lower velocities, fall short of the actual.

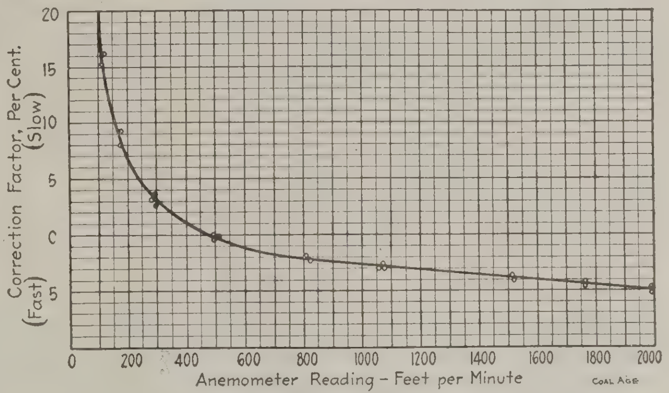

Fig. 2. Diagram Showing Percentage Correction of Anemometer Readings

The accompanying diagram (Fig. 2) shows the corrections to be made for such higher or lower velocities. For example, the dial reading of 500 ft. per min. is correct and corresponds to the actual velocity of the air current. A dial reading of 800 ft. per min. must be reduced 2 per cent., giving an actual velocity of 784 ft. per min. In the same manner, a velocity of 2000 ft. per min. must be reduced 5 per cent., giving a velocity of 1900 ft. per min. On the other hand, a velocity of, say 160 ft. per min., must be increased 10 per cent., giving an actual velocity of 176 ft. per min. The test of the Bureau of Standards corroborated this chart and the calibration of the instrument in a remarkable manner, as shown by the small circles that indicate the results of the test at several different velocities.

COMING SOCIETY MEETINGS

The Coal Mining Institute of America will hold its winter meeting at the Fort Pitt Hotel, Pittsburgh, Penn., Dec. 4 and 5. C. L. Fay, Wilkes-Barre, Penn., is secretary.

The Rocky Mountain Coal-Mining Institute has decided to postpone indefinitely the November meeting which was booked for Denver. This decision is due to the serious strike situation which now exists in Colorado. F. W. Whiteside, Denver, Colo., is secretary.

The Engineers' Society of Western Pennsylvania will hold its bimonthly meeting in the Society Rooms, Oliver Building, Pittsburgh, on Tuesday, Nov. 4, at 8 p.m. The subject of the meeting will be, "Design of Linings for Mine Shafts," by W. A. Weldin, assistant chief engineer of the Pittsburgh-Buffalo Co. Discussion will be presented by a number of structural and mining engineers. Elmer K. Hiles, Oliver Building, Pittsburgh, Penn., is secretary.

The Engineers' Society of Western Pennsylvania and the **Cleveland Engineering Society,** at the invitation of the Pressed Steel Car Co. and the Universal Portland Cement Co., will inspect the works of these two companies Saturday, Nov. 1.

West Virginia Coal Mining Institute will hold its winter meeting at Charleston, W. Va., on Dec. 8, 9 and 10. Neil Robinson, Charleston, W. Va., is president; E. N. Zern, Morgantown, W. Va., is secretary.

Session of the American Mining Congress

By R. Dawson Hall

SYNOPSIS—The congress discussed the various politico-economic aspects of mining, such as the taxation of mining property, the sale of public mineral lands, the inadequate returns in the coal industry, the wages of labor and workmen's compensation. Carl Scholz was elected president. The association showed its interest in the promotion of broad national policies regardless of mere personal interest and manifested a sentiment in favor of governmental regulation which should control the profits and operating methods of all mines so as to protect the public and conserve resources.

⁂

The American Mining Congress opened its 16th Annual Session on the afternoon of Oct. 20, in the ballroom of the Bellevue-Stratford Hotel. The meeting was called to order by F. H. Wigton, chairman of the local executive committee. After a few opening remarks, an eloquent address of welcome was delivered in the name of the mayor and citizens of Philadelphia by Ed. F. Cattell, statistician of the city. Mr. Cattell was associated in a mining capacity with D. W. Brunton in his earlier years.

Members and Delegates of the American Mining Con

Responses were made on behalf of the congress by D. W. Brunton, the president, and by the following representatives of the states taking part in the meeting: W. Malmey, of Alaska; W. H. Fluker, of Georgia; C. J. Norwood, of Kentucky; I. R. Burton, of New York; H. N. Lawrie, of Oregon; I. Broman, of Texas; Neil Robinson, of West Virginia, and P. J. Quealey, of Wyoming.

In the evening session, D. W. Brunton, of Denver, Colo., delivered his presidential address, and the members spent the balance of the evening at a theatrical performance.

Taxation on Output

On the following morning the congress met at 10:30 and R. V. Norris opened the meeting with a paper on the taxation of mining property. He reviewed the systems in use for assessing property and asserted that, though not conformable with the state constitution, the most correct method of assessment was by basing the taxes on the value of the output. He was not indisposed, however, to admit that such a method of taxation was open to criticism. It appeared to him as the best solution of a much vexed problem. Speaking, of course, from an anthracite standpoint, his conclusions could not be subjected to severe criticism, for most of the land is held in that section for future development, but in the bituminous fields the exemption of lands from taxation, which were not being worked, would render the holding of land for speculative purposes a more profitable business than it now is. Some sections of the country are already sufficiently retarded in development by speculators.

It is true, however, this delay assures us that when mining does commence, proper conservation of resources will have replaced present wasteful methods and moreover in places where mining is already commenced, there will be less waste of mineral as a result of reduced pressure from taxation. The present system tends to put a premium on rapid and incomplete exhaustion of resources, so that only the best of the mineral is removed.

Antiquated Tax Laws

D. L. Webb, of Denver, Colo., then read a paper, in which he said that taxation of mines was based on laws which were originally framed to apply to surface lands only. The value of mineral below ground is so uncertain that taxation should be not on the value of the holding, which is largely indeterminate, but on the value of the net output only. Taxes on mineral as land might be fixed at $5 per acre, but any larger tax should be based on mineral extracted and sold.

H. L. Smyth, of Cambridge, Mass., declared that the Minnesota taxes formerly ran 10c. per ton of output; this dropped slowly by steps to 1c., and finally was entirely removed. The specific taxes per ton were considered inequitable because they did not bear any reference to costs of production nor were they related to the value of the product obtained.

The Finlay System

The J. R. Finlay valuation is now generally acceptable, though made after too hurried an inquiry and having needed some modification. A change was desired and applied to his rules relative to the calculation of resources in depth and extent. Two suits are pending relative to his assessments. Although the burden of taxation was increased throughout the state from three- to twenty-fold, the mine operators realized that the taxes were based on a rule which would prevent exorbitant taxation, such as might be levied if the tax were dependent not on probable profits, but on output. Moreover, as the assessment was state-wide, there was now no fear that unequal taxation would result from divergences in local judgment of property values.

Taxes on Profits

W. L. Griffiths spoke in favor of taxes on output, saying that the burden should be placed, for the larger part at least, on the going concerns. Coal lands which were idle should not be taxed. A tax on profits would be welcomed by some coal companies in the anthracite region as they would escape such a burden entirely, seeing that mining was pursued year after year at a loss, the deficit being made good by railroad profits.

mbled outside Bellevue-Stratford Hotel in Philadelphia

H. M. Chance, of Philadelphia, Penn., read a paper on taxation of a character so comprehensive that it is impossible to brief his remarks. E. T. Conner, of Philadelphia, Penn., who was scheduled to speak in reply to the three papers, was unable to be present. He is laid up in the Hahnemann Hospital with appendicitis.

Interminable Mine Reports

S. A. Taylor then read a paper on "Uniform Requirements for Official Mine Reports," in which he said that there was excessive duplication in state and federal reports, so that it took a clerk 2 to 3 weeks each year to make the required returns. He proposed a consultation so that even if a number of reports had to be rendered, they would all follow similar lines, be based on the same period of time and so be mere replicas one of the other. He paid a tribute to the rapidity with which the statistical reports of the United States Geological Survey were produced.

In the afternoon the members took a trip to the League Island Navy Yard and other points of interest in the harbor of Philadelphia. When the evening session opened W. H. Wilson, engineer-in-charge of the Pittsburgh Station of the Bureau of Mines, urged the congress to join with all the other coal- and metal-mining bodies in meeting with the American Mine Safety Association, once every three years, and specifically in 1914, at a time and place to be determined at their mutual convenience.

Use of Explosives

Later R. W. Gunnell, of the Atlas Powder Co., gave a talk on "The Use and Abuse of Explosives." Mr. Gunnell said that the efficient and safe use of explosives was so important as to justify the continuous employment of an explosives' engineer by all large mining companies. He declared that the low-grade ammonia and gelatin explosives were least sensitive to shock and should therefore be fired by the strongest of detonators. Where different types of explosives are in use, the detonator chosen should be fitted for the least sensitive and not for high-grade dynamites.

Nos. 3 and 4 detonators have passed out of use almost entirely, and No. 5 will probably soon follow. Nos. 6 and 7 will be preferred and possibly No. 8 may be extensively used, for only a strong detonator and one fully equal to its work will effectually obtain the full power of the explosive used. Single-tape fuse is not recommended, for, though it is well suited for dry holes, it may, and probably will, find its way into wet places and then not being waterproofed may cause misfires.

Why Dynamite Is Not Moisture-Proof

By picking out the white crystals in dynamite and exposing them on a window sill for a few hours, it will be easily understood why dynamite is susceptible to moisture. In a short time the crystals will attract enough dampness to form a mass of water. The crystals are nitrate of soda or nitrate of ammonia and not parts of the dynamite proper, but are invariably found in the commercial article.

But there is another reason why dynamite is not absolutely resistant to moisture. The absorbent material is more willing to soak up water than nitroglycerin, and a certain 10 per cent. dynamite was found recently on analysis to have replaced 4 per cent. of the explosive material with water. At about 43 deg. F., dynamite will freeze and can be detonated only with difficulty or not at all, depending on the degree of solidity with which it is frozen. Blasting caps are cheaper than electric fuses and have no other advantages, the more expensive article giving far safer results in practice.

When the Fan Should Be Stopped

At the close of Gunnell's address, a paper was read on "Mine Rescue and First-Aid Operations," by J. W. Paul, engineer in charge of mine-rescue work of the Bureau of Mines. He made several interesting statements, and among them are the following:

The Congress Visiting League Island Navy Yard. "Minnesota" in Rear

> Incidents might be cited where lives would have been seriously jeopardized if the ventilating current had been restored to its normal course, prior to the exploration of the mines, by men wearing breathing apparatus. I have in mind several mines from which live men were rescued only because ventilation was not restored in the part of the mine in which they had remained following an explosion or mine fire. In these cases breathing apparatus was the important factor in their rescue.
>
> DELAY EXPLORATION OF WRECKED PORTIONS OF MINE
>
> Those parts of the mine which indicate the least physical violence should be the first to be explored, since in those quarters there is the greater chance of finding live men. In those parts of the mine where great physical violence is manifest, such as wrecked cars, distorted tracks and broken machinery, the probability of finding life is remote. However, after the outlying districts in which men were known to be at work or districts to which the men may have retreated for safety have been explored, the innermost workings should be examined to ascertain the presence of fire which frequently follows a mine explosion. The discovery and extinction of a fire by the rescuers may prevent a second explosion when the ventilation is restored, especially if the mine liberates explosive gas.
>
> A rescue crew wearing breathing apparatus should consist of a unit of not less than five well-trained men. Each unit when in the advance should be supported by a similar unit acting as a reserve at the base. The presence of a reserve crew has been fully justified in actual rescue operations as being most essential to the safety of the advance crew.
>
> A crew should not proceed into irrespirable gases a distance beyond which it would be able to carry one of its members to fresh air. This distance necessarily is governed by the character of the road over which the crew may travel and the nature of the obstructions passed over.
>
> PRECAUTIONS BEFORE ENTERING MINE
>
> The physical condition of the men composing a rescue crew should be determined by a physician prior to the crew's engaging in rescue exploration work. Only such are in good health and have no organic physiological defects should be permitted to engage in rescue work involving the use of breathing apparatus. During the progress of the work, at the beginning and termination of each shift, the pulse an respiration of each man should be taken and recorded.
>
> The apparatus should be carefully examined and teste by a competent person as well as by each member of th crew and a record kept of each test. Just prior to enterin the mine, the crew should wear the apparatus in the presen of formaldchyde gas to determine if all parts are secu against the admission of external air. Sulphur dioxide is n so well adopted for testing the apparatus since it is absorbed by the caustic potash or caustic soda in the regenerator.
>
> DIFFICULTIES IN USE OF BREATHING APPARATUS
>
> All types of breathing apparatus using compressed oxygen as the source of the breathable air should be so constructed that the entire circulating system may be put unde pressure by the admission of oxygen or compressed air. Th method would admit of determining a leakage under a pressure less than that required to operate the relief valve. water gage placed on the circuit would plainly indicate an loss of pressure due to leakage. The surplus oxygen whi is generally left in the oxygen-supply tanks could well used for making such tests.
>
> The flow of oxygen in two German types of breathing apparatus—the Draeger and Westfalia depends upon the join use of a reducing valve and an injector nozzle, whereas t English type of Fleuss-Proto depends upon the single actio of a reducing valve, the injector nozzle being eliminated.
>
> The above emphasizes the importance of frequent examination of the injector nozzle to insure against its cloggin with caustic potash which may be carried over from the regenerator and deposited in the injector compartment.
>
> HANDLING RESCUE SQUADS
>
> In order that rescue work may continue without cessatio the crews should be organized in parties of five including captain. Two crews should constitute a brigade and thei hours of work and rest should coincide. By the use of eigh crews, constituting four brigades, which will necessitate th services of forty men, the brigades may work in shifts o four hours and rest for six hours and have two hours i which to eat and test the apparatus.
>
> Recent mine-rescue maneuvers, held at Pittsburgh, Penn. and Rock Springs, Wyo., demonstrated that the above pla is practicable and that for continuous duty exceeding 48 hours, the crews should not be required to undergo more than two periods of 4 hours' duration in 24 hr. These periods of 4 hr. should be divided so that each crew will work alternately 1½ hr. at advance and reserve.

The Congress Inspecting the Harbor of Philadelphia, Penn.

Mr. Paul also advocated the use of joint rescue stations because some operators have, in the past, purchased equipment and not provided for its proper upkeep and for the efficient training of the men. George S. Rice then spoke on the urgent need for such training and emphasized the importance of maintaining breathing apparatus in the utmost efficiency while H. M. Wilson spoke of the work of the Bureau in spreading all over the United States those means of safety which had been developed here and abroad and on the creation of a sentiment toward better methods. While a strong presentation of the claims of the Bureau to public recognition and support, it may be safely said that there was not a vord of exaggeration in his claims. He stated that it was he only governmental organization which had been af-orded opportunity of having speakers all over the coun-ry proselytizing for safety and that as the Secretary of Commerce Redfield had recently said no great reform an come in the United States by force of law, however well that law may be backed by active officers. There must come such a change of viewpoint that the law will be practically a dead letter for most of the people. The bulk of the operators must first be induced to see that the law is an expression of a moral necessity before it is forced on the unwilling and negligent.

Following were two papers, one on "The Use of Concrete in Mining Operations" (illustrated), by E. C. Sargent, of Chicago, Ill., and another on "The Coal Resources of Alaska" (illustrated), by Dr. W. R. Crane, of State College, Penn. They are both too diverse and dependent on illustration to suffer any review.

On Wednesday morning the address of Dr. James Douglas, of New York, on "The Public Lands," was read by the secretary, and D. B. Rushmore, of Schenectady, addressed the congress on "The Industrial Corporation and Scientific Research." This latter was regarded as one of the most important presented.

At the afternoon session, George Otis Smith, director of the U. S. Geological Survey, gave a "Plain Talk" on the public lands questions. On the whole Mr. Smith's paper deserves approval but it makes no reference to the high price for which he thinks public lands should be sold or leased, and it does not pay any regard to the extended time during which land is held prior to classification and sale.

The Leasing System for Coal Lands

John F. Shafroth, the senator from Colorado, gave an address in reply. He stated that when he became governor of his state, he endeavored to find what was the cause for the inadequate tax return and he found in one county alone, 9-10ths of the acreage was withdrawn from entry and, as it belonged to the United States, could not be taxed. He did not oppose the placing of high valuations on coal land so much as he did its continued withdrawal from entry or its leasing by the United States government. Such a continuance of the national holding would exempt large areas from taxation and subject the citizens of Colorado to direct federal control in their business.

Why Coal Lands Should Be Sold

The burden of government was greater on the state than on the nation as the state had to employ more officials per thousand inhabitants than had the Federal government and the expenses could not be met if only a part of the state domain were subject to taxation, the cost of administration being dependant more on the density of population than on the actual numbers The interposition of vacant government land made administration extremely difficult. The $15,000,000 paid by Colorado in federal taxation brought her but little, seeing that the army and navy were of little avail to a people snugly placed in the heart of a continent, nor had Colorado much interest in harbors and rivers. She *was* interested however, in 50,000,000 acres of forest land, within her borders, which were idle and not open to entry; 40 per cent. of it was above timber line, 30 per cent. had only scrub timber, and the 30 per cent that remained would, according to the U. S. Agricultural Department, only grow a tree 19-in. in diameter in 200 years. She was interested in 9,425,000 acres of coal land in Colorado, which could not now be purchased at any price and might later be offered for $400 per acre, yet, if figured with all the land purchases of the federal government, it cost the United States only 4.7c. per acre.

Who Receives the Money for Coal Land

A delegate from the Land Office declared that this money paid in to the department was delivered to the reclamation service to be used in the irrigation of the Western arid lands, but Shafroth replied that eventually it was returned to the government by the farmers thus benefited so that it constituted only a loan and not a *return* of the capital to the settlers who had built up the West.

Several took part in the discussion and it was interesting to note that there was no attempt among Westerners to defend "dummy entries." The West, as one said does not wish to renew the past. While dummy entries are and were necessary to gather together a sufficient acreage for operation, it is better to change the law than to attempt its violation.

Thos. J. Walsh, senator from Montana and chairman of the Senate Committee on Mines and Mining, was willing to approve of a leasing system for oil and gas but not for coal and other minerals.

At the evening session, Dr. Chas. R. Van Hise, president of Wisconsin University, Madison, Wis., read his address on "The Relation of Big Business to Industrial Prosperity with Special Reference to Mining," in which he showed the fatuousness of a return to the small plants and small aggregations of capital of former years and doubted whether it would prove true that combinations of the largest size were too unwieldy for efficiency.

The morning session of Oct. 23 opened with the report of the Committee on Nominations which named 4 directors to serve 3 years or until their successors were elected. These were E. A. Montgomery, Los Angeles, Calif.; Hennen Jennings, Washington, D. C.; W. F. Richards, Pottsville, Penn.; and M. S. Kemmerer, New York, N. Y.

Chas. E. Van Barneveld, of San Francisco, Calif., then read an address on "The Mineral Division of the Pana ma-Pacific Exposition," inviting mineral displays on that occasion and asking that the American Mining Congress meet at San Francisco in 1915, during the life of the exposition. S. A. Taylor then proposed that as the work of the congress was constantly growing and as there was a continual deficit in the treasury, a Ways and Means Committee be formed to draft a scheme for making expenditures and receipts balance.

The Ills of the Coal Industry

Dr. E. W. Parker then read an address on "The Cost of Coal Production" and a substitute for John W. Boileau, of Pittsburgh, Penn., delivered his remarks on "What is the Matter with the Coal Mining Industry." Apparently he thought the main trouble was the abstention of the industry from the meetings of congress. As he was not present perhaps his opinion may be discounted; certainly his example should not be followed.

The discussion was lead by A. J. Moorshead. He regarded debate as of no value so long as the people of one state were rejoicing in the laxity of their own mining laws and chortling over the severity of those in neighboring states. Mr. Moorshead declared that the workmen 's compensation law and the requirement that fire-proof structures be erected near, within and around the shaft below ground met with due approval in Indiana. They were, the Indiana operators thought, good measures so long as Illinois alone confronted them. Moreover, the wage difficulty made coöperation across state lines impossible.

A Possible Self Cure

However, despite Mr. Moorshead's prognostications, gloomy, though cheerfully expressed, it would seem that when all the fields are opened up and territory adjusted, the question of meeting competition will be less fierce and ultimately the disturbing forces will be those very states, whose territory has been curtailed by adverse legislation and labor activity. When the less afflicted states move up slowly into line, their territory holding will be slowly and surely reduced, as they meet the increasing demand of the labor unions and the state.

It appears that in a few years, war will almost cease because to a large extent, as there will be no new fields to open up in the East, the lines of every field will be more firmly fixed and the mines established will be satisfied with the area within these lines. When new counties and states are being opened the balance of power is often rudely disturbed.

It is, however, to be hoped that state's rights will never be pressed to such an extent that unequal safety will result. The right to keep unsafe mines in order to maintain a market gained by such methods is not a right for which honest men will strive and it is time that the laws of all the states be made to give at least equal security, even if it is not necessary to impose equal burdens on all.

Coal Operators and Metal Men Part

For the afternoon session the meeting split, the coal operators assembling in another room and discussing the general business situation. Carl Sholz, of Chicago, Ill., occupied the chair. From all reports there was not so much harmony as good fellowship.

In the ballroom, W. H. Fluker, of Thomson, Ga., read an address on gold mining in that state. Dr. Martin M. Foster, chairman of the House Committee on Mines and Mining, read an article on 'The Federal Government and the Mining Industry." Prof. C. J. Norwood called attention to the need for federal aid of mining schools, comparable to the assistance now given to farming institutions. He said that the strength of the Kentucky coals to resist compression had not been determined and that when recommending as chief inspector an increase in size of ribs, he was unable to determine what that increase should be owing to lack of funds for the necessary experiments.

"The Radium Situation," by C. W. Parsons, of the Bureau of Mines, was extremely interesting, that organization being about to prepare radium for use in American hospitals. Most of the radium ores are found here. but only about one gram of the metal is to be found in America in its available form and all of that was extracted abroad.

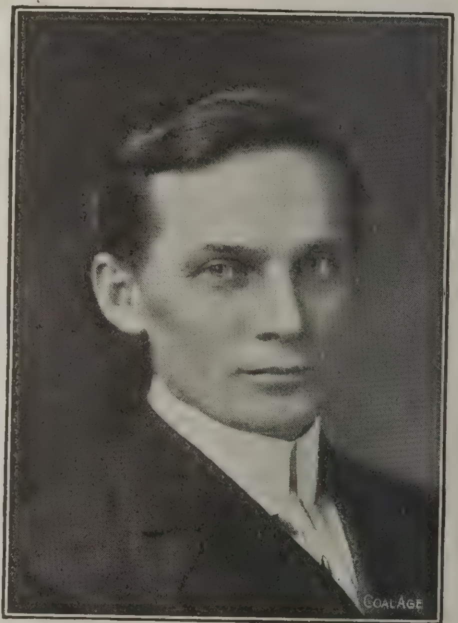
In the evening a smoker and vaudeville which was largely attended was held in the ballroom of the hotel.

Friday was the closing day of the meeting and in the morning session, Geo. R. Wood reported for the Committee on Standardization of Electric Equipment i Mines.

Compulsory Arbitration and Collective Bargainin

Wm. B. Wilson, Secretary of the Department of Labo then delivered an excellent address on "Arbitration a a Factor in the Mining Industry," in which he oppose compulsory arbitration, but said that there were mora business and political reasons for collective bargainin Without it, the working man was crowded to the wal without it business men did not know at any time wha labor disturbances might confront them, what reductio in wage scale might occur to aid a competitor, what i crease of wage rates might make it impossible to pr duce coal at contract rates.

He believed that when the working man was force by law into compulsory arbitration, he would be at disadvantage for while the operator had a well-defin boundary line between profitable operation and economi loss, the worker had a flexible line of resistance. H could reduce or decrease his living charges. Thus th arbitrator tended to keep in mind the defined boundary line of prices and to put the burden on the workingman. who by surrendering his standard of living, could continue to subsist.



Carl Scholz

Newly elected president of the American Mining Congress.

C. E. Maurer tried to discover on what basis Mr. Wilson figured a division between the "partners in industry" —capital and labor. Finally Mr. Wilson declared it was an "American living wage" but he admitted that the expression was extremely elastic and meant one thing in Illinois and another in West Virginia.

Should the Miner Be Held to his Bargain?

Mr. Wilson declared that it was not right to hold the miner rigidly to his bargain and to compel him by law to work at the scale he had signed because the operator could not be bound to keep his pledge, for he could not be compelled to operate at a loss or to run his mines when no coal was needed. Both parties, in his opinion, roke their bargains to some extent by suspending operaion, and usually without moral stigma. The contract ould only be interpreted to mean that when A and B chose o work in partnership, the terms should be as A and B ad laid them down. Any attempt to make the unions esponsible by forced incorporation, he regarded as ill dvised. W. L. Connell, of Scranton, said that the anhracite miner could move to the bituminous region if e did not like the contract but the operator of an anhracite mine could not thus move from place to place. Mr. Connell condemned the continued restriction in output which was, in the anthracite region, a fixed policy of the Union.

The Resolutions of the Congress

At the afternoon session several resolutions were introduced by S. A. Taylor on behalf of the committee appointed for that purpose. Sidney Norman's resolution placed the congress on record as favoring laws to give protection to minority stockholders by making directors more definitely responsible for their welfare and constituting infraction of laws to that end as a felony punishable by imprisonment. The resolution calls attention to recent Stock Exchange scandals in New York.

J. F. Callbreath
Secretary of American Mining Congress.

D. W. Brunton's resolution called for an attempt on the part of the mineral land-law revision committee of the congress to enlist the support of the American Institute of Mining Engineers and the Mining and Metallurgical Society. Another resolution introduced by D. W. Brunton urges upon President and Congress the enactment of legislation providing for a Department of Mines and Mining with a member of the President's cabinet at its head.

S. A. Taylor himself fathered the resolution that the Director of the Geological Survey and the Director of the Bureau of Mines be requested to coöperate with the heads of the departments of mines or the proper officers in the various states, together with a committee of the American Mining Congress in order to secure uniformity as to form and time of making mining statistical reports.

H. N. Lawrie's resolution urged immediate passage by Congress of legislation, providing for federal assistance to state mining schools. C. E. Maurer, of Ohio, declared in his resolution that as there were many systems of evaluating properties and as a tendency had been shown to put an undue load of taxation on the mining industry and as this burden was far from uniform, hence a special committee of the congress should be appointed to investigate and recommend a fair, uniform and equitable basis of valuation for taxation.

William Maloney presented a resolution, desiring that the federal government speedily enact laws granting redress to Alaska, so that private capital may be induced to interest itself in the development of the great natural resources. John E. Patton, of Tennessee, desired that the U. S. Internal Revenue collectors have instructions issued to them by the treasury, so that the Corporation Income Tax Law may be made uniform in its enforcement and may provide that a definite royalty or depletion charge be allowed as an item of the cost of production in arriving at the net income of mining companies for purposes of taxation. R. Dawson Hall introduced the following:

> Resolved: That we express our sympathy with the relatives and friends of those who have lost their lives in the terrible explosion at the Dawson mine and that we join with the officials and owners of the Stag Cañon Coal Co., in regretting that all their efforts and forethought have, in some unfortunate and inexplicable manner, been rendered of no avail and that the secretary communicate the matter of this resolution to the proper persons.

C. E. Maurer's resolution was passed urging upon the Congress of the United States and the State legislatures, the necessity of a modification of the so-called "Anti-Trust" laws as applied to our natural resources in order that they may be conserved and proper safeguards thrown around the employees and further providing that the address of E. W. Parker be sent to the President and Federal Congress and the governors of the coal-producing states. All the resolutions here discussed were unanimously approved.

In the afternoon an address on "Workmen's Compansation Laws and Accident Prevention Work," was read by David Ross, of Springfield, Ill. Lack of time caused S. A. Taylor to ask privilege to print his paper without reading it. In the absence of Dr. J. A. Holmes, director of the Bureau of Mines, Geo. S. Rice, read his "Lessons of the Year in the Mining Industry." In brief it deplores the "tardy and inadequate recognition and aid from the legislature and administrative branches of the general government" and stated that the bureau had been criticised for "failure to do numerous things of which there was serious need." "It is unfortunate, however, that our inability to do many of these things at the opportune time tends to discredit all our work and even the movement for greater safety among the miners, who appreciate less fully the cost of such investigations and whose goodwill, confidence, and coöperation are essential to the success of all our efforts."

Carl Scholz, who was elected president, occupied the chair throughout the afternoon session. The resolutions introduced by J. R. Burton, of New York, providing for the investigation of scandals by a committee of the congress and for the expulsion of members of the body who employed men who had been convicted of fraudulent mineral land selling, were tabled after no little discussion and debate.

The first resolution would have involved the Congress in bankruptcy and the second meant the establishment of a blacklist and was of doubtful legality.

The officers for the ensuing year are: Carl Scholz, president; Hennen Jennings, Washington, D. C., first vice-president; M. S. Kemmerer, New York, second vice-president; Harry L. Day, Idaho, third vice-president; with the following directors, D. B. Brunton, Colorado; D. H. Dern, Utah; W. G. Conrad, Montana; S. A. Taylor, Pennsylvania; John Mayer, Missouri; H. N. Taylor, Illinois; E. A. Montgomery, California; W. J. Richards, Pennsylvania and Dr. James Douglas, New York.

In the basement of the Horticultural Building, a "coal mine" had been prepared by the Bureau of Mines which gave the public a good idea of underground conditions. Rescue and first-aid demonstrations were made by the Lehigh Valley Coal Co., on Oct. 20; by the Susquehanna Coal Co., on Oct. 21; by the Lehigh Valley Coal Co., on Oct. 22; by the Lehigh & Wilkes-Barre Coal Co., in the evening of the same day, and in the afternoon of Oct. 23; by the Lehigh Coal & Navigation Co., on the evening of Oct. 23, and in the afternoon of Oct. 24. The Philadelphia & Reading Coal & Iron Co., demonstrated on the evening of Oct. 24, and both morning and evening of Oct. 25.

In the lecture hall lectures were given by J. R. Fleming, demonstrations of rescue apparatus and first-aid work by W. L. German and O. I. Young. Motion pictures were exhibited by J. R. Fleming six times every day. The features were supplied by the Bureau of Mines.

⁂ ⁂

Explosion at Stag Canon Fuel Co.'s Mine

SYNOPSIS—At the Dawson Mines of the Stag Cañon Fuel Co., in Colfax County, New Mexico, a severe explosion probably killed 261 men. All but 80 of these have been brought out. In all, 27 men were rescued. The explosion occurred at 3 p.m. on Oct. 22. The shooting in the mine was effected by electricity, no shots being fired till all the men were out of the mine.

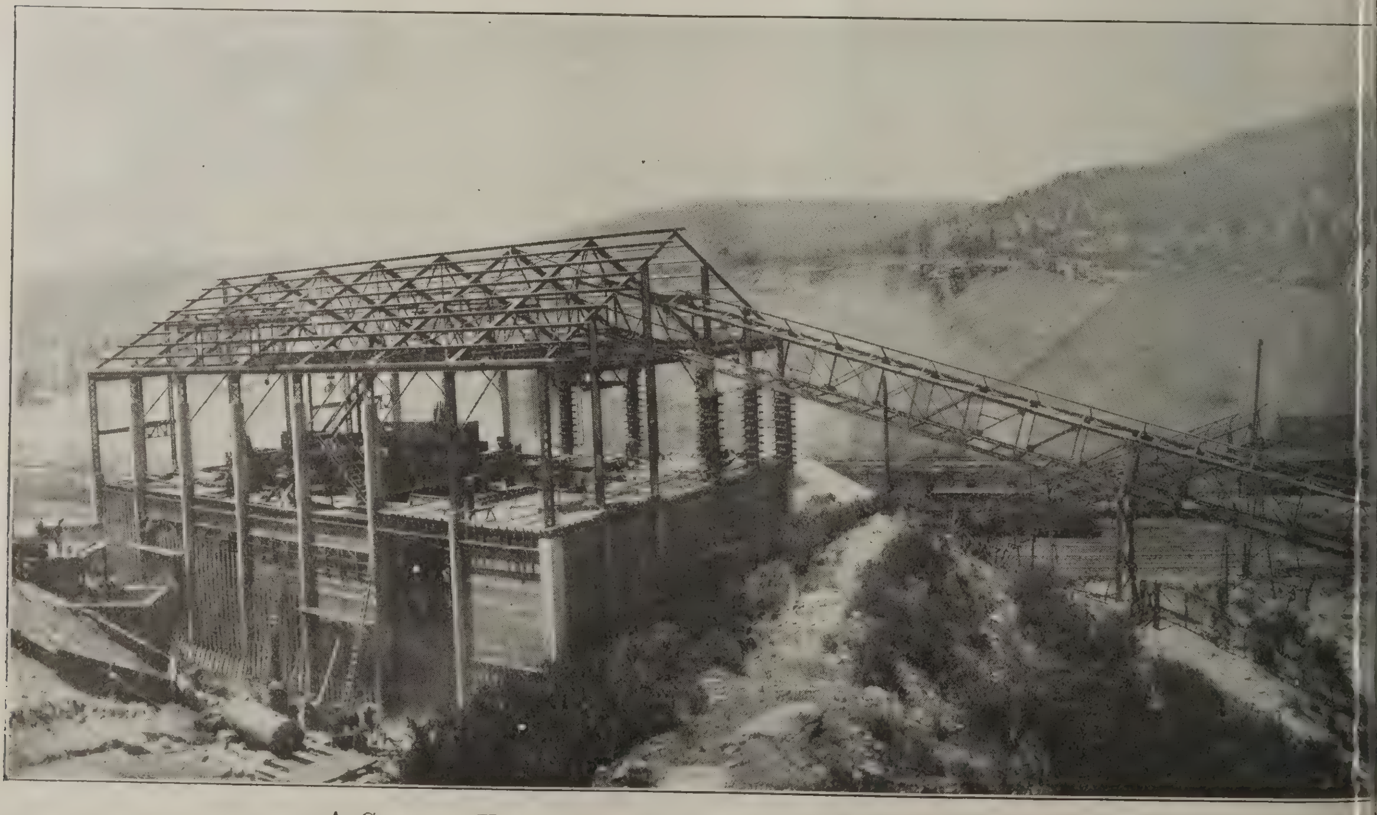
⁂

The mines of the Stag Cañon Fuel Co. are opened in Colfax County, near the northern or Colorado line of New Mexico, and, consequently, are not far from the well known workings of Trinidad and Walsenburg in Las Animas County, Colorado. The plant is located at Dawson on the Vermejo River and its branches, that watershed being an important tributary of the Red or Canadian River.

The coal mined is part of the southern end of the Raton coal field and is of the Laramie series of the Cretaceous system, these measures having a thickness of about 800 ft. in the vicinity of Dawson. According to Jo. E. Sheridan,* formerly the territorial inspector, the coal makes an excellent coke, and there are several sheets and sills of igneous rock intruded into the measures, these thickening in cases into masses like laccoliths and

---

*Much use is made in this report of Mr. Sheridan's address before the American Institute of Mining Engineers, in February, 1909.—Ed.



A General View of the Washery and Tipples of the Stag Canon Fuel Co.'s M

Sometimes producing small areas of natural coke. Yet, there are few dikes throughout the entire southern portion of the field and little or no faulting occurs where hese appear.

Only one seam of coal is worked, the Raton or Blossbourg, and it varies from 6 to 8 and in places reaches 11 t. The other seams are of much less value. The holdings of the company aggregate 56,218 acres, and of this 38,500 are coal lands. The mines have been working for 18 years, but they were only purchased by the Stag Cañon Fuel Co. in 1905; at that time they belonged to the El Paso & Northeastern Company.

Several Escapeways

The Vermejo River and its tributaries cut heavily into the seam, and as the coal bed is comparatively level it can be attacked anywhere along a crop 40 miles in length. Consequently, it was hoped, that with so many opportunities for escape after the recent explosion, several men might be saved. The bulk of the workings are to be found in Rail Cañon, where are the washer, power plant and coke ovens. In this cañon are four important openings, but Nos. 2 and 3 do not constitute entirely separate mines but are connected by many headings. On the Vermejo River bank, not far from Lorita, two openings, Nos. 5 and 6, have been made. The former alone is working and forms an escapeway for mines 2 and 3.

The coal is hauled by mules from the rooms to partings within the mine, whence it is brought to the outside yards by Jeffrey, Westinghouse and Goodman motors. On the outside, coal is hauled from mines 1 and 2 to a common tipple over a tramway 6600 ft. long by two 28-ton Porter, one 20-ton Vulcan, one 18-ton Lima, and two 6-ton Porter steam locomotives.

The mines have been sprinkled by water cars and the dust has been removed from the roadways as far as is practicable. A complete telephone system having stations at the most convenient points within the mine, was installed to afford communication with the outside.

The shooting was done after all the men were out of the mines. Every man hung up his check as he went into the mine, and took it on leaving. If he failed to take his check, the mine was searched for him. The usual precautions were taken in throwing switches and a red light was displayed at the mouth of the mine to warn men from entering before the firing switch was thrown.

The air delivered to the mine was in 1909, 260,558 cu.ft. per min. Allowing 600 cu.ft. for each of the 59 mules this left an allowance of 306 cu.ft. for each man employed. The water gage at No. 4 mine was 0.8 in. and at No. 2, 1.2 in.

Information So Far Received

Despite all the care manifested by the company, at 3 p.m. on Oct. 22, there was a disastrous explosion in No. 2 mine, in which 261 men were probably killed, 27 being rescued. Heavy falls of roof near the entrance blocked the way to the rescuers. The fan was put out of commission, but was repaired and made available for the rescue work. The mine covered so large an area, 437 acres in Rail Cañon having been extracted before 1909, mostly from the mines where the explosion occurred, that it was for a long while hoped that many of the men might have wandered into remote sections of the mine and escaped. It is now feared that there is no such possibility. Apparently, Superintendent William McDermott and Henry P. McShane, of New York, and 16 miners and sub-bosses were about to escape when a fall of roof killed and covered them with débris.

It is reported that two of the helmet men were killed at their work.

Dawson, N. M., during Construction. No. 2 Mine Lies Further Up the Valley

EDITORIAL

Getting a Congress under Way

The American Mining Congress tried to devote one whole day to formalities and suffered the natural consequences of the attempt. An address of welcome from the city was to be followed by one from the state; the president of the congress was to respond and then three-minute replies were to be made by the delegates from 33 states. In the evening the president was to make his annual address and there was to be a reception to the officers and delegates by the citizens of Philadelphia.

Such an elaborate program of mutual gratulation does not attract anyone. The delegates and members agree to wait till, as they express it, "the convention settles down to business." They are somewhat inclined to put on the average presidential address, the unfavorable criticism of Dr. D. W. Brunton: If the outgoing president comments on the year's successes, he is thought to be guilty of self-laudation; if, on the other hand, he lays down the necessities of the hour, he is subjected to the accusation that he is trying to control by officious advice the conduct of an office which he is about to vacate.

So this function is rarely enthralling unless it is made, as we believe is true in England, rather an address from the president than a presidential address, the speaker forgetting his office and striving merely to deliver an utterance which will have an interest in itself regardless of its relation to any past or future action of the body to which he has been appointed president. He is thus often enabled to probe deeper into some subject than any earlier investigators and does not endeavor to cover all the objects of the society with a series of inadequate generalities.

Even though the address be as excellent as that of Doctor Brunton, it fails because the mind cannot be led to consider several problems at once and because all traditions are against the laying of stress on such official utterances.

Because of a knowledge that opening sessions are rarely important, the attendance of Tuesday was scanty and the citizens of Philadelphia, who, be it said, desire to correct the Universe without intimate knowledge of its affairs, were not encouraged by the scanty enthusiasm of the members and delegates. The interest of the press and of its readers flagged, whereas had Shafroth, Wilson, Parker or Moorshead spoken at the opening session, there might have been a keener interest shown.

It is to be hoped that in coming sessions the "pink tea" features will be wholly subordinated to business, that the 33 delegates-in-chief will not be called to give 99 minutes of oratory. It is still more to be desired that the meeting will be held where more coöperation is extended. The action of Philadelphia was not one to establish its reputation as a convention city. Its uncertain policy in reference to the mining show, the ruling of its papers that they would not mention the event till it was already in progress, and its almost studied indifference to what was transpiring, convince us that not for a long time will the management of the congress agai exhibit on its badge and program a picture of a mine hand-in-hand with William Penn.

Eventually the congress got under way, with a larg number of distinguished persons present and many paper of unusual value. It was not successful, however, in impressing on the public the broad sense of responsibilit to the nation existing in the coal industry and its desi to coöperate with the public in the promotion of all th national needs. This publicity must be obtained an the public learn that its most abused servant is the on which has served it most faithfully and received th meanest reward and the most carefully studied misrepresentation and abuse. The papers of the congress and it resolutions should appear in brief in the journals of al the cities of the Union, for mining is the second larges interest in this nation.

⁂

Colorado Coal Strike Situation

Before the recent strike in Colorado was called, th United Mine Workers of America claimed a membershi in that organization, in the States of Colarado, Utah an New Mexico, of only 2048, out of a total of 23,000 me employed. Approximately 1000 of these members wer enrolled from the northern part of Colorado, where strike had been in progress for many months.

Some weeks ago an official of the Mine Workers' organization went to Colorado and announced that it wa his purpose to bring about the recognition of his union b the owners of all coal mines. The operators refused t sign a contract which would require them to employ onl union men in their mines.

The union official above mentioned then announce that he would refer the matter to a convention of miner of all the camps of the state. A meeting was held i Trinidad and 250 men were present. Of this numbe 100 men were striking miners from northern Colorado about 45 of the delegates were officers or paid employee of the union. The rest of the men present were selecte by those in charge of the convention, and in no sense actually represented the men at work in the collieries. Th convention voted to call a strike for Sept. 23, and on tha day approximately 50 per cent. of the men engaged i about the coal mines laid down their tools.

The demands of the miners include a 10 per cent. advance in wages, a semi-monthly payday, an eight-hou work-day, a check weighman and better working conditions.

There has never been a better example of how easil one or two men can upset a great industry and brin business over a large territory to a condition borderin on chaos and revolution. People who think that such result can only be brought about when the conditions o labor in the affected industry are unsatisfactory and unfair will be obliged to revise their opinion, providing they will take time to make a careful investigation. Ther is, of course, a restless element in labor circles that i ver satisfied and always ready for a change, or any nd of an adventure, that will bring with it temporary eedom from real work. However, there are not enough ch people to bring about a condition similar to the one w existing in Colorado. Something more must be sup-ied, and this is furnished in the form of intimidation id personal violence.

Conditions in Colorado are a replica of what occurred West Virginia some months ago. Since the inaug-ation of the strike, a number of men have been killed id considerable property has been destroyed; mine ildings are being fired upon; passenger trains carry-g mail have been stopped and searched by the strikers; cupants of stages have been dragged therefrom, kid-apped and taken to strike headquarters, and the lives all men who are desirous of working in the mines are reatened daily.

Labor conditions in this country have now reached a ass where one or more professional agitators can walk to a district or state where they are unknown and un-amiliar with actual conditions and succeed in the dis-uption of all business in the industry they attack. This a form of licensed violence that must be dealt with if e, as a nation, are to maintain our industrial supremacy mong the governments of the world.

We are earnest in our desire that labor conditions rougout the coal industry shall be satisfactory. We ant to see the men who work amid the dangers of our ines the best paid employees in the land. We never ave, and never expect to uphold, any coal company or ny individual officer that is unfair and selfish in the reatment of his employees. However, we seriously ad-ocate the enactment of such measures as will provide a ess destructive method of settling disputes between em-loyers and employees. A partial solution of the prob-em is "publicity." Newspapers, as a general rule, are ike politicians, somewhat shy on supporting the minor-ty, even though the "few" have right on their ide. There remains, however, one way in which pub-icity may be gained, and that is through advertising. t is surprising today that so few great corporations which need to place their cause before the people at large vail themselves of the advertising pages of the papers n their particular field.

⁂

The Western Coal Lands

Of all the interesting features of the American Mining Congress, the debate between J. F. Shafroth, senator rom Colorado and G. O. Smith, director of the U. S. Geological Survey, takes leading place. Mr. Smith has ndirectly the selling of the patrimony of a nation and as managed after a long delay, to dispose of a solitary quare mile. Yet this one insignificant sale, he regards s a justification of the prices he has set on all the coal ands he is marketing.

If the followers of Henry George ever start to make Uncle Sam pay taxes, we shall soon see whether he will ind it possible to hold Western coal lands at $400 an cre. Land holding at outrageous prices has always been ound unprofitable where taxes had to be paid and this ation would find itself in the hands of the sheriff, if it ad to pay taxes on the coal lands of the West, if these were assessed at the extremely liberal valuation of the irector of the Geological Survey.

We are not surprised that the Western states which have to maintain their schools, their roads, their police and their courts, condemn the bureaucracy which holds so large a proportion of their lands inactive and yet refuses to pay taxes on them. Perhaps it would be right, certainly it would accord with our precedents, to let lands in the hands of the government go untaxed till they can be sold, if provision for their sale were immediately made and if the price was perfectly sane. But millions of acres are withheld from entry and other millions are evaluated at a higher price than is now paid in most of the best known coal fields of the United States.

We think it may be safely said that in only one state in the Union is coal land ever sold at $400 per acre. Anthracite and the Pittsburgh coking coals of Pennsylvania are sold, it is true, at higher prices, and some West Virginia coal, if it were offered for sale, would command almost that figure, but the bulk of the coal land even in those long developed states is nowhere so highly appraised. The majority of the fuel in the Appalachian states can be bought from $5 to $100 per acre.

We are giving the West special legislation of a most onerous and unfair character. Lands which if sold by individuals would barely bring $5 or $10 per acre to the vendors, are held for $400. Let us compare the situation in the Rocky Mountain section with the conditions in Ireland, a land where the desire for the control of its own affairs is even more rampant. By the enactment of special and unusual legislation, the imperial parliament has made every effort to secure land for the inhabitants at reasonable prices and to enable them to buy what land they need. And furthermore, that parliament is already expending on Ireland within the confines of its four seas, far more than the island contributes. In fact it is likely that the dominant kingdoms of England and Scotland will pay $10,000,000 a year to Ireland and receive not one penny for national defense or administration.

In contrast we take from Colorado $15,000,000 per annum for national purposes and are holding up its resources and those of other Western states at such a high figure that their development is throttled. At present they are talking home rule or states' rights in a mild way. They are aiding in the support of our national institutions, though most of these do not add in any material way to their happiness or security. Our army and navy afford little protection and our rivers and harbors bring little wealth to Colorado compared with that they assure the other states. Yet the Western people now pay and are willing to pay *pro rata* taxes with states more vitally interested in these institutions.

Let us be careful lest the Western states, whose interests are forgotten, become so angered at our unfair treatment that when they get justice, perhaps even more than justice, they will not be appeased. Indeed, let us make all haste to do our duty now for the concessions now rightly demanded by Alaska and the West will ultimately be granted, and the theories of Pinchot, Smith and the newspapers will fade away like an evil dream. For are we not all one people and are not the men of the West as well entitled to justice and as much our national concern as the inhabitants of Indiana, Ohio and Illinois? Is it expedient that we should demand of our citizens in the West a manner of sale radically different from that which has been our practice for a century?

SOCIOLOGICAL DEPARTMENT

Simplified Breathing Apparatus at Witkowitzer Mine

By Josef Popper*

SYNOPSIS—Details regarding a new breathing apparatus, the helmet of which is made tight to the face of the wearer by a sponge-rubber gasket. The potash cylinder has devices whereby all the alkali is made available for the absorption of carbon dioxide and the cooler is kept at a low temperature by the use of asbestos steeped in alcohol. The apparatus can be kept in continuous service from 3 to 3½ hr. and weighs 26 to 29 pounds.

⁂

Previous improvements in breathing apparatus have not been based on any new fundamental principles. They have, however, tended to increase the weight with which the rescueman is burdened. In the laboratory of the Witkowitzer collieries in Maehrish-Ostrau, Austria, experiments have been made with a view to simplification of the commonest types of rescue apparatus. The objects have chiefly been to reduce the weight for equal time capacity and to cool the inhaled air to a lower temperature so as to reduce fatigue. The total weight of the apparatus has been kept down to about 27 or 28 lb., yet the designers have been able to use a larger steel cylinder and a new type of potash cartridge, which together make possible the use of the helmet for a longer period than has been hitherto possible.

A Rubber Sponge Instead of an Air Tube as Face Gasket

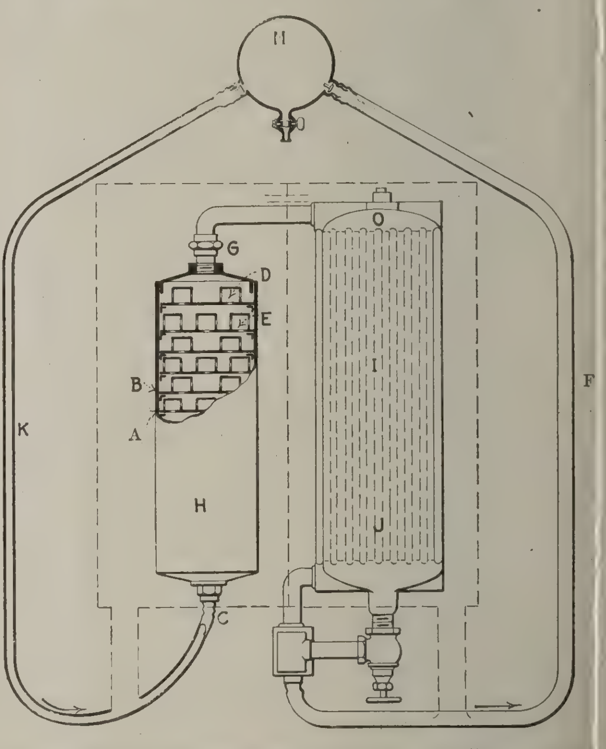
An improvement has also been made in packing the helmet so as to avoid the danger inherent in those packed with a rubber tube, should this tube become damaged. This pneumatic ring has been replaced by a rubber sponge, over the outside of which is drawn a sheet of rubber. But the side of this gasket which is in contact with the face is not so protected, and is left in a spongy condition. In hot mines it can be cooled by moistening. The sponge is pressed down by two bands. The helmet carries a window glass and a movable wiper.

The apparatus is carried on the back. The oxygen flask *O* weighs 11 lb. It holds 13.77 cu.ft. of oxygen at a pressure of 150 atmospheres. The pressure can be read by the man wearing the helmet from a manometer placed on a spiral tube. The reducing valve is so adjusted as to feed about 0.07 cu.ft. of oxygen per minute.

The fresh and the regenerated exhaust pass through the connecting tube *F* into a breathing bag of large size and thence to the mask *M*. The cartridge is fastened in place by a simple device, it being held and made gastight by the adjustable threaded tube *G*. The cartridge is of a new type patented by Nowicki, chief chemist of the collieries.

The Air Regenerator

The chemicals for purifying the exhaled air are held as usual in sheet-metal shelves with central or side openings, and by wire netting. Between the several shelves the air sweeps over the chemicals. To place these under the wire netting and simply pass air over them is an inefficient practice, for the chemicals are not completely utilized and take up gases only on their surface. This leads to the use of more alkali than is necessary, and thus adds to the weight of the cartridge.



A Breathing Apparatus Now Being Subjected to Experiment

In the new potash cylinders the chemicals are still used in granular form. The grains of caustic potash are placed on the shelves *A* and *B*, which have a series of holes covered with the little perforated spacing caps *D*. The holes *E* in one shelf are staggered with respect to those in the next. The side walls of the spacing caps let the gases pass easily through. The gas to be treated by the chemicals enters from below through the tube coupling *C* and passes up through a large number of holes *E* and through the spacing caps, which are fastened on the lower shelves. Hence it reaches the chemical between the spacing caps. In contrast with the common type of cartridge the air does not pass by or over the chemicals, but owing to the cap device is compelled to penetrate to the interior of the chemical layer.

Shreds of filter paper are mixed with the chemicals to take up such potash as is dissolved by the moisture in the expired air. Experiments show that after two hours the regenerated air contains no carbon dioxide, after three hours 0.2 per cent. of its volume and after four hours ly 0.6 per cent. In the experiments, cartridges of 2.2 4.4 lb. weight have been employed. The exhaled air sses into the cartridge *A*, where its carbon dioxide is moved. Thence it flows through a tubular cooler *I*, hich, to increase its cooling effect, is provided on the wer part with asbestos *J* which, previous to using the pparatus, has been saturated with a volatile liquid (al- hol). From the cooler the air passes to the injector d then to the helmet.

---

*Engineer, chief mining inspector of the Witkowitzer collieries in Maehrish-Ostrau, Austria.

Note—From a paper before the International Congress of Rescue Work and Accident Prevention, Vienna, 1913. Translated expressly for "Coal Age" by E. F. Buffet, from the "Montanistische Rundschau."

From the helmet the exhaled air is first conducted by e action of the injector through a breathing tube *K*, to the exhalation half of a double bag. This half is nnected with the inhalation section by a little tube.† oth the inhalation and the exhalation halves are made in e, and divided in two parts by a separating wall. One art is placed under the steel flask, the other under the rtridge. The weight of the apparatus is between 26 and 9 lb. for a duration of three to three and a half hours.

The experiments have not been completed, but they in- icate that a distinct advance has been made in breath- g apparatus.

Welfare Work at Roslyn, Wash.

By Ralph W. Meyer*

Roslyn's new $10,000 Y. M. C. A. building was formal- y opened to the public on Oct. 7, the anniversary of the estruction of the old structure by fire. The Northwest- rn Improvement Co. contributed $4000 on condition that n equal amount be raised by the miners and citizens of he town. Over 700 persons responded and oversubscribed he amount, and the result was the construction of the nly Y. M. C. A. to be found in a mining camp in the orthwest. The company not only contributes the sum tated but also gives the site for the building, provides ree lights and coal, supplies steam for the baths without harge and pays the secretary's salary. Taking the old nstitution as a criterion, the building forms the best nvestment the company has in the town.

Y. M. C. A. Hall Erected by the Northwestern Improvement Co. and Its Employees

Description in Detail

The basement contains the heating plant, a large swim- ning pool, shower baths, clothes lockers and a drying oom. In this respect it is unique, being the only Y. M. . A. west of the Rockies which has a miners' bath and hange room. This department is well patronized by the niners.

A bowling alley is partitioned off from the swimming and bathing part of the lower floor. The main floor contains a large auditorium with a gallery around it and a stage at the end. It has capacity to seat about 700 persons, and Chautauqua lectures and other entertainments will be held in it. The chairs can be folded and moved out of the way when it is desired to use the place for a gymnasium or for basketball games. The main floor contains a large room for the circulating library, a reading room, a billiard and pool room, a ladies' rest room, and a large room for the secretary's office.

Other large mining companies in the Northwest are watching it with interest. If it is an undoubted success, they expect to start organizations of a similar nature in their villages. During the winter season, a teacher gives instruction in English to a large class of foreign-born miners, in one of the small rooms of the building.

Mine Rescue Maneuvers

The Bureau of Mines from its experience of the turmoil of impromptu rescue work, its uncertain discipline and later vain regrets, has decided that success in actual mine recovery can only come by duplicating the difficulties and conditions, commonly to be faced, at maneuvers carried out in an actual mine.

To this end a few days before the American Mine Safety meeting about 20 members of the Bureau of Mines, camped at Oak Station, near Pittsburgh, Penn., on the Charleroi branch of the Pittsburgh Railways Co., for 10 to 12 days for practice in rescue work. As soldiers and sailors should not wait for actual war, so rescue corps should have actual practice in the conduct of rescue work apart from mere helmet-wearing exercises.

Training in musketry should be supplemented by maneuvers if soldiers are to be prepared for war, and realizing the force of the analogy, the Bureau of Mines is endeavoring to develop the study of mine-rescue work apart from mere helmet practice.

The study of recovery of mines after mine explosions and fires, started by W. E. Garforth and extended by the American Mine Safety Association, is now to be made more vital by actual mine-rescue "field work" in real mine workings.

It is a poor time for planning when the thought of others dying makes concentration of mind difficult or impossible, when the peculiar immediate problems relating to the mine complicate matters and when danger threatens on every side. If the general principles have been thought out at a time when there is no mental or moral stress, the mind can meet these problems of the minute without confusion.

The difficulty of conjuring up conditions without enacting them resembles that of designing a machine without a sketch on paper. A few general ideas may be evolved by mere thought, but a mass of thronging details are made manifest by practice. Paper will refuse nothing but the test of field maneuvers can never be so deceptive.

For a purpose of this kind a small experimental mine is relatively of little value. What is needed are workings large enough to duplicate conditions likely to be met in actual rescue practice. The burden of carrying the apparatus long distances will prepare the crews for the severities of real mine recovery.

DISCUSSION BY READERS

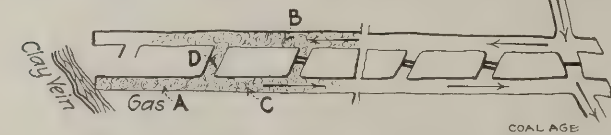
Collapsible Stoppings

Letter No. 7—Before discussing the question of the possible efficacy of "collapsible stoppings" in mines, it will be well to understand two points bearing on the subject. 1. What constitutes a collapsible stopping? 2. What features of an explosion will such a stopping affect?

A collapsible stopping may be understood to be one constructed to withstand the ordinary concussions incident to mining coal, but not permanent under the excessive stress of even a comparatively slight explosion of gas or dust. Such a stopping may be constructed (a) to conduct the ventilating current with a comparatively slight loss of air, to the working face or head of the entry; or (b) it may be built in such a manner as to allow a large percentage of loss where the working requirements will permit of such loss.

The stopping first mentioned, being comparatively tight and allowing but a small loss of air, will naturally make the void spaces in the breakthroughs reservoirs for the deposition of much dust, which will be drawn into these places and settle because of the reduced velocity of the air sifting through the stopping. The second stopping mentioned, having larger openings and permitting a greater loss of air, will not accumulate as much dust as the former. When we consider that coal dust is an important element in the propagation of an explosion, if not the chief element concerned, the danger presented in the use of either of these stoppings, as accumulating quantities of dust and distributing the same in the airways in the event of any concussion of the air, is clearly apparent.

The principal feature of an explosion that the collapsible stopping is expected to affect is the rapid expansion of the products of combustion. There are two incidental characteristics, besides, that should be considered; namely, the unburned combustible gas in the wake of an explosion and the fine coal dust floating in the air.



Illustrating an Explosion of Gas

It will be interesting, in this connection, to consider an explosion of gas as occurring at the face of the return heading, at *A*, in the accompanying figure. The gases produced by the explosion at *A* expand a certain distance down the return heading *C* and, at the same time, are driven through the open crosscut *D*, and outby along the intake airway *B*. If the stoppings on these headings are substantially built, the pressure due to the expanding gases being nearly equal on both sides, it may be assumed that these stoppings will not be thrown down. In that case, the expansion along the return airway *C* will be limited by the force of the initial blast and will die out for lack of air to support the flame. The expansion along the intake airway *B* will probably extend a greater distance, owing to the combustion being fed by the fresh intake air. Much will depend, of course, on the amount of fuel (gas and dust) fed to the flame in its progress along the entry.

Now, consider for a moment what would be the probable effect if these entry stoppings were collapsible. It seems clear that the throwing down of the stoppings in the crosscuts would result in blowing a large quantity of dust into the air, and this dust would feed the flame and add to the force and violence of the explosion. Moreover, the destruction of the stoppings would allow the fresh intake air to feed the explosion on the return airway, and both of these entries would then furnish a path for the explosive wave.

Although the suggested reasoning, in reference to collapsible stoppings, is based upon admissible data, the conclusions reached are not of general application in coal-mining practice. The existing facts and conditions will generally make a vital difference in the results. There is room for much practical experimentation, before the question can be satisfactorily solved in its different phases.

⁂

Mixed Lights in Mining

Letter No. 19—If not too late, I want to express my opinion on the use of mixed lights in coal mining, recently discussed in Coal Age, Oct. 11, p. 553. I consider it a pernicious practice to allow the use of open lights in any portion of a mine generating explosive gas in such quantities as to require the use of safety lamps at the working face. The number of accidents that have occurred and lives that have been sacrificed on the altar of mixed lights are legion.

To illustrate the danger of this practice, I will relate, briefly, one or two incidents that have occurred in my experience. A number of years ago, Chinamen were employed at the Union mine, in British Columbia. They were allowed to work underground and were probably no more an element of danger than the class of foreigners employed today, who cannot speak English. It was the custom, in that mine, to use naked lights on the levels and main air courses, while safety lamps were required in the pillar districts. A Chinaman was tramming on one of the levels. A number of boxes (cars) were off the track and to get some help to replace them, the Chinaman went into the pillar district with his open light. The result was an explosion that killed 21 men.

At Coleman, Alberta, several years ago, an explosion occurred resulting in the death of three men. This accident, also, was the result of using mixed lights in a mine generating gas. In this mine, each miner was provided with a safety lamp for the purpose of examining his place before commencing work, or after firing a shot, or on returning to his place after a short absence. It so happened that an old experienced miner neglected examining his place with the safety lamp, and entered with an open light on his head. As a result, a body of gas was ignited and the explosion that followed caused his death and that of two others.

Neither of these explosions would have occurred had safety lamps been used exclusively throughout these mines. The temptation to use naked lights in a mine whenever these are available is strong, not only among the miners but among mine officials as well. The list of those who have been caught taking this chance includes even mine inspectors. It seems more natural for many mining men to assume that no gas is present rather than to assume that gas may be present.

Such is the history of mixed lights in coal mining in the past, and it will probably repeat itself in the future, as long as the practice is continued.

The only remedy is to eliminate the cause. When it is necessary to use safety lamps at the working face, or in any district of a mine, the entire mine should be worked on safety lamps exclusively. It is common to see walking the streets, in districts where the mixed-light system is practiced, men who are or should be living, animated danger signals, warning all against such practice, by their parched glossy faces and shriveled hands and ears. On the other hand, a sense of security is experienced by most officials and intelligent miners where the practice of mixed lights is not known.

In conclusion, I want to state that a law should be put on the statute books of every coal-mining state, making it compulsory to use safety lamps exclusively where these are required in any portion of a mine. Such a law might seem to impose a hardship on the mining of coal; but, in general, it will prove a blessing in the end, by the lives saved.

J. W. Powell.

Windham, Mont.

⁂

The Safety Lamp and the Eyesight

I cannot agree with John Rose, Coal Age, Sept. 27, p. 465, when he says that the safety lamp has no ill effect on the eyesight of the miner. My observation and personal experience compel me to a contrary belief. In every safety-lamp district in which I have worked or visited, I have observed that the eyesight of the miners has been impaired.

Mr. Rose claims that his use of the safety lamp, as fireboss and mine foreman, produced no ill-effects. I could say the same thing for myself, having worked for several years in the Hamilton district, Scotland, where safety lamps are used almost exclusively. In that district, however, the majority of the *miners* suffer from defective eyesight, while it is rare that the firebosses, drivers and other shiftmen are affected. I know many firebosses, personally, who have used the safety lamp for 20 years and more, and still retain good eyesight. On the other hand, I can recall very few miners whose eyesight remains unimpaired after using the safety lamp, at the coal face, for a much shorter period.

The verdict of eminent medical men, who have given much time to the study of this particular disease—for it is a disease among miners—is that the feeble light afforded by the safety lamp produces a heavy strain on the eyes. They claim that this is much intensified when the man is in a horizontal position, as when mining or undercutting the coal, or when stooping in shoveling. Again, it is well known that severe physical strain has a bad effect on the eyesight; and no one can deny the fact that the miner's occupation is one that produces such strain. Add this to the ill-effects of the feeble light, and it is not difficult to understand why the eyesight of miners is impaired.

Anyone who has lived in a safety-lamp district cannot have failed to have observed the defective eyesight of many of the miners. It is particularly noticeable when the lamps are lit on the street, at night. At such a time, the miner whose eyesight is affected can invariably be observed with his head thrown back and his eyelids drawn close, as though he were looking at something intently. The effect produced on the eyesight by the safety lamp is gradual. In the first stages of the disease, a light seen at a little distance appears for a while to be rotating in a circle, but becomes stationary after a short time. Later, as the disease progresses, the rotation is more or less permanent, and the miner is compelled to stop work. The difficulty seems to be wholly confined to or, at least, greatly aggravated by artificial light. Men who are badly affected and can hardly be trusted to cross the street alone, at night, can often read without the assistance of glasses, in daylight.

In my opinion, the fact that a large percentage of claims paid under the Miners' Compensation Act, in Great Britain, is for this disease, which is known as "miners' nystagmus," proves the bad effect of the safety lamp on the eyesight of miners. I do not remember of ever hearing of a case of nystagmus in naked-light districts. According to medical men, the only cure for the disease is absolute rest for a few weeks or months, according to the severity of the case. The miner must then seek employment on the surface, and away from artificial light. I hope that the attention drawn to the matter by this discussion will warn miners who are using the safety lamp, of the danger to which they are exposed.

James Dickson.

Nanaimo, B. C., Canada.

⁂

Another Letter

The question of the continuous use of the safety lamp affecting the eyesight, which grew out of the discussion of Mixed Lights in Mining, has proved an interesting one. It seems to me, however, that one important particular has been entirely disregarded. Personal experience has been offered, as more or less conclusive proof of the statements submitted. While such experience is often satisfactory to the person, it should not be offered or accepted as indisputable evidence, but an *opinion* based on experience.

Because a certain effect is not produced on one man or individual, he has no right to conclude that such effect will *not* result in the case of another man or individual. Such reasoning would be logical, were we all constituted alike; but the fact that we are not so constituted makes such reasoning illogical.

I have worked a number of years with a safety lamp exclusively, and can conscientiously say that, so far as I can perceive, no ill effect upon the eye has been produced.

However, an oculist might detect that such effect had been produced. We know that the eye, in conformity with the general structure of the body, is designed to adapt itself to varying degrees of light; and this requirement may produce an undue strain on a particular eye, that may injure the organ temporarily or permanently.

Before expressing a hasty opinion, let anyone who claims that the safety lamp is not injurious to the eyes, recall the sensations they have experienced in passing from the gloom of the mine, where the pupil of the eye is dilated to meet the requirements of the feeble light, into the scintillating brilliancy of a bright winter day, when the sunbeams glancing on the crust of the snow compel one to close the eyes to protect them from the glare. A similar effect, to a less degree, is experienced on passing from the glare of such a day into the subdued light of a room or into the darkness of the mine. Then, consider that the eyes of a large number of people may be unable to withstand the strain attending such a sudden transition from darkness to a glare of light or *vice versa*. I feel certain that such ones will be ready, then, to admit that personal experience, in this particular, is not of general application.

The Mine Air Current and Explosion

My attention was called some time since to Robert M Cune's reply, COAL AGE, Sept. 13, p. 390, to my previo article on the above subject. I do not consider it wor while to reply to his comments, as your editorial note o p. 391 points out the fact that I attempted to expres far more clearly and comprehensively than any effort c my part could possibly accomplish.

I do not think, however, that the mathematics he pr sents helps to establish his claim that the compressiv system of ventilation as compared with the exhaustiv system counteracts, to any appreciable extent, the effe of a falling barometer. He assumes a fall of barometr pressure from 30 to 29 in. This corresponds to an a mospheric pressure of 0.49 × 144 = 70.56 lb. per sq.ft or a water gage of nearly 14 in. It is quite clear, ther fore, that the difference between the two systems of ve tilation, which he shows to be twice the ventilating pre sure or, say 4 in. of water gage, would have little e fect in counteracting the assumed change in atmospheri pressure, which corresponds to nearly 14 in. of gage. I is a dangerous thing to apply mathematics to mine ve tilation unless the application be correctly made.

Study Course in Coal Mining

By J. T. BEARD

The Coal Age Pocket Book

FACTORING

The smaller numbers are readily factored by inspection. Following are examples of such simple factoring:

Number 8; factors, 2, 4; because 2 × 4 = 8;
Number 24; factors, 4, 6; because 4 × 6 = 24; etc.

Prime Factors—It is evident that the factors given above are not, in either case, the prime factors of the number; because the factors themselves can some of them be resolved into lower factors. The numbers 4 and 6 are not prime numbers and cannot therefore be prime factors. The following are examples of prime factoring:

Number, 8; prime factors, 2, 2, 2;
Number, 24; prime factors, 2, 2, 2, 3;
Number, 30; prime factors, 2, 3, 5; etc.

Factoring Larger Numbers—Numbers that cannot be factored readily by inspection must be factored by a process of continued division of the number by any exact divisor of the number and, finally, reducing each divisor to its prime factors, which are then the prime factors of the given number.

Exact Simple Divisors—A number is exactly **divisible by 2** when its last figure is a cipher or an even number; in other words, 2 is an exact divisor of any even number.

A number is exactly **divisable by 3 or 9** when the sum of its digits is divisible by 3 or 9; or, as we say, is a multiple of 3 or 9, respectively. Thus, 27 is exactly divisible by both 3 and 9; because 2 + 7 = 9 which is divisible by each. Again, the following number is divisible by 3, as shown, but not by 9:

Number, 38,769,576 divisible by 3; because

$$3 + 8 + 7 + 6 + 9 + 5 + 7 + 6 = 51;\ \text{and}\ 5 + 1 = 6$$

As above, the number may be so large that the sum of its digits may not be recognized, at once, as a multiple of 3, in which case, the digits of that sum may be added and this process repeated, if necessary, till the resulting sum is readily recognized as a multiple of 3 or otherwise.

The operation may be much shortened, however, by omitting to add any digit as 3 or a multiple of 3. For example, in the number above, adding all the digits except the multiples 3, 6, 9, gives:

$$8 + 7 + 5 + 7 = 27;\ \text{and}\ 2 + 7 = 9$$

If desired the operation may be further shortened by throwing out all multiples of 3 from each digit and only adding the excess in each case. Thus, in the above, instead of adding the digits 8, 7, 5, 7, we add

$$2 + 1 + 2 + 1 = 6,$$

which is the shortest and simplest of all the methods.

A number is exactly **divisible by 4** when its last two digits are so divisible; because the figures preceding the last two are a multiple of 100, which is a multiple of 4 and can therefore be cast out. Thus, 124, 332, 504, etc., are each divisible by 4; because 24, 32, 4, etc., are each multiples of 4.

A number is **divisible by 5** when its last figure is a cipher or a 5; as for example 105, 130, 375, etc.

The Coal Age Pocket Book

Reduction of Simple Fractions—To reduce a simple fra tion to its lowest terms, one of the three following methd may be employed:

(a) Divide both terms of the fraction by all the factor common to both; thus,

$$2\,\Big|\,\frac{32}{120};\quad 2\,\Big|\,\frac{16}{60};\quad 2\,\Big|\,\frac{8}{30} = \frac{4}{15}$$

(b) Divide, at once, by the **greatest common divisor** o both terms of the fraction, which is the product of all th common factors and will be explained later; thus,

$$8\,\Big|\,\frac{32}{120} = \frac{4}{15}$$

(c) The method by **cancelation** is to first resolve eac term of the fraction into its prime factors and, then, to ca out those common to both numerator and denominator. Th product of the factors remaining in each term will form th terms of the reduced fraction. Thus, reducing both terms o the fraction to their prime factors and canceling the sam number of common factors in each term gives the following

$$\frac{32}{120} = \frac{2 \times 2 \times 2 \times |\, 2 \times 2}{2 \times 2 \times 2 \times |\, 3 \times 5} = \frac{4}{15}$$

To Reduce a Mixed Number to an improper fraction, mul tiply the whole number by the denominator of the fractio and to the product add the numerator. Write the sum ove the denominator for the improper fraction required. Thus reduce 3⅝ to an improper fraction:

$$3 \times 8 + 5 = 29;\quad \frac{29}{8}$$

To Reduce an Improper Fraction to a mixed number, di vide the numerator of the fraction by its denominator; th quotient will be the whole number following which write th remainder over the denominator. The result is the mixe number required. Thus, reduce 29/8 to a mixed number:

$$29 \div 8 = 3\tfrac{5}{8}$$

To Reduce a Complex Fraction to a simple one, multiply both the numerator and the denominator, in turn, by the de nominator of each mixed number in the terms of the fraction

Examples—

Reduce $\frac{2\frac{3}{4}}{6}$; thus, $\frac{4 \times 2\frac{3}{4}}{4 \times 6} = \frac{11}{24}$

Reduce $\frac{8}{2\frac{1}{2}}$; thus, $\frac{2 \times 8}{2 \times 2\frac{1}{2}} = \frac{16}{5} = 3\frac{1}{5}$

Reduce $\frac{4\frac{5}{8}}{1\frac{2}{3}}$; thus, $\frac{8 \times 4\frac{5}{8} \times 3}{3 \times 1\frac{2}{3} \times 8} = \frac{111}{40} = 2\frac{31}{40}$

To Reduce a Compound Fraction to a simple one it is necessary to perform the several operations indicated by the signs in the numerator and denominator of the fraction, as explained later in Addition, Subtraction, Multiplication and Division of Fractions.

INQUIRIES OF GENERAL INTEREST

The Mine Foreman's Certificate

I want to ask for a little information in regard to the ine foreman's certificate required by law and for which ne must pass an examination. Is the certificate granted y an examining board in one state good only in that tate, or can it be used in any other state where a certificate is required?

Also, can a mine foreman hold that position in a state here certificates are granted, if he has not obtained his ertificate? As this is being done in some instances, at he present time, it would seem unnecessary to study and ass an examination to secure a certificate.

A MINE FOREMAN.

Scranton, Penn.

The law requiring the examination and certification f mine foremen is a state law in every case. The requirements are different in different states, and these depend largely on the conditions that exist in the mines of each particular state. As the law makes the examining board responsible for the certification of mine foremen, few examining boards will accept the certificate granted by a board in another state, although that is done in some states.

⁂

Expansion of Air and Gas

Following my inquiry in regard to the unit weight of air, which was answered in COAL AGE, Oct. 11, p. 555, I have been puzzled in regard to the application of Gay Lussac's law relating to the expansion of air and gas. I reasoned as follows: If, under constant pressure, air expands $^1/_{460}$ of its volume for every degree of increase in temperature, a volume of 1 cu.ft. of air or gas at absolute zero (—460° F.) would become only 2 cu.ft. at 0° F. But a volume of 460 cu.ft. at 0° F. would, by the same law reversed, be contracted to nothing, at the absolute zero of the Fahrenheit scale.

Again, using the formula given for finding the weight of 1 cu.ft. of air at any temperature t and pressure B; and assuming $B = 30$ in., and $t = -460$ deg.

$$w = \frac{1.3273 \times B}{460 + t} = \frac{1.3273 \times 30}{460 - 460} = \frac{39.819}{0} = 0$$

Now, assuming a volume of 460 cu.ft. at 0° F., a *rise* of 460 deg., in temperature, will cause this air or gas to double its volume. But, assuming a *fall* of 460 deg., in temperature, if the contraction of volume follows the same law it would seem that the volume of the air or gas at absolute zero (—460° F.) would contract to one-half its volume at 0° F.; or ½ × 460 = 230 cu.ft. Will you kindly explain this discrepancy.

I. C. PARFITT.

Jerome, Penn.

The expansion and contraction of air and gas follow the same law, known as Gay Lussac's law, which is as follows:

For a constant pressure, the volume of air or gas expands or contracts $^1/_{460}$ of its volume at 0 deg. F., for each degree rise or fall in temperature (Fahrenheit scale).

Applying this law to the expansion and contraction, respectively, of 460 cu.ft. at 0° F., gives an increase and decrease, respectively, of 1 cu.ft. for each degree rise and fall of temperature. Thus, the increase is 460 cu.ft. for a rise of 460 deg., in temperature; and, likewise, the decrease in volume is 460 cu.ft. for a fall of 460 deg. in temperature; assuming that the law held true throughout this range of temperature.

With the improved means of obtaining very low temperatures, this law has been tested in relation to the contraction of volume in air and gas, and has been found to vary slightly as the temperature approached more nearly to the absolute zero. The contraction of volume becomes less and less as the temperature is decreased below a certain point. The accompanying diagram illustrates clearly this point. The expansion line is shown to assume a gradual curvature that may be supposed to slowly approach parallelism with the vertical line of temperatures. In the diagram, the horizontal lines drawn between the vertical and the expansion line may be taken as representing the volumes of the air or gas at the several temperatures indicated.

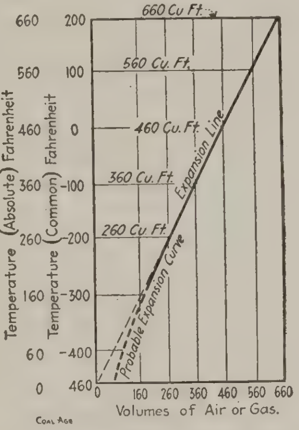

DIAGRAM SHOWING EXPANSION LINE FOR AIR AND GAS

The reasoning in this inquiry errs in two respects:

1. According to Gay Lussac's law, the expansion and contraction, is $^1/_{460}$ *of the volume of the air or gas at 0° F.*, which makes the increment in either case, constant. The total increase, in this case, is equal to the original volume at *0°* F. (460 cu.ft.) and the volume is, therefore, doubled; but it does not follow that a like *fall* of temperature would make the volume one-half of the original volume. On the contrary, assuming the law held true, the volume would reduce to zero, the contraction being 460 cu.ft.

2. Applying the formula for finding the weight of 1 cu.ft. of air, at a given temperature and pressure, our correspondent finds that air, at a barometric pressure of 30 in. and at a temperature of absolute zero would lose its weight, which he calculates would become zero; whereas, if the law held true at such a low temperature, the weight of the air, as shown by the formula, would be infinite. A finite quantity divided by zero gives infinity. But, as we have previously explained, the law of Gay Lussac does not hold true, as the temperature approaches the absolute zero.

EXAMINATION QUESTIONS

Miscellaneous Questions

(*Answered by Request*)

Ques.—How would you proceed to examine a large anthracite colliery for the first time, for the purpose of making a report of the same to the State Department of Mines, assuming that you are wholly unacquainted with the colliery?

Ans.—Visit the mine without previous notice to the mine officials. Proceed at once to the office and examine carefully the mine map to ascertain the system of ventilation, distribution of air and the disposition of the men in the mine. Become thoroughly acquainted with the entire surface plant and its requirements; inspect the ventilating apparatus, hoisting arrangements, boiler plant; and give particular attention to the various safety devices installed and signal systems employed. Also, investigate the arrangements for the handling of supplies, such as timber, powder, hay, oil, etc. Investigate the general lighting system of the mine, the lamp house where safety lamps are used; and, if mixed lights are allowed, ascertain what precautions are adopted to prevent the occurrence of accidents common to this practice.

After a careful study of the entire surface plant and obtaining all the necessary information in reference to the mine, proceed to the bottom of the shaft and study carefully the general arrangements for the handling and hoisting of coal, tools, supplies and men. Observe carefully the manner of conducting operations at the shaft bottom; test the signal system; observe that all lights are well protected and investigate thoroughly all electrical installations. Visit all underground engine rooms, pump rooms, tool shanties, oil and lamp stations, to ascertain that the arrangements in each case are fireproof and otherwise safe. Visit the stables, observe their sanitation, with respect to drainage and ventilation; also, the method of lighting the stables.

Then proceed inby, following the general course of the air current and observing the conditions of the haulage roads, side tracks and air courses. Visit, in order, all chambers and other working places. Observe carefully the method of mining and blasting the coal, timbering the working places and note the condition of the workings with respect to gas and dust. See that every working place is thoroughly ventilated, the air being conducted to the face by brattices where necessary. See that all stoppings are properly built and of incombustible material, and that all crosscuts are of sufficient size and unobstructed. Investigate the practice of the miners in respect to the handling of powder, charging of holes and firing.

Ques.—A coal seam 6 ft. 6 in., in thickness, including 18 in. of dirt band, is standing on pillars. The rooms or stalls have been driven 14 ft. wide, and 15 per cent. of the coal has been taken out in the first working. Overlying this is a seam of coal that has been abandoned—"drowned out." The two seams are separated by 300 ft. of beds of soft shale and fireclay. State how you would proceed to extract the pillars in the lower seam with bringing the water down from above.

Ans.—The thickness and character of the interveni strata are such as to permit of drawing the pillars the lower seam on the retreating system. The soft, sha strata will favor the gradual subsidence of the roof, wh the beds of fireclay will form a good protection aga the inflow of water from above. It is important, ho ever, that the work of drawing the pillars should started at the inby end or boundary of the workin and that the pillar work should be kept in line so that subsidence of the roof will be uniform and gradual a that the strata will have no tendency to "draw." If rooms are 14 ft. wide and 15 per cent. of the coal been extracted, leaving $100 - 15 = 85$ per cent. in pillar, the width of the pillars is found thus:

$$15 : 85 : : 14 : x = 79.3, \text{ say } 80 \textit{ ft.}$$

The pillars should be drawn by taking a skip of, 6 or 8 ft. off the face of the pillar, extending this entire width of the pillar before another skip is start

Ques.—Two drill holes are put down, one mile apa to prospect a seam of coal. The depth of the first h is 634 ft., that of the second, 850 ft. The surface at first hole is 25 ft., vertical measurement, above tha the second. Find the inclination of the coal seam tween the two points, measured in inches per yard.

Ans.—Add the difference in surface elevation to depth of the second hole and from this sum subtract depth of the first hole. Thus, $850 + 25 - 634 = 2$ ft. The inclination of the seam between these t points is, therefore, 241 ft. in 5280 ft. (1 mile). Si there are 36 in. in a yard, the inclination or dip of seam, in inches per yard, is found by the proportion

$$5280 : 241 : : 36 : x = 1.64 \textit{ in. per yd.}$$

Ques.—With a fan of 50 hp., the water-gage sta at 1.75 in.; what quantity of air should be in circulati if the efficiency of the fan engine is 65 per cent.?

Ans.—Taking the 65 per cent. to represent the e ciency of the fan and engine, the power on the air is $Qp = 0.65\ (50 \times 33{,}000) = 1{,}072{,}500$ *ft.-lb. per m*

The unit of ventilating pressure is $p = 5.2 \times 1.7$ 9.1 lb. per sq.ft. The quantity of air in circulation, this case, is, therefore,

$$Q = \frac{1{,}072{,}500}{9.1} = 117{,}850 \textit{ cu.ft. per min.}$$

Ques.—We have a tank full of water in the morni when commencing work. Using 900 hp. per hr., long will it take to empty this tank? The tank is 10 in diameter and the water 15 ft. deep.

Ans.—The weight of water in the tank is $15\ (0.7 \times 10^2) \times 62.5 = 73{,}631.25$ lb. In the absence of ex data in regard to the style of engine, temperature of water, etc., it is customary to assume a consumption 35 lb. of water, per horsepower, per hour. On this bas the water in the tank will last

$$\frac{73{,}631.25}{900 \times 35} = 2.33 \textit{ hr.}, \text{ or } 2 \textit{ hr. } 20 \textit{ min.}$$

COAL AND COKE NEWS

Washington, D. C.

The first important step toward the application of the income tax was taken by Secretary McAdoo late on Saturday, Oct. 25, and consisted of the issuance of rules governing the application of the law and the collection of the income tax from individuals. The mechanism now in force for the collection of the corporation tax was not changed but it is understood that that is to remain practically in operation as now. The new rules applicable to individuals are however of great importance in their bearing on corporations, including those engaged in mining, because they lay upon these corporations the duty of collecting the tax at the source, by deducting from the amounts they pay to individuals the proportion which is due to the Government.

The new rules are elaborate and detailed, including a great many forms. These will be freely sent out to all corporations including mining companies which have bonds outstanding. The main part of the regulations, apart from the forms includes the following points:

Under the Income Tax Law, enacted Oct. 3, 1913, a tax of one per cent. designated in the law as the normal tax, shall be deducted at "the source," beginning Nov. 1, 1913, from all income accruing and payable to:

(a) Every citizen of the United States, whether residing at home or abroad, and to

(b) Every person residing in the United States, though not a citizen thereof, which may be derived from interest upon bonds and mortgages, or deeds of trust, or other similar obligations, including equipment trust agreements and receivers' certificates of corporations, joint stock companies or associations and insurance companies, although such interest does not amount to $3000, excepting only the interest upon the obligations of the United States or its possessions, or a state or any political subdivision thereof.

The term "debtor," as hereinafter used, shall be construed to cover all corporations, joint stock companies, or associations and insurance companies.

For the purpose of collecting this tax on all coupons and registered interest, originating, or payable, in the United States the source shall be the debtor (or its paying agent in the United States) which shall deduct the tax when same is to be withheld, and no other bank, trust company, banking firm, or individual taking coupons for collection, or otherwise, shall withhold the tax thereon; provided that all such coupons, or orders for registered interest, are accompanied by certificates of ownership signed by the owners of the bonds from which the coupons were detached. These certificates shall be in the forms prescribed and a separate certificate shall be made out by each owner of bonds for the coupons or interest orders for each separate issue of bonds or obligations of each debtor.

If, however, the coupons are not accompanied by certificates as prescribed above, the first bank, trust company, banking firm or individual or collecting agency receiving the coupons for collection or otherwise, shall deduct and withhold the tax and shall attach to such coupons its own certificate, giving the name and address of the owner of, or the persons presenting such coupons if the owner is not known, with a description of such coupons also setting forth the fact that they are withholding the tax upon them; whereupon the debtor shall not again withhold the tax on said coupons, but in lieu thereof shall deliver to the government the certificate of such bank, trust company, etc., which is withholding such tax money.

Any corporation, collecting agency, or person first receiving from the owner any interest coupons or orders for the collection of registered interest, and to whom the certificates above provided for are delivered, should require the persons tendering such coupons or orders for registered interest to satisfactorily establish their identity.

A debtor whose bonds may be registered both as to principal and interest, shall deduct the normal tax of 1 per cent. from the accruing interest on all bonds before sending out checks for said interest to registered owners or before paying such interest upon interest orders signed by the registered holders of said bonds until there shall be filed with said debtor or its fiscal agent (and not later than 30 days prior to Mar. 1) through whom said interest is customarily paid, the proper certificates claiming exemption from liability for said tax.

The debtor may appoint paying or fiscal agents to act for it in matters pertaining to the collection of this tax upon filing with the collector of internal revenue of its district a proper notice of the appointment of such agent or agents.

HARRISBURG, PENN.

The Philadelphia & Reading Ry. Co., the Philadelphia & Reading Coal & Iron Co., the Reading Co. and the Wilmington & Northern R.R. Co., principal defendants in the Governments' suit to dissolve the so called "Anthracite Coal Trust," filed separate answers in the United States District Court, recently at Philadelphia, making general denial to the charge of having formed an illegal combination to stifle competition in the sale and transportation of anthracite coal in Pennsylvania.

It is understood these answers will form the defense of all the defendants in the suit. Each answer gives a detailed denial in so far as the Government's allegations affect the individual company.

Each denies "that it is a party directly or indirectly, to any agreement, contract, combination or conspiracy, by virtue of which it, either alone or in combination with the other defendants or any of them or otherwise, has acquired the power now or hereafter to control, regulate, restrain or monopolize, or by virtue of which it, either alone or in such combination does control, regulate, restrain or monopolize, either the production of anthracite, or its transportation from the mines of Pennsylvania to market points in other states, or its price of sale, in or throughout other states."

The Reading Co. admits that it is the holding company of the Philadelphia & Reading Coal & Iron Co., and the Philadelphia & Reading Railway Co., also that it owns nearly all the capital stock of the Wilmington & Northern R.R., the Schuylkill Navigation Co., and the Central Railroad of New Jersey. It denies specifically, however, that the company was made an instrument to accomplish an unlawful purpose.

It is further averred that the plan for the reorganization in 1896 of the Railway Co. and the Coal & Iron Co., was for the purpose of saving large investments of the public and was done under the law of Pennsylvania. It is denied that the Reading Co., the Railway Co. and the Coal & Iron Co., are one and the same association of persons engaged in mining, selling and transporting coal.

The Reading Co. denies that the purchase of the majority of stock of the railroads was made to effect a monopoly, but says it was done in the natural course of business, the railroads being connecting lines.

The Philadelphia & Reading Ry. points out that substantially all the anthracite not consumed near the mines moves to market over ten railroads, that New York Harbor and Philadelphia are important markets, that Philadelphia is reached over the lines of the defendant and those of the Pennsylvania R.R.; and that a substantial tonnage is distributed by water from Philadelphia to New England.

Attention is called to the fact that during the fiscal year ending June 30, 1912, the company transported 11,224,945 gross tons of anthracite, it transported 14,806,220 tons of bituminous coal and 22,711,791 net tons of general merchandise.

The Philadelphia & Reading Coal & Iron Co. admits holding the major portion of stock of six coal companies, which own 9000 acres of coal lands in the Schuylkill Region. All was purchased in the lawful course of business, it is averred. It is admitted that, since 1896 the Reading Co. has, from time to time, made to the Coal & Iron Co. temporary commercial loans, but that these are usually repaid within a few months.

The Wilmington and Northern R.R. Co. admits that a majority of its stock is owned by the Reading Co. It denies that anthracite constitutes its principal freight, and that the acquisition of its stock by the Reading Co. had any tendency to accomplish an anthracite monopoly.

Valuation Decision Is Upheld

The Supreme Court of Pennsylvania has handed down a decision that the County Commissioners of Westmoreland County could not appeal from the ruling of the Court of Common Pleas in fixing the valuations of coal lands for taxation purposes.

The Common Pleas Court of Westmoreland County sat as a board of revision and appeals June 11, and heard the complaint of the Pittsburgh Coal Co., Henderson Coal Co., Monongahela River Consolidated Coal & Coke Co., Elizabeth Stauffer Moore, Laura A. Hasson, Monessen Coal Co., Shenango Furnace Co., Pittsburgh-Westmoreland Coal Co., and the Naomi Coal Co. The Court ruled that the county commissioners had exceeded their authority in fixing the value of coal lands for taxation purposes and ordered relief for the coal-land owners.

The county commissioners then carried the case to the Supreme Court of the state, which held that the commissioners' appeal would not lie, dismissed the case and directed that Westmoreland County pay the costs.

PENNSYLVANIA

Anthracite

Hazleton—The Lehigh Valley Coal Co. has made arrangements for opening a new coal stripping between Drifton and Freeland, extending toward Highland.

Wilkes-Barre—The various United Mine Workers locals have received notice that the levy of 50 cents per month on all members will be continued for the time being for the benefit of the striking Colorado miners and their families. District No. 9, has also made a loan of $25,000 to the striking miners in the Colorado District.

Shamokin—Coal companies who maintain alleged blacklists whereby a number of employees are discriminated against and which prevents them from getting positions at the mines of such corporations, were scored by a number of delegates at the annual convention of the Ninth District United Mine Workers. A resolution was offered to have the convention go on record condemning the practice.

Scranton—Pending a report from the special commission which is to make an examination of the conditions underlying West Scranton and also to check up the work of the city mine cave commission, the members of the West Scranton Surface Protective Association have deferred action on the propositions submitted by the People's Coal Co. to serve as a solution of the mine-cave menace in that section. The latest offer of the People's Coal Co. was submitted in a report from a committee of twelve. Briefly, the offer is that, commencing in November, the company will set aside ten cents on every ton of coal mined, this amount to be used as a fund for assisting in the repairing of frame buildings, etc., damaged by caves

Bituminous

Washington—In the suit of the Pittsburgh Coal Co. of Penn. against W. H. Brunt, executor of Francis L. Robbins' will et al., exceptions to the adjudication of the court, an opinion has been handed down, overruling all exceptions and directs the adjudication to stand as heretofore filed. This is the action involving the deed to 97 acres of coal, underlying the Washington fair grounds. The amount of the claim against the estate is about $300,000, Francis L. Robbins, who formerly owned the land, was at one time president of the Pittsburgh Coal Co.

Johnstown—Judge Stephens scored mine officials who violate the state mining laws in no meek terms, when William Roberts, a mine foreman, plead guilty to violating the mining laws. Some time ago Superintendent Andrews of the mine in which Roberts is employed plead guilty to making false air returns to the mine inspectors and blamed his trouble on Roberts, stating the foreman had made false returns to him in the air tests. Roberts placed the blame on the gage which he used in testing the air, stating that it was defective, and that as a result no return of the air pressure was made by him.

Waynesburg—The W. Harry Brown Coke Co. is making extensive preparations previous to the operation of the new mine which is being opened in the Dunkard Creek region. Several months ago the Brown Co. purchased a tract of 1500 acres and immediately let contracts for the development of the underlying coal. The Brown Co. has purchased the steamer "G. W. Thomas" from the Peoples Coal Co., which has been idle for the past three years. In addition to purchasing the steamer it is authentically reported that several other important steps had been taken toward the immediate development of the mine on the Gray Landing. No coke will be made except at the Alicia plant. It being the plan to transport the coal down the river.

Charleroi—Negotiations have been completed and the work of title investigation and deed transferring is now underway for the sale of a 5000-acre block of coal in Cumberland township, Greene County. A large steel corporation operating extensively in the Pittsburgh district is reported be the purchasing company. Western Pennsylvania financie and coal dealers, among whom is said to be J. V. Thompso the Uniontown coal king, are rumored to be the sellers the tract. Approximately $5,000,000 will be paid for t coal, at the rate of $1000 an acre.

WEST VIRGINIA

Elkins—The Jenkins Coal Co., which has been operati a small mine near Mabie for some time, has commenced t construction of extensive mining operations near the san place. Within the next few weeks a considerable plant modern electrical mining machinery will be in operatio which will vastly increase the output of the mines.

Fairmont—The car supply in this region is anything b ideal. On Oct. 22 the Consolidation Coal Co. had no less tha 42 mines shut down on account of lack of cars. It is claim by the railroad authorities that these conditions will be in proved when the Monongah Cutoff is constructed.

Williamson—A combination of capital represented b Patrick Grady has leased several hundred acres of coal lar owned by the Lawson Land Co. surrounding this city. large coal operation will be started in the immediate futu with the tipple in the Norfolk & Western yards. The pla will be operated by elevator conveyors, and the Norfolk Western Ry. will consume the entire output.

TENNESSEE

Briceville—Citizens of Briceville are contributing ge erously for the purpose of building a monument to the mer ory of the 84 men and boys who lost their lives in the Cro Mountain mine explosion of Dec. 9, 1911, near that plac Employees of the Coal Creek Coal Co., the Tennessee Co Co., the Minersville Coal Co., the Westborne Coal Co., th Caryville Coal Co., the Sun Coal Co., the Egan Coal Co., th Peabody Coal Co., the Rich Mountain Coal Co., and the Kim berly Coal Co. among others in that section, and many othe citizens, have made substantial contribution to the fund, ar indications are that a sufficient sum will be collected to ere a handsome memorial.

Jellico—Plans are under way, supported by a number o the coal companies in and around Jellico, Tenn., for the es tablishment of a permanent mine rescue school at that plac for the purpose of facilitating the thorough instruction o miners in first-aid work. E. B. Sutton, who is connecte with the mine-rescue station at Knoxville, Tenn., will hav charge of the school, if sufficient interest is taken by th operators to warrant its establishment, and modern equip ment will be secured and used in order to get the best re sults. Examinations will be conducted following the demon strations of various phases of rescue work, and first-ai certificates awarded to the men who show a proper under standing of the methods used.

KENTUCKY

Lexington—The next examinations for the purpose of de termining the qualifications of applicants for mine fore men's certificates will be held at the office of the Inspector o Mines at Lexington, Ky., on Monday, Nov. 24. The examina tions will continue for several days.

Whitesburg—It is reported that arrangements are unde way for another big development project in the Lowe Boone's Fork section, J. L. McCormick, of Big Stone Gap Va., D. C. Anderson and J. B. Altemus, of Philadelphia, bein among those interested. These men arrived at Whitesbur recently and left for the section referred to, for the purpose of laying out plans for the beginning of active developmen work. It is said that several million dollars will be expended on mining operations and the building of two new industrial towns.

Harlan—Negotiations are under way by the Harlan Coa Mining Co. for the purchase of mechanical equipment for its Coxton No. 2 mine, which it will operate. The equipment wil be of the most modern character, and as good as anythin now installed in Kentucky.

OHIO

Columbus—The past week was taken up by the Ohio min commission in taking testimony from both the operators and miners on the question of paying for coal mined on the mine-run basis. The miners produced testimony in an effort to rebutt the evidence of the operators. The following week will be given over to arguments and after that the report will be prepared.

Logan—Over 100 men have been employed at the Peabody Coal Co.'s mine at Job, Hocking County, and it is believed that 200 more will be taken on soon. In the future it is expected to operate the mine 12 months out of the year. The mine had been closed since last February.

Massillon—What is said to be the last existing undeveloped acreage of genuine Massillon coal has just been opened by the Pocock Coal Co., of Massillon, near Newman. The coal once made the Massillon district famous. The mine was opened after several companies had drilled the 40-acre tract and decided that no coal was to be found. At one time thousands of miners were employed in that district, but as the coal became exhausted the industry died out. The new mine will employ several hundred men.

INDIANA

Evansville—Judgment was rendered recently in the Federal Court at Evansville, in favor of Henry B. Walker, trustee in bankruptcy of the Kimberly Mining Co., for a 3½ per cent. assessment against the stockholders for the purpose of paying the debts of the company. The assessment will aggregate about $2500.

Fort Branch—After burning two days in a room of a mine of the Fort Branch Mining Co., a fire was got under control. It was caused by shots fired after the miners quit work and slate falling from the roof bottled up the flames. The mine rescue car was called from Clinton.

Sullivan—The suit of the county treasurer versus the Shirley Hill Coal Co., in which the latter sought to enjoin the treasurer from collecting alleged omitted taxes of $2000 has been compromised by the payment of $281.

ILLINOIS

Marion—The strike on the Coal Belt Electric Line, which tied up transportation facilities to the various mines between Marion, Herrin, and Carterville, has been settled, the company granting a slight increase to its employees.

Duquoin—The Paradise mine, the top works of which were destroyed by fire early in the summer, has resumed operations. This is supposed to be one of the best-equipped surface plants in southern Illinois, and it is anticipated that 2000 tons per day will be produced in the course of the next six weeks. This is considered a model mine in the way of conveniences for its help.

Sparta—The Moffatt Coal Co. has removed its general offices from here to the Wright Building in St. Louis, with the purpose of handling the future tonnage through the St. Louis gateway. Mr. W. J. Rich is in charge of the St. Louis office. The Illinois Fuel Co. has likewise made arrangements for selling its tonnage through St. Louis, with the Dealers' Fuel Co. as distributors.

Oakland—While drilling for oil wells on the Nolan and Temple farms near here, a vein of coal was struck 10 ft. thick with a good slate roof, it is reported.

MISSOURI

Kirksville—The Star Coal Co., operating the mine of that name at Kirksville, has completed the installation of electrical equipment in a second vein which is now being worked. A road recently built from Kirksville to the mine has been put into commission, facilitating the company's operations.

IOWA

Cleveland—The old No. 2 shaft of the Whitebreast Fuel Co., abandoned some years ago, has been recently reopened, for the purpose of working the top vein, for the supply of the local coal trade. The shaft was found in a remarkable state of preservation, the walls being in perfect alignment. This shaft was sunk about 1880, and, for 12 years, was one of the largest coal producers in the state. After that time, the output declined and operation was finally abandoned by the Whitebreast company. Lately it has been operated spasmodically to supply local trade.

NORTH DAKOTA

Minot—The machinery for Minot's briquetting plant has all arrived, and it is expected that the plant will be in operation in a short time. This is the first plant of its kind to be built in the state. The methods of operation have, however, been worked out, and it is confidently expected that briquetting will, with the starting of the plant, be placed upon a satisfactory commercial basis.

COLORADO

Denver—Petitions, designed to determine whether public sentiment would support a proposal for the state to seize and operate the coal mines until the settlement of the strike, were put into circulation Oct. 20 by various labor organizations.

Crested Butte—Two hundred and fifty employees of the coal mines in the vicinity of Crested Butte walked out Oct. 20 in sympathy with the striking coal miners in the Trinidad district. They declare they have no grievance except that they wish to have the union recognized.

FOREIGN NEWS

There is an insistent rumor seriously accepted in Europe that China has granted to Japan the exclusive privilege of developing the coal fields of China. If this be true, the concession gives Japan the most valuable monopoly that was ever granted by any nation. China has possibly more coal than is known in all the rest of the world, there being in that country 30,000 square miles known to be rich coal deposits.

Edmonton, Alberta—The coal output of Alberta for 1912 is placed at 3,500,000 tons, out of a total of 13,000,000 tons for all Canada, taking in seven provinces, the Yukon and Northwest territories and the Arctic Islands. Alberta is credited with 14½ per cent. of the total coal resources of the world, the reserves of the province being estimated to contain 1,075,039,000,000 tons as compared with 160,841,910,000 tons for the rest of Canada.

PERSONALS

Samuel W. Eldred, manager of the Wabash Coal Co., was recently elected a member of the executive board of the third district by the Illinois Coal Operators' Association.

All Officials and Directors of the Colorado Fuel & Iron Co., and those of its twelve subsidiary concerns, were reelected at annual meetings of stockholders and directors, Oct. 20.

James Matthews, of Shenandoah, Penn., has been reelected president of the ninth district of the United Mine Workers by a vote of 10,564 against 4338 for Thomas Butler, of Jirardville.

Arthur Mitchell, who has been inspector of mines for the state mining department of West Virginia for the last five years, has resigned to become superintendent of the Marvin Colliery at Matewan. He will enter upon his new duties on Nov. 1.

Myron G. Doll, for several years local manager of the Sullivan Machinery Co.'s office at Salt Lake City, has resigned, and H. E. Moon, heretofore associated with the Denver office of the same company, has been appointed as his successor.

Frank E. Getts, on Oct. 20, took charge as district sales manager of the Chicago office of the Alberger Pump & Condenser Co., of New York. Mr. Getts is well known throughout the United States in connection with important steam turbine installations.

James Abercrombie, mine superintendent at Browder, Ky., for the Muhlenberg Coal Co., suffered an accident at the mine recently which may result fatally. A fall of earth upon a timber in the shaft, upon which he was standing, caused him to fall to the bottom of the shaft, which is about 75 ft. deep. He is believed to be injured internally.

OBITUARY

Edwin M. Crickmer, an extensive coal operator of West Virginia, died Oct. 22 as the result of an injury received in the mine ten years ago. He had been an invalid for a number of years, but his condition was not thought serious until shortly before his death.

H. D. Dennis, president of the Morgan Run Coal Co., of Coshocton, Ohio, died at his home in Cleveland recently at the age of 62 years. For more than 30 years he was connected with the Morgan Run Coal Co. and was one of the best-known coal men in the state.

Gordon C. Wilson, a well known operator of Pittsburg, Kan., fell dead recently at Joplin, Mo. Mr. Wilson was visiting a friend when the attack came, and death was instantaneous. The operator was 38 years old and was interested in several mines in Pittsburg.

Thomas Longstaff, who has been connected with the St. Bernard Mining Co., at Earlington, Ky., for nearly 40 years, died recently at that place at the age of sixty-six. He was buried with Masonic honors. He is survived by his widow and a number of children and grandchildren.

CONSTRUCTION NEWS

Pana, Ill.—The Peabody Coal Co. has started the work of building at Kincaid, about the middle of Christian County, a large power house to furnish electricity to many central Illinois industries.

Butler, Penn.—The Blackstone Coal Co., now holding options on 20,000 acres in Forward and adjoining townships, will soon begin work on a large colliery near Buhl Station on the Baltimore & Ohio R.R., and a new town will be established there. Two additional collieries will be located near McBride.

Sterling, Ill.—The Chicago & Northwestern Ry. is building roads into every coal district which may be easily reached from the main line. The officers and directors have been authorized to extend the line from Girard and Benld 10 miles into Madison County, Ill., also a line into the coal territory west of Miami, Iowa.

Minneapolis, Minn.—The Pittsburgh Coal Co. has plans for the construction of one of the largest, if not the largest, coal-storage plants in the United States. The capacity will be between 20,000 and 25,000 tons. A concrete wall will be put along the sides of the yard, and a "clamshell" handling plant will be installed. It is expected that work upon this plant will be begun early next year.

St. Charles, Va.—The Electric Transmission Co. has been purchased by Samuel Insull, of Chicago, who controlls a large number of public utilities all over the country. The plant will be enlarged at once for the purpose of providing for a much larger production of current. Mr. Insull proposes to utilize the large coal fields in the vicinity of St. Charles for the cheap production of electricity for long-distance transmission, as well as for use in mining operations in southwestern Virginia.

Uniontown, Penn.—Improvements aggregating $90,000 are under way by the Brownsfield-Connellsville Coke Co. at its Martha and Marie mines at Tarr Station, Westmoreland County. Among these improvements are new tipples which are being built at an approximate cost of $12,000 to $15,000. Also 72 new ovens are being erected by the company at the Myers plant. The Wineland-Gilmore Coal & Coke Co. is installing a new plant at Smithton, Westmoreland County. This firm owns approximately 100 acres in its Smithton tract, and is putting in a plant of 60 bank ovens with facilities for shipping both coal and coke. The Luzerne Coke Co. is erecting 36 bank-type ovens at its plant on the Monongahela River between Brownsville and the LaBelle Coal & Coke Co.'s plant.

Cabin Creek Junction, W. Va.—The Virginian Power Co. through its secretary, Wilbur Tusch, is offering an issue of $1,250,000 of its notes, for the purpose of securing funds to complete its steam-power plant and transmission lines by which to handle the electric current which it will develop. The company is said to be constructing its steam plant with a view to developing 26,000 hp., which will be sold to mines in that section, of which there are 222 within transmission distance of the plant, producing more than 19,000,000 tons of coal annually. The company states that it has numerous contracts to furnish electricity to these mines. A future project to be developed by the company is a hydro-electric plant on the New River, which will require a 1400-ft. dam, 125 ft. in height, in order to develop 100,000 kw. Other power sites are controlled by the company on New River, and it contemplates ultimately to transmit electric current to several of the larger cities within a radius of several hundred miles of its plants.

NEW INCORPORATIONS

Williams, Okla.—W. T. Henry, G. T. Williams and S. H. Abbott have incorporated the Williams Coal Co. here, capital $1000.

Dallas, Tex.—An amendment has been filed by the Belknap Coal Co., of Wichita Falls, decreasing its capital stock from $200,000 to $150,000.

McAlester, Okla—The McAlester Coal Co. was recently incorporated here with J. G. Puterbaugh, C. H. Hightower and James T. O'Leary as incorporators.

Coalton, Okla.—The Herron Coal Mining Co., capital $20,000, has been incorporated with W. F. Herron, W. P. Russe and George Arbaugh as incorporators.

Seattle, Wash.—The McKay Coal Co. has been organize with a capital stock of $1,500,000. The incorporators ar Jos. J. Henry, Elmer C. Johnson and A. Welch.

Chicago, Ill.—The Scioto Collieries Co., with a capital o $50,000, has been organized to mine coal and manufactur coke. The incorporators are E. S. Cummings, T. J. Tarne an E. Colgan.

Richmond, Ind.—The Alley Monarch Mining Co. has bee incorporated here, with $50,000 capital stock, to do coal min ing. The directors are J. W. Alley, H. L. Monarch and Fre Hackman.

Charleston, W. Va.—The Laurel Hill Coal Co. has bee organized with a capital stock of $40,000, $5000 subscribe and $500 paid in, to do a coal-mining business in Lincol County. The incorporators are W. C. Walburn, J. H. Ma cum, M. L. Duncan, T. R. Walburn and J. A. Wood, all o Huntington.

INDUSTRIAL NEWS

Martinsburg, W. Va.—Several Martinsburg gentlemen headed by H. H. Emmert and W. A. Roush, have completed a deal for 1000 acres of land in Shelby and Fayette Counties Ill. An 8-ft. bed of coal runs through the property.

Johnson City, Ill.—The Link Belt Co., of Chicago, was re cently awarded the contract to put in the screens at the Lak Creek mine of the Consolidated Coal Co., of St. Louis. Thi mine has a tonnage now of 500 tons, getting out of the de velopment stage.

Wheeling, W. Va.—There will be a special meeting of th stockholders of the Wellsburg, Bethany & Washington R.R Co. on Nov. 12 in this city. This meeting is called for th purpose of considering the sale of valuable coal lands owne by the company.

Clarksburg, W. Va.—The Hutchinson Coal Co. has take over the holdings of the Short Line Coal Co., consisting of mine and 200 acres of coal at Dola, on the Short Line R.R between Clarksburg and New Martinsville. The new owner will put in a first-class mining plant.

Charleston, W. Va.—Awaiting a rise in the Ohio River 390 barges carrying 5,000,000 bu. of coal were assembled Oct 24 at the mouth of the Kanawha River ready to go through Lock 2 as soon as the stage should be sufficiently high to float them down to Cincinnati and Southern points.

Dubois, Penn.—The opening of traffic on the Pittsburgh & Shawnut R.R., between Kittanning and Brookville, was accomplished on Oct. 20, when the first train was run. This new road traverses a territory which has hitherto been dif ficult of access, but which is, nevertheless, thickly populated

Ebensburg, Penn.—Acting for others, A. W. Buck, of this place, purchased all the coal land, machinery, buildings and equipment of the Auld Run Coal Co. at forced sale. The coal lands lie in the Brushvalley district, in Indiana and Cambria Counties. It is understood that the mines will be reopened and operated on an extensive scale.

Connellsville, Penn.—John A. Bell and associates have purchased the property formerly owned by the Washington County Coal Co. lying in Jefferson Township, Washington County. This consists of about 800 acres of Pittsburgh coal and surface upon which the Cedar Grove mine was opened about five years ago. It is understood that necessary repairs will be made and the mine reopened shortly.

Reynoldsville, Penn.—A coal deal, which is regarded as one of the largest ever put through in Indiana County was practically consummated when the Manor Real Estate & Trust Co., of Philadelphia, secured the holdings of the Greenwich Coal & Coke Co., a tract of something over 27,000 acres in Green and Buffington Townships. The consideration is not known, but it is said that the figures will run well up into the hundreds of thousands of dollars.

Pittsburgh, Penn.—In September the Pennsylvania lines east of Pittsburgh and Erie carried 6,319,382 tons of coal and coke, an increase of 404,055 tons. Bituminous tonnage increased 471,873 tons, coke increased 54,338 tons, and anthracite decreased 122,156 tons. Coal and coke tonnage for nine months totaled 56,208,756 tons an increase of 5,125,517 tons. Bituminous tonnage increased 3,660,264 tons, coke increased 1,188,070 tons, and anthracite increased 277,183 tons.

COAL TRADE REVIEWS

GENERAL REVIEW

Market fails to show a further expansion. October busiess in anthracite below the average. Confusing cross curents and uncertainties in the bituminous situation. Market howing a softening tendency which is compensated for by ecreased shipments due to restricted car supply.

Despite important restraining influences, such as a reapse into unseasonable weather conditions, increasing conervatism in general business, and a continuation of the ecord-breaking movement of coal, there has been nothing more serious developed than a mild lull. Even this is rearded as more or less temporary, and is the inevitable acompaniment of a protracted between season's market; no urther expansion is anticipated until the trade definitely urns the corner and enters upon the winter's activity. On he other hand, uncompromising adherence to regular schedles is the rule with the leading producers and no element f infallation is perceptible at any of the large distributing enters.

In anthracite the mild weather is tending to hold down the emand, but a cold snap will soon create an active situation. Stove coal is in short supply, and is the feature of the market; aside from this there are quite a number of complaints about the poor business during October, which is ordinarily a big month in the hard-coal trade. Production has been curailed by an inadequate supply of cars, a rather unusual eature in anthracite at this period of the year.

The bituminous market is subject to confusing cross-curents and uncertainties. The situation at New York has firmed up to such a degree that an advance in quotations is necessary. On the other hand, New England reports a general ack of interest on the part of buyers with orders confined chiefly to extensions of previous sales. In spite of an inadequate car supply and a poor movement, there is plenty of coal at tide. In view of the fact that production is well covered by contracts it is thought that there is not sufficient free coal on the market to seriously effect the situation.

Decreased requirements in the iron and steel industry in he Pittsburgh district has curtailed the industrial consumpion, but retail demand has, on the other hand, been stimuated by the recent fall in temperature; while the general market is strong at the moment, it is generally felt that a certain weakness cannot be avoided when the lake shipping closes. Ohio continues reporting a consistently strong market, due probably to the acute situation in transportation. The new advanced price level is being firmly maintained with the tendency, if anything, toward a further increase.

The car shortage is also a controlling factor in the Midile Western situation, and there is a general feeling of uncertainty pending further developments. There is a brisk demand, while the lack of equipment is having a steadying nfluence, but the volume of business is not so large, and two or three weeks of mild weather will cause many cancellations.

BOSTON, MASS.

No material change in Pocahontas and New River. Transportation beginning to reach Hampton Roads with something like regularity. Georges Creek in light demand but the better Pennsylvania grades continue fairly firm. Stove size increasingly short and anthracite generally in firm position.

Bituminous—The mild situation of a week ago continues without material change. There is a general lack of interest here in Pocahontas and New River not only for spot shipment but for a month ahead and what orders come in are chiefly extensions of previous sales; $2.85 is frequently heard now as a price at which surplus tonnages are being moved at Hampton Roads and while some of the operating interests are able to command 5@10c. more the amount of the business is small and hardly significant. Transportation is just beginning to arrive with something like regularity.

New England, is taking things easily and nothing short of pinch conditions would stir up any active interest in Southern coals. Some large consumers are even seeking to have contract shipments postponed. The inland trade is well supplied and there is little inquiry; 130,000 tons arrived in Boston in one day last week.

From being the scarcest grade in the market, Georges Creek has lately come to tide in good supply and consumers are being urged to accept deliveries on contracts. So many consumers, however, had arranged for Pennsylvania when Georges Creek was not to be had that the outlets are now rather narrower than would have been supposed.

The Pennsylvania grades, especially, the quality coals, continue to show a firm undertone, with prices little changed. Most of the Cambrias and Somersets find a ready sale and the better coals from Clearfield may be included in the same list.

Anthracite—An increasing number of shippers are curtailing the proportion of stove size in any one cargo and notwithstanding frequent warnings many of the Eastern dealers have calmly taken on liberal supplies of egg and nut hoping for better shipments on stove as the season advanced. They now find themselves in a hard place, with stove almost as scarce as a year ago. The mild weather is holding down the demand at retail but given a cold snap there will be something of a strained situation. Stove is already commanding a premium f.o.b. with some of the individual shippers and there is likely to be more of the same talk as November comes along.

Quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.05@1.65	$1.30@1.75	$1.67@1.77	
Philadelphia*	2.30@2.90	2.55@3.00	2.92@3.02	
New York*	2.60@3.20	2.85@3.30	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@2.95
Providence†				3.73@3.88
Boston†				3.83@3.93

*F.o.b. †On cars.

NEW YORK

Cold snap of last week stimulated retail anthracite; wholesale continues moderately quiet, but with an excellent undertone. Bituminous improved and quotations advanced. Supplies at tide relatively low.

Anthracite—The warm weather continues to have a restraining influence upon the hard-coal situation, but the cold snap of last week had a stimulating effect on the retail businees, which is still in evidence. The market continues to be a weather proposition. But even as it is, the mines are working up to full capacity and the production is so heavy that there are reports of a car shortage at some points. An active situation is anticipated when the cold weather does appear.

Stove coal continues the leader in the market, and is in short supply at all points. Chestnut is improving and is moving much better, while egg is heavy. The steam sizes are being well taken care of. The better grades of No. 1 Buckwheat are in short supply and active with the poorer grades quiet. The good grades of No. 2 Buckwheat are still short, while No. 3 is easy on all kinds with the poorer qualities notably heavy.

We quote the local hard-coal market slightly higher as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	....	$4.95	
Egg	5.25	$5.15@5.25	5.20	$5.00@5.20
Stove	5.25	5.25@5.50	5.20	5.20@5.45
Chestnut	5.50	5.40@5.50	5.45	5.35@5.45
Pea	3.50	3.40@3.50	3.45	3.35@3.45
Buckwheat	2.75	2.60@2.75	2.45@2.70	2.00@2.70
Rice	2.25	2.25	1.95@2.20	1.75@2.20
Barley	1.75	1.75	1.70	1.50@1.70

Bituminous—A slightly stronger tone is noticeable in the local soft-coal market due probably to both interruptions of work in the mining regions and to transportation. Water shipments were seriously restricted for a time due to inclement weather, but the situation in this respect is much relieved at the moment. The stocks at tide are reported relatively small and there is the feeling that better prices are inevitable when the turn in the weather conditions is finally realized.

On the other hand, it is believed that the consuming interests are much better stocked than ordinarily; in fact, it is pointed out that the liberal stocking on the part of the railroads has been the cause of the market being so well maintained throughout the summer. The car supply continues moderately short, but it has not become any worse so far as can be seen.

In view of the improved condition in the market, we quote all grades somewhat higher this week as follows: West Virginia steam, $2.65@2.75; fair grades of Pennsylvania, $2.75@2.85; good grades of Pennsylvania, $2.85@2.95; best Miller Pennsylvania, $3.15@3.25; George's Creek, $3.20@3.30.

PHILADELPHIA, PENN.

Complaints of slow business in anthracite, as compared with previous years. Trade as a rule apathetic, but production heavy and the movement good. Broken coal out of the market.. Car shortage developing.

The weather is still the determining factor in the situation in this vicinity. The retail-market orders are coming in very slowly outside of the demand for stove coal. As a matter of fact, many dealers are complaining about the lack of business, and compared with previous years, October does not look as favorable. As a rule, this month usually sees a heavy business both with the wholesale and retail dealers; the apparent apathetic condition of the trade can be traced entirely to the unusual weather conditions, and no activity is looked for until there is a change in this respect.

Egg and chestnut coal still seem to be in easy supply; pea coal is picking up, but broken and stove are the only sizes for which there is an active demand. It is almost impossible to secure any tonnage of broken coal unless at the full circular price; this size is contracted for at the beginning of the season and many of the companies report that they are behind on deliveries, so that it is manifestly impossible for them to consider any additional business, even at the full circular prices.

One still hears of discontent due to the imposition of the state tax, but up to the present, no concentrated effort on the part of the retailers has been made to saddle it on the consumers; most of the dealers are still absorbing it.

Operations at the collieries has been much handicapped during the past week, with an unusual car shortage. This has been growing more acute weekly, and nearly reached a point during the past week, when it would prove more than serious.

Bituminous trade is about on a parity with the week previous. There were no unusual advances in prices and no reports except that all grades were holding their own, with the demand excellent, and production about equal to the call.

BALTIMORE, MD.

Weakening tendencies exhibited by the market. The Western demand showed a decline for the first time. Warmer weather conditions take away the prop of the previous week. Cars in rather poor supply.

The past week showed indications that the market would soon take a drop. Demand was the lightest for many weeks past, and despite a rather poor movement, due to restricted car supply, there was plenty of fuel at tide to meet all calls.

Concerns here with West Virginia connections reported that the rush of three-quarter gas coals toward the Great Lakes had slowed up to a considerable degree. Congestion at the shipping centers was given as a reason, and it is said that about all the fuel is now on hand that can be conveniently handled. A vast amount of coal is reported on cars at the lake ports. Fuels that had been bringing from $1.15@1.20 f.o.b. mines are now offering about 10c. off: Run-of-mine coal in West Virginia was offered down to the dollar mark, although most sales were above that figure.

Pennsylania steam coals are reported in poor demand, with railroad orders generally scarce. Sales are made around $1.20@1.25 that several weeks ago were bringing $1.35@1.40. It must be said, however, that there is not any great quantity of the coal not under contract, and the lull is probably more or less temporary.

As a whole the market is expected to pick up rapidly soon, unless there is a decided change for the worse in general industrial conditions. Warmer weather the past week undoubtedly took away the prop that had kept the market from a slump a week earlier.

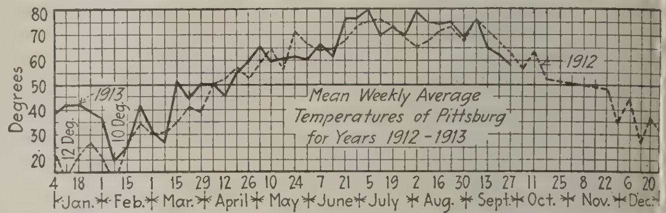
Anthracite conditions are normal, a fair call being noted for steam sizes, and the prospects being good for domestic coals when the first real winter weather appears.

PITTSBURGH, PENN.

Somewhat decreased industrial demand for coal, with increased demand for domestic, and occasional price advances in the latter. Car supply poor. Shipping stage in Ohio River permits dispatch of large fleets to down-river points. Connellsville coke market stagnant, with prices nominally unchanged.

Bituminous—There has been a considerable decrease in the fuel requirements of the iron and steel industry; in the past week or two there has been a decided slowing down and the prospect is clear for further curtailment of iron and steel output in the future. At present the mills are running at about 80% of capacity, but they are curtailing their supplies of all sorts in greater ratio, in view of the prospects.

Retail demand for coal, on the other hand, has increased, and some operators have made a further advance in 1¼-in. domestic, so that occasionally there are quotations above $1.75. A few have also marked up slack. Car supply continues poor. At the moment the coal market is fairly strong, but some decrease in strength can hardly be avoided when the Lake shipping season closes. We quote for prompt and near-forward delivery: Slack, $1@1.25; mine-run, $1.40@1.50; ¾-in., $1.50@1.60; 1¼-in. domestic, $1.65@1.75, per ton at mine, Pittsburgh district.



A rise in the rivers permitted shipments down the Ohio to begin Sunday, Oct. 26. On that day the Monongahela River Consolidated Coal & Coke Co. sent out six fleets of 22 barges each and three with 17 boats each, while the Diamond Coal & Coke Co. sent two fleets of 10 barges each, the total shipments amounting to about 33,866,000 bushels, or about 150,000 net tons, and additional shipments are being made as steamboats become available.

Connellsville Coke—The market continues altogether stagnant. There is no disposition to increase pig-iron production but rather to curtail somewhat. The operating furnaces are all covered by contracts and the disposition of operators is to overship, so that practically no demand comes into the market for prompt coke. No one is disposed to consider seriously the question of contracts for the new year. The market remains quotable: Prompt furnace, $2@2.15; contract furnace (nominal), $2.25@2.50; prompt foundry, $2.75@3; contract foundry, $2.75@3.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Oct. 17 at 379,605 tons, a decrease of 7285 tons, and shipments at 384,01[illegible] tons, a decrease of 5932 tons.

Later—The group of Connellsville coke operators who have been holding out for the $2.50 price on furnace coke have abandoned their efforts and will now meet the market. They have just sold 10,000 tons to an Eastern steel interest at $1.90 for November shipment, and the furnace coke market is now quotable on the basis of $2@2.15 for prompt or contract, with possibilities of a still further shading.

BUFFALO, N. Y.

Bituminous not so firm, but prices holding. Light demand due chiefly to warm weather. Coke continues weak. Anthracite affected by the lack of seasonable weather.

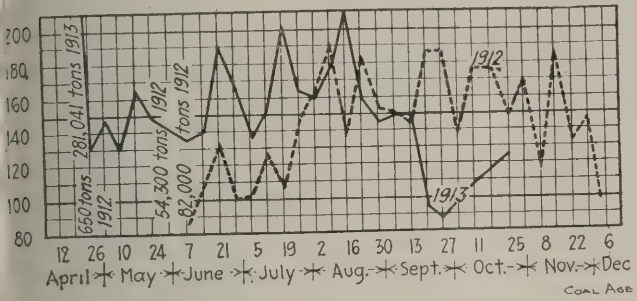
Bituminous—Soft coal is still on its former footing, but as a rule there is a report of general weakness everywhere, with prospects of a decline in prices if the weather continues mild. So far as can be learned the weakness is entirely on account of the weather. The reports of slackness now are not by any means general, but are more common than they were and must be accepted as not without meaning.

The car situation is without any change. The supply is smaller than ever before, not being more than 60 per cent of the demand on some of the leading coal roads. On the other hand, certain more local lines are providing cars promptly. The reports of strikes and lockouts increase, which, of course, offsets, in a measure, the alleged dullness in general business. There are said to be 800 miners on strike at Rossiter in the Clearfield district over the preparation of the coal and strikes and lockouts are reported in the Bessemer district, caused by the operators opposing the efforts of the men to unionize the mines. These difficulties are local, but they reduce the coal output while they last. The mine owner without coal enough to meet his contracts is not finding it easy to pick up extra tonnage.

Quotations on bituminous remain at $2.90 for Pittsburg lump, $2.80 for three-quarter, $2.65 for mine-run and $2.2[illegible] for slack, the latter being very firm; some jobbers say it will sell on a par with mine-run before long.

Coke—The coke market is weak, especially for low grades. While Connellsville 72-hr. foundry is fairly steady at $4.8[illegible], it is not easy to obtain $4.35 for 48-hr. furnace; stock coke is a drug, though it is not very plentiful.

Anthracite—The weather has been unfavorable in the an- acite trade also, but the movement is fair. Shippers are adily short of stove, while they have a surplus of egg. If stomers order straight stove or stove and chestnut they 1 the risk of being refused till they include about an even ount of egg. It is likely that the price of stove will event- tly be advanced to a par with chestnut.



ANTHRACITE SHIPMENTS FROM BUFFALO

The effort to accelerate the anthracite movement by lake only partially successful, as the mines are not producing fficient. The shipment from Buffalo by lake for the week as 125,400 tons, which is some hundreds of tons short of idsummer shipments. Still, with six weeks more before e lakes close, the supply at upper-lake ports ought to be least fairly satisfactory. The fleet has been held up con- derably of late by storms.

TOLEDO, OHIO

Cool weather stimulated domestic buying. Prices showing 1 upward tendency. Car shortage seriously interfering with roduction.

Coal is strengthening on this market, and the past week as noted some changes in the list, all with an upward trend. is generally believed that prices will be still higher. The cent cool weather has brought about a better domestic emand and the call for steam coal has been good all along. he car situation is tight with little prospect of an improve- ent for some time at least. There is a decided hold-up om southern Ohio coal fields, and this, of course, affects the ke shipping. Cargoes are not as heavy as is usual at this eason of the year for the reason that there is little or no oal on the docks which can be moved. The railroads are ading fully 50% hopper cars which are extremely objectionble to most of the trade, and whenever possible dealers are efusing to place orders in the hope that a little later flat- ottom cars can be obtained.

COLUMBUS, OHIO

New higher prices have been well maintained. Demand or all grades continues good and the production is limited nly by the car supply. Colder weather stimulates domestic rade.

The past week has been one of advancing prices and con- inued good demand in all the mining districts. The new evels announced a week ago have been well maintained and o price cutting of consequence is reported. In fact the tend- ncy is toward premiums rather than discounts and all in- erested in the trade believe that prices have not yet reached heir high point. Demand for domestic, steam and lake onnage continues strong.

Pressure in the retail trade has been largely responsible or advancing prices, as jobbers in every section are placing rders requesting immediate delivery. Stocks are generally ight and every effort is being made to increase them to ortify against a shortage when the severe weather comes. Dealers are getting higher prices than usual for the time f the year and the demand is running more and more oward the fancy grades such as Pocahontas and re-screened arieties.

The car supply is growing less and less and as a result the utput is being decreased. According to reports received rom all mining districts, Eastern Ohio only produced. 50 er cent. of the average and the Pomeroy Bend district howed up about the same. The Hocking Valley reports bout 55 per cent. of normal and the domestic fields are no etter.

Lake trade is active and will probably continue so as long s navigation is open. The tonnage is falling off but this is natural result of the increased domestic demand and the rowing car shortage. The larger operators which engage in he lake trade will probably ship a greater tonnage than last year. Congestion on the upper lake docks is not great and the interior movement is good.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump.....	$2.00 @ 1.90	....	$2.00 @ 1.90	$1.75 @ 1.70
3-4 inch............	1.85 @ 1.75	$1.50 @ 1.40	1.85 @ 1.75	1.55 @ 1.50
Nut...............	1.30 @ 1.20	....	1.60 @ 1.55	1.25 @ 1.20
Mine-run...........	1.50 @ 1.40	1.35 @ 1.30	1.50 @ 1.40	1.25 @ 1.20
Nut, pea and slack..	0.90 @ 0.85	....	1.00 @ 0.90	0.85 @ 0.80
Coarse slack........	0.80 @ 0.75	1.00 @ 0.95	0.90 @ 0.80	0.70 @ 0.65

DETROIT, MICH.

Bituminous steady after a slight reaction. End of month develops some business. Conditions not materially changed.

Bituminous—There has been little change in the local situation, and prices are being well maintained all along the line. There are unconfirmed reports of some producers seeking extra business who have made concessions in one way or another, but such business cannot be considered as the real market.

In the domestic market, smokeless coal is quiet. There seems to be a slight over-supply of this grade, and diversion and reconsignment of shipments to other points have ceased. This slowing down in business is giving the operators a welcome opportunity to increase shipments in the Lake trade from which there is a heavy demand. The semi-smokeless coals are bringing nearly Pocahontas prices; large stocks of these grades have been bought for domestic purposes, and now that Pocahontas is easier in the market, it is rather difficult to dispose of.

The market is now quotable on about the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump.	$1.65	....	....	....	....	$2.50	$2.50
Egg...........	1.65	....	....	....	....	2.50	2.50
Nut..........	1.50	....	....	....	....	....	....
Steam lump....	1.50	....	....	....	....	....	....
¾-in. lump......	1.15	$1.20	$1.15	1.10	1.10	....	....
Mine-run.......	1.10	1.10	1.10	1.10	1.10	....	....
Slack..........	0.85	0.85	0.75	0.75	0.75	....	0.85

Anthracite—Hard coal shows some briskness, due to a fall in temperature and the anxiety of dealers to accumulate an adequate supply before the winter's demand opens up. Jobbers, however, are not anticipating a very large business before the middle of the current month.

LOUISVILLE, KY.

Fall in temperature stimulated activity in the domestic grades. Steam coals also strong. Eastern Kentucky companies handicapped by poor car supply. Screenings weak.

Some rather snappy weather during the week past resulted in the usual flood of small orders which was reflected immediately to the mines and made business good on the prepared grades everywhere. The earliest snow in years fell through Kentucky on Oct. 21, and the number of small consumers who were caught unawares made things active for several days.

The steam market is also much stronger than a week or so ago, especially on eastern Kentucky coal. Prices are not especially high, considering the season, but the relatively limited supply of the better grades keeps the demand well balanced. About 80c. a ton f.o.b. mines is the average price, with second grades, including eastern and western Kentucky, from 15c. to 20c. lower.

A number of eastern Kentucky operators have lost about one-third time lately on account of the poor car supply, and it is extremely unlikely that this condition will improve as the season advances. Experience has proved to the contrary, and operators are, therefore, doing their best to prepare for a material shortage in transportation facilities.

As indicated, prices are improving all along the line. The November basis for eastern Kentucky coal is about $2.35 a ton for block, with isolated sales as high as $2.50 a ton, the second grades ranging from $2.10@2.25 a ton. The demand for western Kentucky domestic is also improving, block being strong at $1.25@1.40 a ton f.o.b. mines. There is little mine-run coal moving in any portion of the state.

HAMPTON ROADS, VA.

October will be a big month at the Hampton Roads piers. Shortage much easier than for some time. Domestic business beginning to open up. Rumors of a new big coal consolidation.

Shipments of coal over the piers at Hampton Roads continue brisk; large cargoes have moved coastwise and foreign, and the call for bunker coal has also been heavy. Present indications are that all piers will show up with a large tonnage dumped during the entire month, and unless the unforeseen happens the piers at Sewalls Point will again break their record. In addition to the movement of Pocahontas and

New River there has also been some shipping of high volatile and nut and slack coals to the New England market. Prices on all grades remain practically the same as they have been for the past two or three weeks.

There is a fair accumulation of coal at tidewater, and while some suppliers are short others have sufficient to take care of tonnage now due with some little free coal. Several large cargoes have been sold during the week and Government colliers have taken in the neighborhood of 30,000 tons in addition to the coastwise and foreign shipments. Vessels taking foreign cargoes have cleared for Havana, Santiago, Dakar, Trinidad, Cavite, St. Lucia, Canal Zone and Curacoa.

Reports are current here that negotiations have been closed by an English syndicate for the purchase of extensive coal properties in the New River fields of West Virginia. It is impossible, however, to get the report confirmed here. One of the largest companies mentioned as having been purchased have given out the statement that so far as they are concerned the report is without foundation.

Owing to the fall in temperature during the last few days retail business has picked up considerably although there is yet some complaint among the dealers as to poor sales. There has been no advance in prices for domestic grades, summer rates still prevailing.

BIRMINGHAM, ALA.

Demand for steam coal quiet, but domestic improving, due to the recent cool weather. Practically no furnace coke moving. Foundry coke quiet with sales limited to small shipments. Some improvement in blacksmith coal. Pig iron dull, though price is holding up well. Car shortage still evident.

The past week has brought no relief to the stagnant steam-coal market, the production being in excess of the demand, though none of the operators are making concessions in prices, believing this condition to be only temporary. Due to the recent cool weather, the domestic lump has taken on a more cheerful aspect, though the market is far from being satisfactory. Inquiries on blacksmith coal are increasing, and business on that grade is the most satisfactory of any.

There is practically no furnace coke moving out of this district, and foundry coke only in small quantities. Pig iron is very quiet, few sales being made during the past week, though at a better price than formerly, the basis being strictly $11.50 per ton on 2 Foundry for the balance of this year. Very little tonnage was booked for next year. While it would seem that the car supply would improve, with the quiet business, there is little change over last week. Some of the railroads are taking care of their mines fairly well, but those on the Southern Railway are suffering greatly for the lack of cars.

NEW ORLEANS

New coal transportation company announces big cut in prices. Completion of government work on Warrior River opens all water route for Alabama coal into this port.

While it has not been proved that coal can be brought to New Orleans from the Alabama fields by water at a cheaper rate than by rail, there is no question that the up-river Mississippi interests are worried. The formal announcement this week, by the president of the transportation company, which expects to handle this business through the Warrior, Tombigbee and Alabama Rivers, that coal would be sold in New Orleans 50c. under the present price, has caused something of a flurry.

The working out of the experiment is being watched with the greatest interest. It is suggested that this is the reason for the delay in the preparation for export business that could be brought to this port after the opening of the Panama Canal. There are seventeen locks to be passed in the Warrior River and whether the big self-propelled brages will be able to handle this business as cheaply as is expected remains to be seen.

INDIANAPOLIS

Notwithstanding mild weather, domestic trade continues good. The call for screenings not yet back to normal. Complaint about the car situation continues. Mine operations are cut down. There is little heavy demand, however, among consumers, on account of this situation.

The little spurt of cold weather was helpful to the coal trade, especially the retail department, but it has been succeeded by another mild spell. The short car supply is a large factor in the trade, yet the situation does not seem to differ much from that existing any year at this time. It is true, however, that it is affecting mine operations to the extent of about 30% in this state.

The screening situation does not improve much, and operators are puzzled as to why it does not get back to normal. Industrial conditions in the state seem to be about as active as usual and the mild weather is not regarded as a weighty factor. It is believed by some that the large Chicago agencies are buying at outside points to give the Indiana mines the impression that they are not in the market. The domestic situation is strong. Supplies of Eastern coal are slow to arrive, but this is not causing distress yet as yard stocks seem to be of good size. In fact, if the mild weather keeps up two or three weeks, there will be many cancellations of orders. The following range reflects Indiana prices f.o.b. mines:

Mine run No. 4	$1.10@$1.35	Domestic lump No. 5 & 6	$1.50@ 1.75
Mine-run No. 5 and 6	1.05@ 1.10	Screenings No. 4	0.60@ 0.90
Nut	1.25@ 1.35	Screenings No. 5 & 6	0.50@ 0.60
Egg	1.40@ 1.60	Brazil block	2.00@ 2.25
Domestic lump, No. 4	1.75@ 2.00	Washed coal at premium of 25c. a ton	

The chief trouble now is in the car shortage due, apparently, to the lack of motive power. A committee of operators sent a communication to the commission stating that in more than 200 instances, coal equipment had been held for weeks in Indianapolis yards while the mines were suffering for cars, also that 350 carloads of coal are on track in this city almost every day and there is no power to move them. The commission learned that the New York Central and Pennsylvania companies are contemplating a belt line around the city, which would eliminate the congestion of freight traffic.

CHICAGO

Demand continues brisk, but sales are somewhat less than customary for this time of the year. Shrinkage in the car supply has tightened the market on Eastern coals. Demand for gas-house and byproduct coke materially increased. Carterville operators report heavy buying of all sizes. Heavier sales of anthracite.

While the demand for coal in the Chicago market continues brisk, the general volume of business is somewhat under the records for October in previous years. A shrinkage in the car supply is the chief factor in the Eastern coals in this market. The position of the smokeless grades, especially, has been strengthened on this account. There has been a distinct revival in the buying of this coal and a previous wavering tendency in the market has disappeared.

A greater demand in the Western market and a lessening in the supply of freight equipment has caused the additional strength noted in the anthracite trade. Chestnut continues to be short of the demand. It is estimated that Eastern operators are obtaining about one-half the cars they need and that the supply for Western producers ranges between 60 and 75%.

Small shipments of Hocking coal has created an unsatisfactory condition in this section, and the supply falls short of demand by a substantial margin. Additional firmness is reported in the coke market. There has been a marked increase in orders for gas-house coke and the byproduct variety is in greater demand. The latter now sells at from $4.90@5.10. Similar strength is lacking so far as furnace and foundry coke are concerned. The recent announcement of E. H. Gary, chairman of the board of directors of the United States Steel Corporation, that there will be no shutdown of the mills at Gary, Ind., however, has given operators increased confidence in the future.

A strong demand for all sizes of Carterville coal has been reported by operators in that district. Domestic lump and No. 1 washed sell, as a rule, at $2 a ton, the mines. A considerable amount of egg is being sold at high figures for retail consumption. In the territory surrounding Franklin County, domestic lump is selling at from $2@2.25, the mines, while in districts farther distant prices are somewhat under these figures. Springfield operators have failed in their effort to boost the price of domestic lump to $2, and it is now firm at $1.75.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.57	$3.05@3.30	$2.52	
Steam lump	2.07		2.07	
Egg		3.05@3.30		$4.30@4.45
Mine-run	1.92	2.40@2.55	1.87	3.45@3.55
Screenings	1.12@1.22	1.55@1.80	1.12@1.22	

Coke—Connellsville, $5.50; Wise County, $5.25@5.50; byproduct, egg and stove, $4.90@5; byproduct, nut, $4.95@5.10; gas house, $4.65@4.75.

ST. LOUIS, MO.

Market uncertain pending further developments. Car shortage having a steadying effect. Anthracite moderately active. Steam coals heavy.

An unsteady market for the past week has kept the trade in a somewhat uncertain channel, expecting that every day would bring something to base future prospects on. The weather has been mild and the anticipated demand and advance in price did not come.

Che only thing that stimulated the market at all was the shortage, which became more pronounced the past week, has a somewhat serious aspect now. On the Illinois Cen- the mines are now getting about two or two and a half s per week, the C. & E. I. about three days a week, and Iron Mountain about the same. The roads from the inner ls are in somewhat the same trouble, the Southern giving mines about two days a week, the L. & N. about three, the & O. four, and the Vandalia five. The Wabash is in pers the worst condition of all, for what little equipment they e is usually in bad order.

There has been a fair demand the last week or so for anacite, especially in the larger sizes. Gas-house coke is in some demand but byproduct is a drug. Smokeless is ving better than was anticipated. The local steam market still dragging and Standard coal when averaged up is ely bringing the cost of production.

The prevailing prices are:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
. lump	....	....	....	$1.10@1.20
. lump	....	....	$1.50	....
. lump	$1.75 @ 2.00	....	1.60	1.40@1.50
np and egg	1.50 @ 1.60	$2.25	....	....
. 1 nut	1.50 @ 1.75	....	....	1.10
eenings	0.50 @ 0.60	....	....	0.20@0.25
ne-run	1.10 @ 1.20	....	....	0.90

. 5 washed nut	0.35 @ 0.40	....	....	....

KANSAS CITY, MO.

Weather conditions favorable. Gas supply still limited. ll-time operations general.

A sudden drop of the thermometer was responsible for a sh during the past week. Though the cold weather was ort lived, people who had about made up their minds to get ong with gas during the coming winter promptly decided at a change of attitude was necessary. Practically all dered coal and indications are that demand will continue rong during the next few months.

Many plans have been advanced to increase the available pply of natural gas here, but none is regarded as practicle. Officers of the piping company assert that the supply is stricted, and the coal situation is being benefited to a arked extent. All mines are working full time with the ception of a few which close down occasionally because the shortage of transportation facilities.

OGDEN, UTAH

Warmer weather throughout territory has affected shipents. Shortage of coal in Colorado has absorbed surplus at ock Springs. Car shortage in Wyoming continues, but sitution in Utah has improved. Quotations advanced in southern alifornia, Nebraska and Colorado.

The entire intermountain territory has been enjoying ideal ll weather and the demand for coal has slacked off somehat. However, the mines still have plenty of lump orders to eep running at capacity. The sugar factories and other eam plants are consuming all the slack and steam coal prouced at the mines. At the first of this week there were inications of a surplus of nut coal at the Wyoming operations, ut the unusual demand in Nebraska and Colorado allowed e operators to move a larger percentage of this grade into e Eastern market.

A partial car shortage continues in Wyoming, and most the mines are losing some time on this account. It seems ere are plenty of box cars, but open cars for loading slack re very scarce. The conditions in Colorado has assisted the tah mines, which at present are working full time.

Quotations for southern California have advanced to: ump, $3; nut, $2.50; mine-run, $1.85; slack, $1. Shipments to ebraska and Colorado are above normal and quotations are ow: Lump, $3; nut, $2.25; mine-run, $1.85; slack, $1. The alance of the territory remains at: Lump, $2.75; nut, $2.25; ine-run, $1.85; slack, $1.

PRODUCTION AND TRANSPORTATION STATISTICS

THE CAR SITUATION

American Ry. Association reports surpluses and shortages f coal equipment for two weeks ended Oct. 15, as follows:

	Surplus	Shortage	Net*
New England Lines	86	0	**86**

Coal Age

NORFOLK & WESTERN R.R.

The following is a statement of tonnages shipped over this road from mines in West Virginia and the commercial and company coal, for the month of September, in short tons:

Field	Shipped	Tipple	Total	Commercial	Company
Pocahontas	1,216,933	17,144	1,234,077	1,261,363	89,380
Tug River	231,318	3,688	255,045	192,449	42,557
Thacker	225,733	11,054	233,756	165,524	71,242
Kenova	73,090	9,589	82,679	64,860	17,819
Clinch Valley	....	....	....	146,306	15,200
Other N. & W.	....	....	....	4,698	....
Total N. & W. Fields				1,835,200	236,198
Williamson and Pond Crk. RR.	....	....	....	37,609	5,167
All Other Railroads	....	....	....	200,704	....
Grand Total	1,747,073	41,455	1,788,523	2,073,513	241,365

Shipments of coke entirely from the Pocahontas field amounted to 99,256 tons.

BALTIMORE & OHIO

The following is a comparative statement of the coal and coke movement over this road for September and the first eight months of this year and last year:

	September		Nine Months	
	1913	1912	1913	1912
Coal	3,001,733	2,784,230	25,901,547	23,372,470
Coke	387,704	386,335	3,619,076	3,449,574
Total	3,389,437	3,170,565	29,520,623	26,822,044

VIRGINIAN RAILWAY

Total shipments of coal over this road for September of the current year were 393,199 tons as compared with 276,851 tons for the same month last year. For the nine months to Sept. 30 of the current year, the shipments were 3,291,941 tons as compared with 2,522,221 tons for the same period last year, showing a substantial increase.

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for September and first nine months of this year and last year in short tons:

	September		Nine Months	
	1913	1912	1913	1912
Anthracite	813,394	935,550	7,665,020	7,387,837
Bituminous	4,378,037	3,906,164	37,774,323	34,114,059
Coke	1,127,951	1,073,613	10,859,413	9,671,343
Total	6,319,382	55,915,3 7	26'298,756	51,173,239

IMPORTS AND EXPORTS

The following is a comparative statement of imports and exports in the United States for August, 1912-13, and for the eight months ending August, 1911-12-13, in long tons:

	8 Months			August	
Imports from:	1911	1912	1913	1912	1913
United Kingdom	5,881	5,881	3,693	1,143	229
Canada	686,984	916,453	746,029	150,472	67,418
Japan	9,271	18,616	70,229	400	6,564
Australia and Tasmania	142,684	84,554	96,651	3,969	19,017

Total, 12 months			206,381,392	

[1] Includes coal from connecting lines.

[2] Includes company's coal.

[3] Does not include company's coal hauled free.

Note.—Southern Railway handled 338,648 short tons of coal during July and 2,409,598 short tons during the 7 months ending July.

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for July and the first seven months of the years 1912 and 1913:

State	July		Seven Months	
	1912	1913	1912	1913
Missouri	176,125	198,723	1,666,270	1,620,257
Kansas	337,367	465,761	2,794,914	3,134,125
Arkansas	126,224	163,185	1,033,059	1,026,101
Oklahoma	201,959	272,124	1,582,189	1,935,973
Totals	841,675	1,099,793	7,076,432	7,716,456

FOREIGN MARKETS

GREAT BRITAIN

Oct. 17—There is practically no change in the conditio the coal market. Admiralty list descriptions continue good request for prompt shipment, but inferior classes large are plentiful. Best small coals are steady. Forw business is slow, buyers generally adopting a waiting po Quotations are approximately as follows:

Best Welsh steam	$4.68@4.80	Best Monmouthshires	$3.96@
Best seconds	4.44@4.56	Seconds	3.72@
Seconds	4.20@4.32	Best Cardiff smalls	2.46@
Best dry coals	4.32@4.56	Seconds	2.28@

The prices for Cardiff coals are f.o.b. Cardiff, Penarth Barry, while those for Monmouthshire descriptions are f Newport; both net, exclusive of wharfage, and for cash 30 days.

NOTES IN THE FOREIGN TRADE

The following excerpts are taken from the "D Consular and Trade Reports:"

Coal in the Klondike—The Northern Light, Power & Co., of Dawson, shipped 10 tons of coal to Fairbanks, Ala in mid-August from its mines at Coal Creek, which is the Alaska-Canadian line on the Canadian side. The Fingers Coal Co., whose mines are about midway betw Dawson and Whitehorse, on the Yukon River, in Yu Territory, is selling coal in Dawson at $14 per ton. though a higher grade of coal than that of the other c pany, it contains a lower per cent. of pitch and forms m or less clinkers in burning.

The Elbe River Markets (Germany)—The lignite indu enjoyed a good business in 1912. Sales were greater t in 1910 and 1911, and were encouraged by the early wi general activity in oil-consuming industries, and the mal sugar campaign. Labor conditions were satisfact Bohemian lignite importation was furthered by the g shipping facilities on the Elbe.

Guadeloupe (French West Indies)—Total coal imp into this country for 1912 amounted to 29,124 tons as c pared with 39,459 tons in 1911; of this amount the Un States furnished 25,881 tons in 1912, and 13,049 tons 1911.

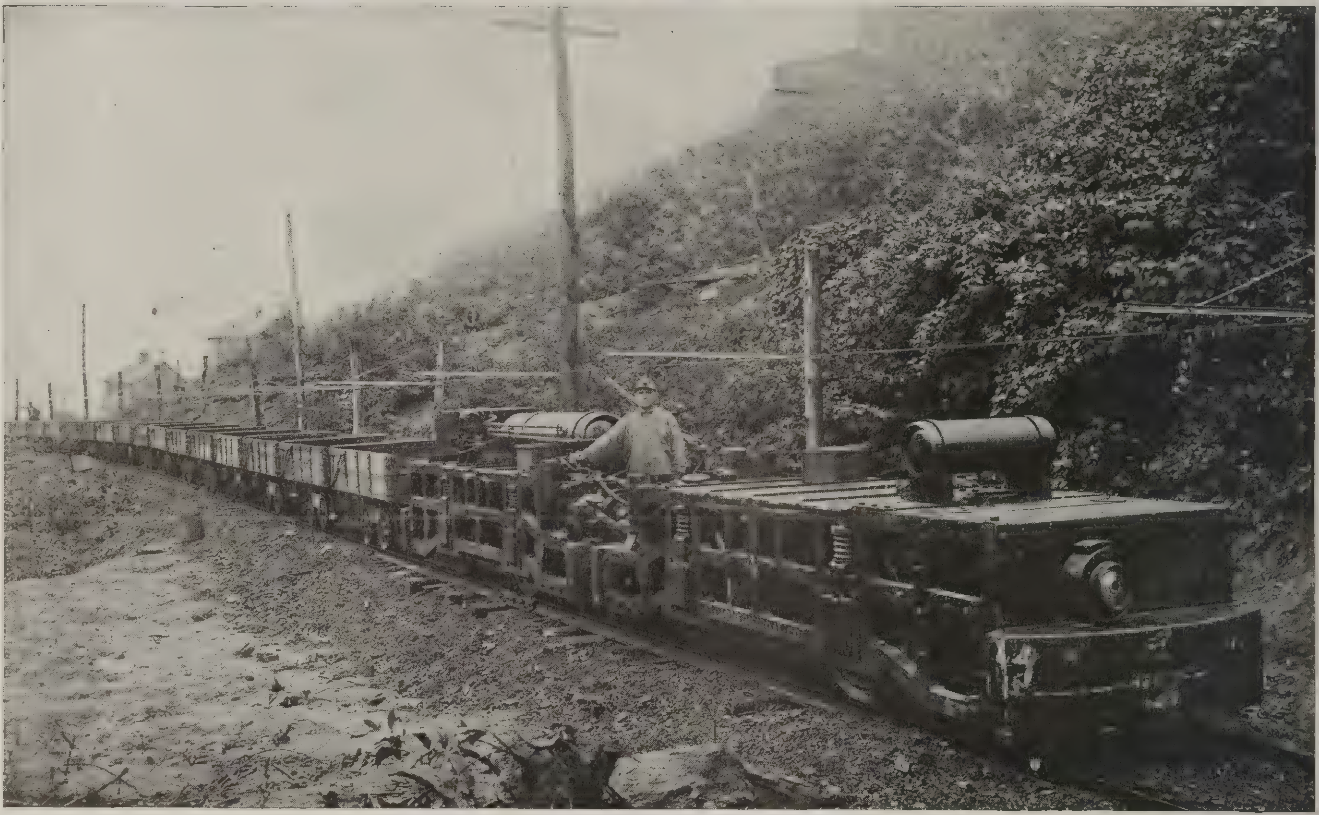
MADISON COAL CORPORATION'S SURFACE PLANT AT MINE No. 9, DEWMAINE, ILL.



Two Units in Tandem, used as a 30-Ton Locomotive.

The Largest Mine Locomotive That Has Ever Been Built

was recently installed at the mines of the Charleroi, Pa., Coal Works. This locomotive (*Baldwin-Westinghouse Barsteel type*) weighs 30 tons, and, it is estimated, can haul 100 cars, each loaded with three tons of coal, over the local grades, which are two miles long and largely against the load.

The locomotive consists of two units which can be separated and used as 15 ton locomotives if desired.

The use of two units in tandem distributes the weight over 8 wheels instead of 4, and hence the locomotive has great tractive power and also is easier on the track than if the weight were more concentrated.

The **Barsteel** frame construction gives ready access for inspecting, oiling, replacing brake shoes, adjusting brake rigging, etc., and also allows excellent ventilation to the electrical apparatus.

If you want to get out maximum tonnage at the least expense and in the shortest time ask for the advice of our mining experts.

One Unit, used as a 15-Ton Locomotive.

VOLUME 4 NOVEMBER 8, 1913 NUMBER 19

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 685

A poem entitled "The Boys of the Rescue Crew." The verses are complimentary to the brave men who have dedicated some of their time and service to "first-aid" work at our coal mines. Berton Braley. COAL AGE, Vol. 4.

*MINING NATURAL COAL AND COKE IN VIRGINIA: *Pages* 686-687

Description of mining a seam of natural coke in conjunction with three other contiguous seams of coal at Richmond, Va. These seams have a dip varying from 18 to 45 deg.; the two middle ones are worked together, being separated by only 5 or 6 ft. of parting. Most of the chutes are worked on the battery system, but a few light pitches require sheet iron to make the coal slide down to the gangway.

*THE BRUSH CREEK COAL FIELD IN KENTUCKY: *Pages* 687-688

A brief sketch of the development of the Brush Creek field in Kentucky. Production is relatively small as yet, but the coal is of a popular grade and the indications point to a rapid increase. John C. McNeil. COAL AGE, Vol. 4.

*A CHINESE COAL CABLEWAY: *Pages* 688-690

A modern aèrial tramway supplanting a continuous caravan of camels and pack mules. Mining is, however, still carried on by the peasants in the most primitive manner, each man or family working independently and employing antiquated hand methods. A. Gradenwitz. COAL AGE, Vol. 4.

A PLEDGE TO SAFETY FIRST: *Page* 690

COAL MINING IN CHINA, 1912: *Page* 690

RELATION OF BIG BUSINESS TO MINING: *Pages* 691-695

It is suggested that there be an interstate trade commission and state trade commissions, which shall have substantially the same powers to regulate coöperation in industry that the Interstate Commerce Commission and the State Commerce Commission have in regard to the public utilities. Charles Richard Van Hise. COAL AGE, Vol. 4.

EXAMINATION QUESTIONS WITH ANSWERS: *Page* 711

COAL AND COKE NEWS: *Pages* 712-715

SNAPSHOTS IN COAL MINING: *Page* 696

Miscellaneous views of surface and underground equipment, gathered from all parts of the world.

LEGAL DEPARTMENT: *Page* 697

PLACE FOR DELIVERY OF COAL:
Silence in contracts to sell coal as to where delivery shall be made frequently leads to litigation. Trade custom or surrounding circumstances sometimes supply omission. Judicial construction placed upon particular words and phrases which have been used in coal-sales contracts. Review of cases passed upon by the appellate courts. A. L. H. Street. COAL AGE, Vol. 4.

POWER DEPARTMENT: *Pages* 698-701

*A CENTRAL STATION IN WESTERN KENTUCKY:
The utilization of the exhaust steam from three air compressors for the generation of 500 kw. of alternating current. A considerable proportion of the power required for three mines is thus made from a waste product formerly thrown away. Newell G. Alford. COAL AGE, Vol. 4.

*AN IDENTIFICATION CHECK-BOARD: *Page* 702

THE EVANS MINING CLASS: *Page* 702

EDITORIALS: *Pages* 703-704

Where Responsibility Is Lacking—Labor Leaders Sentenced to Prison—The Mine-Cave Problem.

SOCIOLOGICAL DEPARTMENT: *Pages* 705-707

Technical and Industrial Education—The Panther Valley Mining Institute—A Motor Ambulance for Colliery First Aid—Lackawanna Steel Co.'s Contest—D. L. & W. First-Aid Meet.

DISCUSSION BY READERS: *Pages* 708-710

Collapsible Stoppings. Letter No. 8—Starting Fan after Explosion. Letter No. 7—The Safety Lamp and the Eyesight—To Prevent Gas and Dust Explosions—The Certificate Law.

STUDY COURSE IN COAL MINING: *Page* 710

COAL TRADE REVIEWS: *Pages* 716-720

ADVERTISING INDEX: *Page* 24

The Weekly Ad-Talk Page

There was a book published not long ago that made such an impression on an advertising man of Chicago that he decided to advertise it at his own expense. He said that it was a book he had waited for so long and so ardently that he felt he must tell other people about it—induce other people to read it.

The book is called "CROWDS." Its author is Gerald Stanley Lee. And the book might be called a philosophy of modern business. It claims the world is waking up to the fact that the Golden Rule is practical, every day common sense.

Here is an interesting extract from "Crowds" which will give you an idea of its quality:

"In the United States some forty years ago, being a new country, and being a country where everything a man did was, in the nature of things, felt to be a first experiment, everybody felt democratic and independent, and as if he were making the laws of the universe just for himself as he went along.

There was a period of ten years or so in which every spool of thread and bit of dress goods—everything that people wore on their bodies or put in their mouths, and everything that they read, came up and had to be considered as an original first proposition, as if there never had been a spool of thread before, as if each bit of dress goods was, or was capable of being, a new fresh experiment, with an adventurous price on it; and before we knew it a moral nagging and edging and hitching had set in, and was fast becoming in America an American trait, and fixing itself by daily repetition upon the imagination of the people.

The shopping of a country is, on the whole, from a psychologist's point of view, the most spiritual energy, the most irrevocable, most implacable meter there can ever be of the religion a country really has.

There was no clergyman in America who could have made the slightest impression on this great national list or trend of always getting things for less than they were worth—this rut of never doing as one would be done by. What was there that could be done with an obstinate, pervasive, unceasing habit of the people like this?

What was there that could be done to touch the imagination of the crowd?

Six thousand women a day were going in and out of A. T. Stewart's great store on Broadway at that time. A. T. Stewart announced to New York suddenly in huge letters one day, that from that day forward there would be one price for everything sold in his store, and that that price would be paid for it by everybody.

A. T. Stewart's store was the largest, most successful, original, and most closely watched store in America.

The six thousand women became one thousand.

Then two thousand. Some of them had found that they finished their shopping sooner; the better class of women, those whose time was worth the most, and whose custom was the largest, gradually found they did not want to shop anywhere else. The two thousand became three thousand, four thousand, six thousand, ten thousand, twelve thousand.

Other department stores wanted the twelve thousand to come to them. They announced the one price.

Hardware stores did it. Groceries announced one price. Then everybody.

Not all the clergymen in America, preaching every Sunday for months, could have done very much in the way of seriously touching the imagination of the crowd on the moral unworthiness, the intellectual degradation, the national danger of picking out the one thing that nearly all the people all do, and had to do, all day, every day, and making that thing mean, incompetent and small. No one had thought out what it would lead to, and how monstrous and absurd it was and would always be to have a nation have all its people taking every little thing all day, every day, all they were buying, or that they were selling—taking a spool of thread, for instance—and packing it, or packing their action with it, as full of adulterated motives and of fresh and original ways of not doing as they would be done by as they could think up—a little innocent spool of thread—wrecking all their sins and kinds of sins on it, breaking every one of the ten commandments on it as an offering. * * *

It was A. T. Stewart, a very ordinary-looking, practical man in a plain, every-day business, who arrested the attention of a nation and changed the habit of thought and trend of mind of a great people, and made a candid, direct people, a people that went with great sunny prairies and high mountains, a yea and nay people, straightforward, and free from palavering forever. A. T. Stewart was accustomed in his own personal dealings from day to day to cut people short when they tried to heckle with him. He liked to take things for granted, drive through to the point, and go on to the next one. This might have ended, of course, in a kind of cul de sac of being a merely personal trait in a clean-cut, manful, straightforward American gentleman; and if Stewart had been a snob or a Puritan, or had felt superior, or if he had thought other people—the great crowds of them who flocked through his store—could never expect to be as good as he was, nothing would ever have come of it.

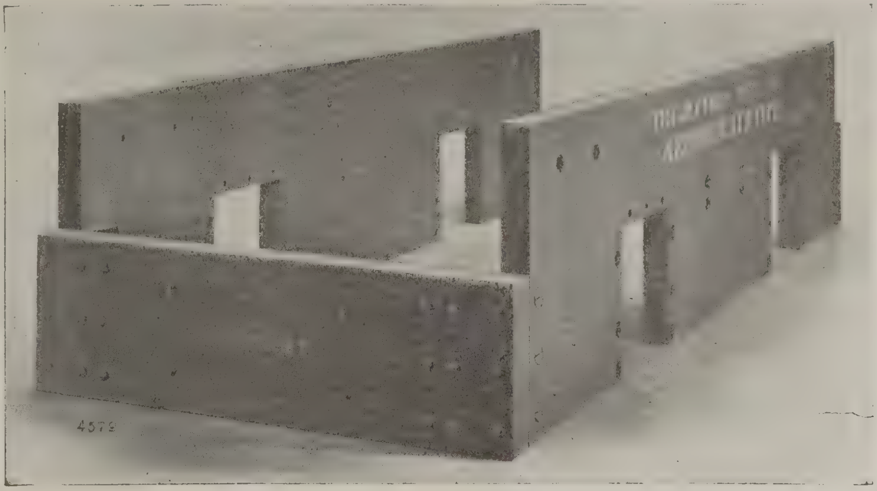
It is not likely that he was conscious of the long train of spiritual results he had set in motion; of the way he had taken the habit of mind, the daily, hourly psychology of a great people, and had wrought it through with his own spirit; or of the way he saved up, and set where it could be used, everyday religion in America, and had freed the business genius of a nation for its most characteristic and most effective self-expression.

He merely was conscious that he could not endure palavering in doing business himself, and that he would not submit to being obliged to endure it, and he believed millions of people in American were as clean-cut and straightforward as he was.

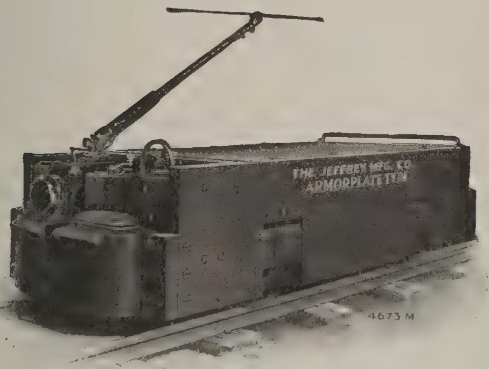
And the millions of people stood by him."

You Realize the Advantages of the

Jeffrey *ARMORPLATE* Type Locomotive



The *ARMORPLATE* Frame allows the greatest per cent. of weight to be used for motor equipment for a given weight of locomotive.



The *ARMORPLATE* Type of Frame is used on Locomotives from 7 tons up to and including 15 tons weight.

The solid rolled steel slabs are practically indestructible, insuring rigidity and long wear; greater protection to motorman and equipment than any other type of frame in use.

The cost of upkeep for this construction is a minimum.

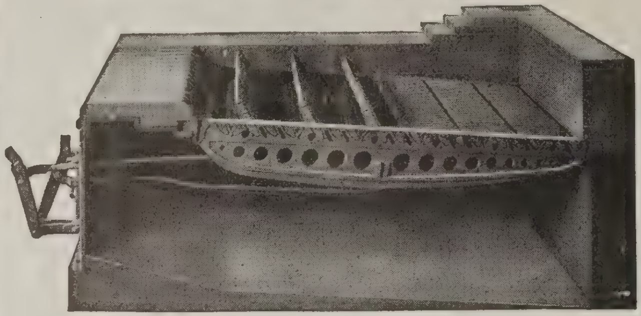
"Burn That Coal; Don't Waste It"

There's a lot of coal taken out of your shafts that simply piles up as "waste." It's too fine to be shipped—too low grade to be **sold**—and you think no doubt that it can't be **burned** to any advantage.

But you **can** burn that so-called "waste" stuff—and get out of it all the steam necessary for your power plant, if you will use



McClave Grate No. 4-A installed complete. Illustration shows divided cut-off position

McClave Grates

McClave Grates, used in combination with **Argand blowers**, get out of low grade fuels such as buckwheat, rice, slack, bird's eye, etc., results practically the same as with first class coal. They're built for that purpose. And for YOU, think what a saving that means. You can sell **all** the high grade coal you mine. Why not do it?

Catalog "H" tells about the McClave-Argand combination. Write us for it—NOW.

Send For This Book

It tells how you can successfully screen and "pick" your coal *in one operation.*

It describes in detail

The "MARCUS Patent Picking Table Screen"

Tells where and how it is being used both abroad and in this country.

Why it requires hardly 50 per cent. of the power formerly required to do the same work.

Why it results in a better sized and cleaner coal.

It is, in short, a booklet genuinely worth sending for—if you are interested in any way in the economical screening and cleaning of coal.

COAL AGE

Vol. 4 NEW YORK, NOVEMBER 8, 1913 No. 19

The Boys of the Rescue Crew

BY BERTON BRALEY

Written expressly for Coal Age

When the damp explodes in a distant room
Or the roof of an entry falls,
Sealing the men in a living tomb
With thick and soundless walls;
When the women crowd at the open shaft
And wail as the women do,
It's then we call for the nerve and craft
Of the boys of the Rescue Crew!

They take the smoke
As a sort of joke,
They dare the fire damp, too:
For it's all their trade
And they're not afraid,
The boys of the Rescue Crew!

They look like divers who tempt the sea,
But they battle with fire instead,
To bring out the living—if such there be—
And search for the huddled dead;
And many's the seething hell they've braved
For the sake of their comrades there,
And many a dying man they've saved
And brought to the light and air!

By day or night
It's theirs to fight
With death itself in view,
And they face their fate,
With hearts elate,
The boys of the Rescue Crew!

There's blame few medals they ever get
And never a hint of fame,
But the miners know their style, you bet
And the way they play the game;
The words of the miners are few and rough
But their thanks and their faith are true,
And the prayers of the women are fame enough
For the boys of the Rescue Crew!

In the heat and murk
They do their work
And they stick till the work is through,
So I boost again
For those dauntless men,
The boys of the Rescue Crew!

Mining Natural Coke and Coal in Virginia

By John E. Ambrose*

SYNOPSIS—Description of mining a seam of natural coke in conjunction with three other contiguous seams of coal, at Richmond, Va. These seams have a dip varying from 18 to 45 deg.; the two middle ones are worked together, being separated by only 5 or 6 ft. of parting. Most of the chutes are worked on the battery system, but a few light pitches require sheet iron, to make the coal slide down to the gangway.

⁂

One of the most interesting studies from a geological standpoint is the formation of the natural coke of the Richmond Basin, Va. Some years ago, before the civil war, the mines at Gayton, Henrico County, Va., were operated by slaves, worked by their masters. Slopes were sunk to great depths, and headings or gangways, as we call them in pitching seams, were driven long distances without any aircourses. The mines made fair outputs. The rooms (breasts) were turned directly off the gangways or levels, which were driven at right angles to the slope and about 100 ft. apart. The coal and coke were trammed to the slope turnout or sidetrack where they were hoisted to the surface.

For some reason, the mines were shut down, later, and allowed to fill with water. A few years ago a company was formed, the water pumped out of the shafts on the upper end of the property and operations commenced on a large scale. This company continued to develop the property until their tipple burned down, when they ceased operations and allowed the slopes and shafts to again fill with water. Recently the Old Dominion Development Co., of Richmond, Va., pumped the water out of the slope opening, which is about 1580 ft. deep, retimbered the slope, relaid the incline with heavy steel rails and, for the third time, active mining operations were resumed in this mine.

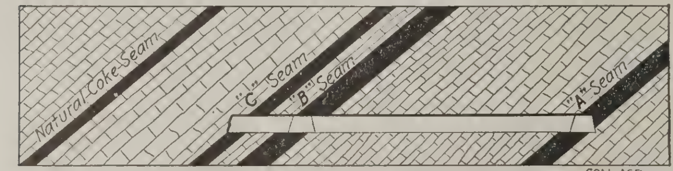

Fig. 1. Cross-Section of Coal Measures, Showing the Cross-Tunnel to Reach Other Seams

The system recently adopted for the operation of the mine may be described as follows: The main hoisting slope is a single-track incline, pitching about 40 deg. at the entrance, and is driven through the overlying strata to intersect the seam, a distance of about 150 ft. Below this point, the slope is driven in the seam on a dip of about 18 deg., until the 1000-ft. level is reached. From that level the seam pitches from 35 to 45 deg., until it reaches the foot of the slope or the 1580-ft. level.

There are three seams of coal besides a natural coke seam. As shown in Fig. 1, the foot of the slope is located in the "A" seam, and from this point a double-track tunnel, Fig. 2, is driven across the measures to intersect the "B" and "C" seams, and will be extended later to tap the coke seam beyond. At the point where the tunnel intersects the "B" seam, gangways are turned north and south, in that seam. These gangways are timbered with heavy double timbers, the collars being 7 ft. between notches and 7 ft. in the clear above the rail, while the legs have a 10-ft. spread.

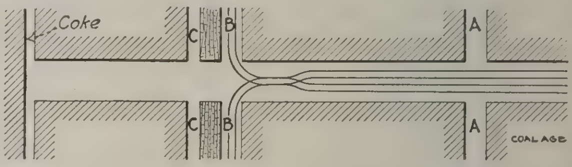

Fig. 2. Plan of Slope Bottom, Showing Arrangement of Tracks

The strata between the "A" seam and the "B" seam vary from 96 to 110 ft. in thickness, while the parting between the "B" and "C" seams is only 5 to 8 ft. thick. From the "C" seam to the natural coke seam, the thickness of the strata varies from a few feet on the south end of the property to 150 and 200 ft. on the north end; although some claim that the "C" seam and the coke seam come together on the north end of the property where the "C" seam is cut out entirely.

The gangways were driven in the "B" seam, because of the fact that only a few feet of slate separated it from the "C" seam. It was found that by working these two seams, room over room and pillar over pillar, the coal could be successfully taken out; but it was necessary to keep the workings in the "C" seam ahead of those in the lower or "B" seam. No gangways or levels were driven in the "C" seam; but, instead, rock chutes were driven up from the "B" seam and the coal in "C" seam was mined through these chutes, as shown in Fig. 3.

Later, however, the gangways were turned from the "B" seam into the "C" seam, as the coal in the latter was found to be of an excellent grade, more or less resembling anthracite. The thickness of this seam varied from 5 to 6 ft. An aircourse was driven in the upper "C" seam and the rooms in that seam turned off the aircourse. Where the pitch was light, it was necessary to lay sheet iron in the chutes to enable the coal to slide down to the level or gangway; but where the pitch was heavier, the battery method was used, the chutes being kept full of coal and the miners standing on the coal at the face while at work.

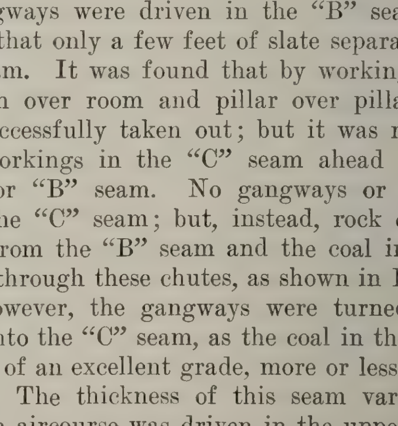

Fig. 3. Cross-Section Showing Workings in "B" and "C" Seams

The development work, as far as it has progressed, shows that the coke seam is thicker at the north end of the property than at the south end. The writer is informed by old miners that this coke seam attains a thickness of 6 to 10 ft. in places. The coal has a ready market, the mine being close to Richmond, and the natural coke being a fuel for which there is a popular local demand. Some consumers claim that it is even better than anthracite coal. The present development work is being pushed with a view to securing a large output in the early future. Much credit is due the management of the company for the energy and push they have displayed in opening up this property. The work has been made harder by reason of the fact that it is difficult to secure competent miners who understand the system of mining employed in working these seams. The coal is all shot from the solid, permissible powders, carbonite or monobel being used.

---

*Mining engineer, New Durham, N. J.

Where the pitch is sufficiently light, the natural coke seam is mined (undercut). The bottom bench or layer in the coke seam resembles coal and is termed by the miners "coaly." This lower bench, which is from 6 to 9 in. thick, is soft like bituminous coking coal. The floor of the seam is slate. The mining is all done in the "coaly" bench; but it is necessary to "snub off" the front of the coke in order to mine the seam to the required depth. When the mining is complete, holes are drilled in the coke by compressed-air rotary augers. The coke is blasted down and thrown into the sheet-iron chute, which runs to the gangway below where it is loaded into the mine cars.

Mules are used to haul the output to the sidings at the slope, from which point they are hoisted to the surface. The loads are hoisted from the slope in two-car trips and then run by gravity to the foot of the car-haul, by which they are carried up the incline onto the tipple, where they are dumped. The empty cars are run down the incline to a side track, where they are allowed to gravitate to the head of the slope. This arrangement has proven very satisfactory.

⁂

The Brush Creek Coal Field in Kentucky

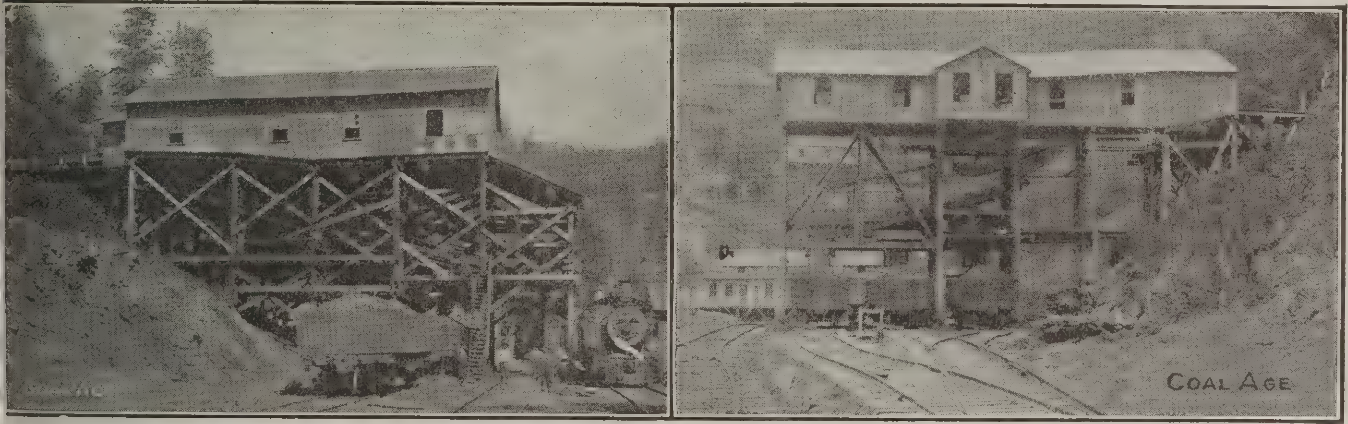
By Jno. C. McNeil*

SYNOPSIS—A brief sketch of the development of the Brush Creek field in Kentucky. Production is relatively small as yet but the coal is a popular grade and the indications point to a rapid increase.

⁂

The Brush Creek coal fields are situate in Knox County, Ky. and are wholly on the Cumberland Railroad, a short line in operation from Artemus to Wheeler, Ky. nd projected to Jellico, Tenn. to a connection with the . & N. and Southern Railroads.

This field was opened up by a syndicate from Warren, enn., who organized the Cumberland Coal Co. and ought up several thousand acres of lands on Brush reek. The same people organized the Cumberland R.R. o. to build a railroad line into the field and market the utput.



The Carter Coal Co.'s Warren Plant on the Left and the Anchor Mine on the Right

History of the Development

After installing a large plant at Warren, the company eased their mines to Col. John G. Matthews, of Barbourville, a coal operator of much experience in Southeastern Kentucky. Other plants were opened on the line by Dr. Samuel Bennett, at Bennettsville and Trosper. These operations were known as the Bennett Jellico Coal Co. and the Bennett Coal Co., respectively.

In the early part of 1908, the Geo. L. Carter interests purchased the lease of the Matthews Coal Co., in the Cumberland Coal Co. property and the lease of the Evans Jellico Coal Co. on the Bennett Coal Co. property. In the fall of 1907, the Bennett Jellico property was leased to the Trosper Coal Company.

In 1911, the Cumberland Railroad was extended up Tye Fork to Anchor and to Wheeler in the direction of Jellico. The Brush Creek Mining & Manufacturing Co. opened a mine at Wheeler and two operations were installed on the Tye Fork Spur by the Anchor Mining Co. and the Dean Jellico Coal Company.

The Carter interest, known in Kentucky as the Interstate Coal Co., later bought the properties of the Cumberland Coal Co. and the Bennett Coal Co. and also acquired large holdings of undeveloped lands. These interests, now known as the Carter Coal Co., control several thousand acres of coal lands in the Brush Creek field and have also purchased the property of the Anchor Mining Company.

---

*Chief clerk to general manager of the Cumberland R.R. o., Artemus, Ky.

A modern electric plant has been erected at Warren by the Carter interests which supplies the mines at Warren and Trosper, and will later supply the Anchor mine, with power. Coal washers have been installed at Warren and Trosper and loading booms and box-car loaders put in at Warren.

The Trosper Coal Co. have also installed box-car loaders at their plant.

The coal mined on the Cumberland Railroad is known as the Dean seam, which ranges from 5 to 7 ft. in thickness. An analysis of this coal from one of the mines in the Brush Creek field, made by the Kentucky Geological Survey, shows the following:

	Per Cent.
Moisture	2.63
Volatile matter	38.77
Fixed carbon	53.70
Ash	4.90
	100.00
Sulphur	0.76
Coke	68.60
B.t.u. per lb.	14487

The coal is sold throughout the Northwest by larg shipping concerns in Louisville, Cincinnati and Chicago and gives universal satisfaction because it stand stocking so well. It has a firm texture and does no disintegrate under severe weather conditions.

A troublesome feature in the Kentucky coal fields i the recent introduction of the big hopper-bottom "battleships." This is in some cases necessitating the reconstruction of the tipples.

The mines now being operated are:

The Dean Coal Co., owned by Knoxville interests; th Trosper Coal Co., owned by Jellico, Tenn. interests; th Carter Coal Co., at Warren and Trosper, owned by Johnson City, Tenn. interests; the R. C. Tway Mining Co. owned by Louisville interests and the Brush Creek Minin & Manufacturing Co., owned by Jellico, Tenn. interest

The present output of the various mines is about 200 tons daily. This is being gradually increased and because of the large undeveloped areas connected to th mines and owned by the operators, the Brush Creek fiel presents large possibilities of becoming a heavy produce in the near future.

⁂ ⁂

A Chinese Coal Cableway

By A. Gradenwitz*

SYNOPSIS—A modern aerial tramway supplanting a continuous caravan of camels and pack mules. Mining is, however, still carried on by the peasants in the most primitive manner, each man or family working independently and employing antiquated hand methods.

⁂

The coal from the mountains to the west of Toli was in former times, the only one marketed in Peking, and was conveyed to the capital in a rather primitive fashion, b an endless file of camels and mules reaching the whol way back from Peking to the coal mountains. Rive passages were duplicated, those on one side being reserve for caravans coming from the mountains and those o the other for caravans going in an opposite direction These passages consisted of dams, comprising interme iate fagot layers, through which the water was allowe to pass.

---

*Berlin, Germany.

General View of Line in Rear of Toli with Mountains in Background

An Endless Caravan of Camels and Mules Has Been Supplanted by the Cableway

The construction of railways, however, resulted in the anthracite coal from some mines in the neighborhood of Peking being conveyed to the capital and there sold. In order therefore to cheapen the transport and to render its own coal marketable again, the Salt Corporation of the city of Tientsin, province of Petchili, some years ago decided to install a mechanical transporting plant and entrusted Messrs. Adolf Bleichert & Co., of Leipzig, with the construction of a cableway.

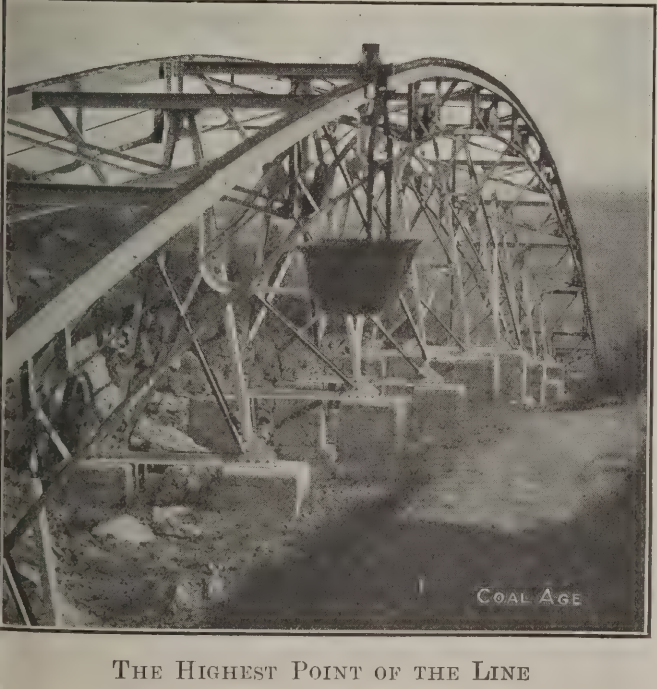
Surveying was commenced in the summer of 1908 and the construction of the plant was completed in July, 1911, though some sections had been inaugurated beforehand. Building materials were supplied by rail as far as the railway station of Toli, being thence taken by camels to the building grounds.

The Extent of the Cableway

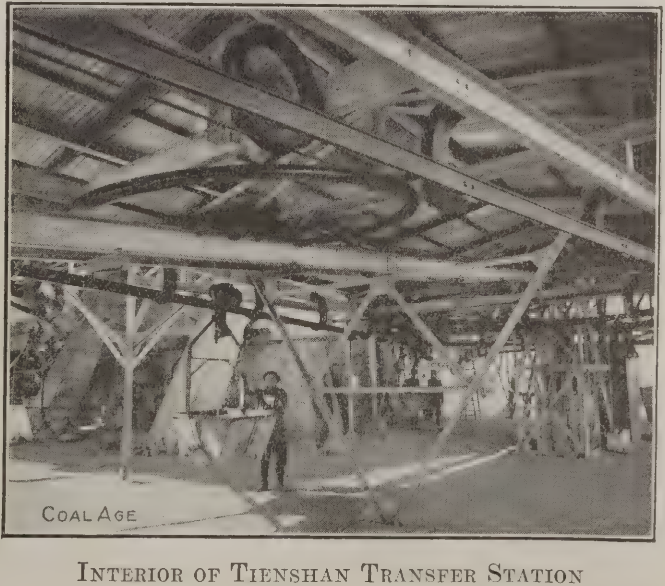
The cableway comprises a first section (Toli I) from the railway station of Toli to the Tienshan transfer station, with an angle station near Natcheing, which at the same time serves as a driving station. Near Chiantshanggu, there has been provided a loading station and near Wangfutang there is an intermediate and driving station. From the Tienshan transit station the line branches out into a section (Toli II), leading across the loading stations of Hoshan, Shinanhing, Pedian (driving station), Fungdia, and Nantze to the terminal and loading station of Chin Chiankon, on one hand, and into a section (Toli III), leading from the driving station of Forzshwang to the terminal and loading station of Hung Mechan, on the other.

The first section (Toli I) is 9.15 km., (about 5.7 miles), the second (Toli II), 7.89 km., (about 4.9 miles) and the third section (Toli III), 7.2 km., (about 4.5 miles) in length, the total length thus being 24.24 km., (15.1 miles). In the first section there is a fall of 142 m., (465ft., 9 in.); the two portions of the second section have a fall of 177.28m. (581ft., 6in.) and 155m. (508 ft., 5 in.) respectively, and the third section at first a rise of 65m., (213ft., 2in.), followed by a fall of 31m., (101 ft., 7 in.). The output of the first (common) section is 50 tons per hour, or about 1000 tons during a 22-hour day and night service, the output on the two other lines being 20-23 tons and 17 tons per hour respectively. These figures are, however, only preliminary.

A total of 439 buckets is operated on the cableway for the transport of anthracite coal, the speed on the first section being 2.5m., (8.2 ft.), on the second section 2.5 m., (in the lower portion) and 1.5m. or about 5 ft. (in the upper portion), and on the third section 2.5 m. per second. For the first section, there has been provided an 80 hp. driving motor, for the second section, three motors of 15, 13 and 6-7 hp. respectively, and for the third section, two driving motors of 25 and 15 hp. re-



The Highest Point of the Line



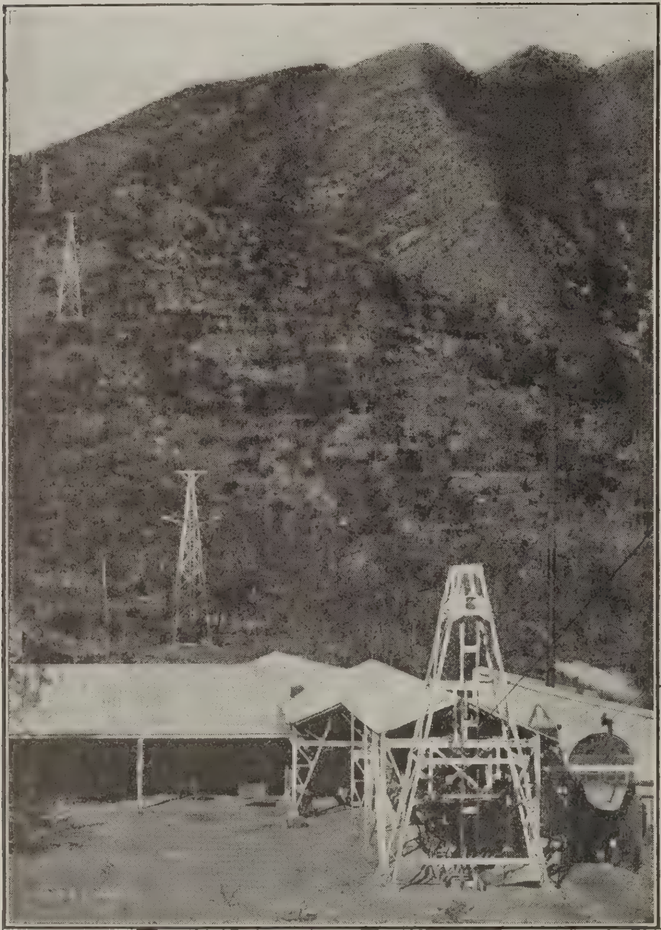
Interior of Tienshan Transfer Station

spectively. Semi-transportable steam engines (locomobiles) are used in all cases.

The Mines and Mining Methods

There are in all about 600 coal mines, many of which are temporarily shut down, the men being unable to deal with the water, while many are only worked with a few hands. The coal is conveyed by camels or mules from the mines to the loading stations of the cableway, in order there to be dumped into storage hoppers and transferred into buckets. It is afterwards taken to Toli by cableway and to Peking by rail, where about 12 Chinese dollars is netted for each ton (1 Chinese dollar=45 cents in American money).

Some words might be added to show the primitive way these mines are worked by the natives:—The coal seams come to the surface in the Western mountains at an angle of 0-35°, the upper stratum of the mountain slopes is a carbonate of lime formation containing some lime caves. All peasants in this district are on their own ground engaged in coal mining of the most rudimentary description, by hewing with primitive iron picks on the coal, in which work they are assisted by their sons and other male relatives.



Natshoing Angle and Loading Station

The men make their way into the seam up to 3 m. (about 10 ft.) thick through several tunnels, between which the seam is left intact, so that only the volume of the tunnels and cross-cuts is extracted. Timbering is only provided in a few of the tunnels. The tunnels only penetrate a distance of 100 to 120 m. (330 to 400 ft.) into the mountain, and after a seam has thus been worked or stripped, the mine is allowed to decay and another tunnel is dug at some other place, e.g. 20m. (65 ft.) higher.

The coal hewn is dragged up a primitive ladder to the surface in baskets and poured out on a waste heap. On arriving at the top of the heap, the miner sits down in the basket and thus slides back into the tunnel. Above the mouth of the latter, a rude house is erected, which accommodates the whole family.

⁂

A Pledge to Safety First

The *Railway Age Gazette* prints a description of a new departure in the "Safety-first" movement which is as follows:

The Grand Trunk Railway of Canada, on which George Bradshaw has been promulgating "safety-first" ideas, has issued a placard 10x6½ in. the substance of which is reprinted below. The lettering is blue and red on white carboard—a red, white and blue effect. At each corner, in the border, is a print of the safety-first button.

Grand Trunk Railway System
The Pledge

I will Railroad (mine) according to the (Book of) Rules. I will do all in my power to guard against unsafe acts on my part. If I see a fellow employee doing his work in an unsafe manner, I will speak to him, as a friend, and use my moral influence to have him perform his duties in the Safest Possible Manner. I will remember and practice at all times SAFETY-FIRST.

EIGHTY-THREE PER CENT. of all persons injured on railroads are YOU MEN WHO WORK FOR THE ROADS. SIXTY-SIX PER CENT. of all preventable injuries sustained by you are DUE TO UNSAFE PRACTICES which you could avoid.

⁂

Coal Mining in China, 1912

The present coal production of China is estimated at 9,000,000 to 13,000,000 tons a year. The most important event in the Chinese coal-mining world in 1912 was the amalgamation of the Chinese Engineering & Mining Co. and its rival organization, the Lanchow Collieries, under the title of the Kailan Mining Administration.

The consul general at Tientsin reports the total output of the coal mines in the Kaiping Basin for 1912 as 1,706,658 tons, as compared with 1,433,546 tons in 1911. The anthracite mines of the Peking Syndicate (Ltd.) in the province of Honan are credited with an output of 549,877 tons, an increase of 32 per cent. over 1911.

The Chinghsing collieries, in southern Chihli, are reported to be preparing for larger development. Their present output is given as 1000 tons per day. The output of the Fangtze and Hungshan collieries, belonging to the Shantung Mining Co., is reported as 469,157 tons in 1911, and 573,677 tons in 1912. The Fushun collieries, near Mukden, operated by the South Manchurian Ry. Co., produced 1,470,150 tons in 1912, and the mines at Yen Tai, operated by the same company, had a total output of 43,104 tons. The Pinghsiang mines, owned by the Hanyang Iron & Coal Co., produced but 232,373 tons in 1912, as compared with 648,476 tons in 1912.—*Daily Consular and Trade Reports.*

Relation of Big Business to Mining

By Charles Richard Van Hise*

YNOPSIS—It is suggested that there be an interstate rade commission and state trade commissions, which hall have substantially the same powers to regulate coperation in industry that the Interstate Commerce Comission and the State Commerce Commission have in reard to the public utilities.

⁂

It is generally agreed, that concentration of industry up o a certain point is necessary in order to give efficiency. t would not be held by anyone, I imagine, that we should eturn to the situation of 50 or 60 years ago, in which inustry was minutely subdivided, in which there were few rganizations of large size, but many minor organizations cattered all over the country. Do you believe—do any f you believe that we shall ever return from the great our mill to the cross-roads grist mill? It is impossible. This illustration and many others which could be menioned show that some degree of concentration is allowble. The practical question is: What degree of conentration is permissible and advantageous, not only for conomy in production, but for the advantage of the eople at large? It is therefore clear that it does not neet the question which confronts us in regard to the o called trusts to assume that all of the concentrations f industry are monopolies.

The Laws Relating to Big Business

Monopoly has never been recognized in this country by ommon laws, nor by statute law; neither has it ever been o recognized in England. Coöperation in industry both y combination and by contracts has been recognized by e laws of both countries. The distinction is fundaental. In England in the middle ages both common nd statute laws were stringent against combinations and ontracts in restraint of trade. But Parliament more than 0 years ago wiped out all the statutes against such ombinations and contracts, provided they were not onopolies, contrary to public policy, or immoral.

Also, in this country, in colonial days, the laws were rict against combinations and contracts in restraint of ade. But here, also, there was a gradual amelioration the laws until coöperation was permitted, along many nes, including division of territory, limitation of output, d even fixing of prices; provided, always, that as a relt of the coöperation the combination or contracts did t result in monopoly or were not general, were not imoral and were not contrary to public policy.

Thus we see that the laws in regard to combinations d contracts in restraint of trade went through a similar olution both in this country and in England, and that e laws finally became liberal. In other countries than ngland and America, the laws in regard to coöperation e also liberal. By gradual development the principle s been reached for most civilized nations that freedom trade means freedom to combine as well as freedom compete. This was the situation in this country also hen in 1890 the Sherman law was enacted, and imediately the wheels, so far as coöperation was concerned, ere turned back to the conditions of the middle ages. All combinations and contracts in restraint of trade were prohibited, and this applied to the latter even if limited in extent or confined in time. This national legislation led to an influenza of similar legislation in the states and, within a few years, more than 30 states had passed statutes against combinations and contracts in restraint of trade, many of them even more drastic than the Sherman law.

The question now arises: What were the results of these statutes? The Sherman act contained two separate provisions, one of which prohibits every contract and combination in the form of trust or otherwise in restraint of trade as illegal; another section provides that monopoly or attempt to monopolize is also illegal.

New Attitude of the Supreme Court

By the public it was supposed that every contract and combination in restraint of trade meant what the words said, and that Congress in using these words meant to pass a new and drastic law replacing the common law; indeed the earlier decisions of the Supreme Court took this point of view and held that the reasonableness or unreasonableness of a contract or combination was immaterial. However, in the Standard Oil and Tobacco cases the court took an entirely new attitude and stated that only restraint of trade which was undue was meant to be covered by the law (although the word "undue" is nowhere in the act), that the restraint meant was that which was not permitted under the common law; and, therefore, that only contracts or combinations were prohibited by the law which were unreasonably in restraint of trade.

The Existing Situation

What is the situation with which we are confronted? The Sherman law and the state anti-trust laws are upon the statute books. We have gone through one stage of development, have made the first step in the second stage. In is now proposed to neutralize the decisions of the court by defining "reasonable" so that it shall mean prohibitive of all contracts and combinations in restraint of trade, and thus succeed in getting statute law back to where Senator Sherman and the people thought they had gotten it 30 years ago through the enactment by Congress of the Sherman act. This would compel the beginning of another third cycle of development.

This solution of the problem of combination makes me think of the philosopher, Harold Udgardin, by name, an Esquimau who lives up on Hudson Bay. "Harold has one trap now set in the same place where it has been for 20 years; he has not yet caught a fox in it, but he will not consider changing its location, as it is a good place, he reasons, and ought to catch a fox. "It preys on his mind if he doesn't visit and trim this fox trap regularly, and he has been known to get up and go out in the night to bait it when he was especially negligent."

Notwithstanding that the trap of the Sherman Act has never caught a fox for 20 years, and only smells in one or two places of a tail or a leg, it is proposed to strengthen its "springs" and sharpen its "teeth" with the expectation that it will then catch a sufficient number of foxes to become the solution of the great fundamental problem of concentration of industry.

Note—Abstract of address to the 16th annual convention of e American Mining Congress, Philadelphia, Oct. 20-24, 1913.

*President of University of Wisconsin.

Sherman Law Should Apply to Small Dealer as Well as the Greatest Trust

In regard to the Sherman Act, it has been assumed that its only violators are the great combinations. This assumption is made in practically all discussion of the question. The Steel Trust, the Tobacco Trust, and a few other large combinations are mentioned; and it is supposed that the small business men and the small producers are not acting in violation of the law. But the principle of coöperation which the Sherman Act tries to suppress extends from the great industrial centers, like Philadelphia, to the country cross-roads. Does it make any difference here in Philadelphia, the home of anthracite, whether one buys anthracite of one retail dealer or another? It doesn't make any difference in the country cross-roads either. The price is just the same from all the dealers in the same locality. The same is true ot ice, the antithesis of anthracite, and is also true of all standard articles.

The principle of coöperation has extended from the great manufacturers and the great dealers of the large cities to the small manufacturers and small dealers of the small cities and even villages. All are coöperating in exactly the same way; the principle is the same for the large and small men, one is violating the law just as certainly as is the other. I am willing to stand for enforcement of law when the law is enforced alike for all; but when somebody is picked out because he is in the front seat, or because it is good politics to attack him and ninety-nine or nine hundred and ninety-nine are allowed to escape, I say that it is a profoundly immoral situation. And that is exactly the existing situation in this country. The politician who says "Break up these trusts; destroy them," says with the very same breath, "We must have coöperation among the farmers."

Why, gentlemen, the cranberry growers of Cape Cod, New Jersey, and Wisconsin, sell about 90 per cent. of their products through an agency down in Hudson St., New York. Similarly, many products of the farmers, illustrated by cotton, citrous fruits, etc., are marketed through coöperative selling agencies. Have we heard ot the Attorney-General prosecuting these farmers? Congress understands the situation and at its two recent sessions it attached to the sundry civil bill a clause containing an appropriation of $300,000 for the enforcement of the antitrust laws, which included the provision that none of this money should be spent in prosecuting combinations or agreements of labor, nor spent "for the prosecution of producers of farm products and associations of farmers who coöperate and organize in an effort to and for the purpose to obtain and maintain a fair and reasonable price for their products."

The purpose of this provision is clearly to make the Sherman law class legislation by indirection and, in effect, to prevent equality before the law of the manufacturer as compared with the farmer. Also, some of the smarter state legislations have seen the situation, and in order to prevent the farmers from being hit by their antitrust bills exempted the products of the lands so long as in the hands of the producers. This was true for Texas, Louisiana, Illinois and South Dakota. You see the state legislature, like Congress, saw tnat the farmers have so many votes that they have to be dealt with gently when they form a trust.

The Farmers Will Not Be So Enthusiastic About "Trust Busting"

But some of the state laws got into the United States courts, and these courts promptly declared these exemption unconstitutional as being special legislation, and not giving equal protection under the laws. I venture to predict that it will not be so popular a political game to shout, "Bust the trusts" when the farmers understand that their trusts are also to be "busted."

No more pernicious or immoral legislation was ever passed by Congress or by the states. Fortunately Ex-President Taft and President Wilson have both protested against the pernicious action of Congress. The principles of justice in regard to trusts and combinations are alike for the manufacturers, the farmers and the laborers.

There is just as close-riveted an arrangement between the three icemen in the country town as there is in steel; and any solution of the problem of combination, if it be a just solution, must be applied not only to steel tobacco, etc., but to the small tradesmen and the farmer Just as certainly as the great combinations are violating the Sherman Act, as I have no doubt many of them are so are the small aggregations of wealth violating state antitrust statutes. This general violation of the trust laws, national and state, is the problem that we have before us.

The Breakdown of Competition

The late Attorney-General of the United States, Mr Wickersham, said: "If we can only break up each of the great combinations into six, or eight, or ten parts, these different parts will compete; the tendency to competition under such circumstances is irresistible." But I tel you, gentlemen, the tendency for coöperation in this Twentieth Century is so much stronger than the tendency for competition, that you will never restore the latter in the old sense.

There will be competition between different classes of goods; there will be competition between the great mail-order house and the village grocer; there will be competition in service; and I am just as anxious as anyone to have trade regulated by competition as far as possible but, as a matter of fact, competition has broken down hopelessly in this country to adequately control prices to adequately control quality; and we all know it.

We have recognized the failure of competition to secure quality by the establishment of the pure-food laws. Why should we have pure-food laws if competition will give us good quality? If articles were fraudulently sold, so important to the general welfare as foods, there was a remedy in the courts. If I were sold a thing as pure strained honey, that was wholly innocent of having any relation whatever with a bee, I had a remedy in law; I had been fraudulently dealt with. Why didn't I take my case to the courts? You know why. The loss was so small that it was impracticable for the individual to thus obtain redress.

Finally, recognizing the fact that competition was wholly inadequate to secure pure food, national and state pure-food laws were enacted and special officers were designated upon whom was imposed the duty of protecting the public. When we confessed that competition did not regulate quality, and imposed the duty of protecting the public upon administrative officers, we succeeded in get ng pure food, or a reasonable proportion of pure food, least, and never until then.

Magnitude and Efficiency

Now, why is it that competition to regulate prices has oken down? Because of the simply enormous advan- ges which come with coöperation. One of these has en mentioned—the economic gains of magnitude. In is matter there are no differences of opinion up to a rtain magnitude. We all agree that the nation will not turn to the country grist mill; but this does not settle e question regarding the magnitude that is permissi- e.

I have looked through the books, and I have had perts examine the literature of concentration, to find investigations had been made which would give facts pon which to base a judgment regarding the relation efficiency and magnitude. The only such investigation which I find record is that of Herbert Knox in regard the steel industry. The late Commissioner of Corpora- ons, as the result of an elaborate inquiry, reached the nclusion that the large concentrations in the manufac- re of steel are very much more efficient than the small es, and for certain products he gave the amount per n. He stated that the five great combines—United tates Steel, Lackawanna, Cambria, Jones-Laughlin, Re- iblic—have an advantage for pig iron and steel billets om $2.50 to $5 per ton, as compared with the smaller ganizations. Similar investigations should be made r other lines of industry than steel, so that we may have scientific foundation upon which to decide how far we all permit magnitude.

The Forces Which Produced Combination

This brings us to the next point of the discussion—the rces which have led to combination in this country. ne of these is directly related to what has just been id. Each step from the loose association to complete erger was taken to escape the last decision of the court cause of the irresistible tendency for coöperation. Ger- any and England are vastly more fortunate than we are this respect, in that, permitting reasonable coöpera- on, they have allowed firms to coöperate wthout driving em to consolidation. The units of the various cartels id combinations in these countries have therefore sur- ndered their autonomy to a less extent than the ele- ents of the combinations in this country.

Other forces which have led to combination are the sire to eliminate or at least restrict competition, the de- re to limit output and divide territory—and in con- ction with these the maintenance of prices. These rces may be legitimate or illegitimate, depending upon e extent to which they are carried.

he Relations of Coöperation and Conservation

There can be no question that the competitive system, ien unrestrained, is positively opposed to the policy ot nservation. This is true alike for minerals and timber, it tonight I can only consider the first aspect of the bject.

The minerals of the earth, and here are included not ly the metallic minerals but the carbon compounds, quired the building of the earth for their making. Min- al deposits are doubtless in the process of manufacture the present time; but even if so, this is at so slow a te as to be negligible. From the point of view of mankind, the stores of minerals in the earth are deposits of definite magnitude upon which we may draw but once and which by no possibility can be increased. To illustrate, with regard to the banks of coal, the situation in regard to this subsurface produce of first importance for the human race is similar to that of a man who has a deposit in a bank upon which he may draw, but cannot by any possibility increase by a single dollar. He is obliged to make his existing bank account last throughout his life. Similarly the mineral resources of the earth must last throughout the life of humanity.

In this connection it should be recognized that modern civilization would not be possible without the mineral resources of the earth—no iron ships, no metal agricultural implements, no tools except those of stone, no fuel but wood. Without the subsurface products of the earth, we would at once return to the material conditions of the stone age.

It is therefore incontrovertible that, from the point of view of the human race, economic systems or laws which result in unnecessarily rapid use of the mineral stores of the earth are indefensible; but such are the economic theories and laws now dominant in the United States. The wastefulness of the competitive system may be proved with regard to every product which is taken from the earth.

Coal

The most disastrous losses in the mining industry, so far as the future of the human race is concerned, are in connection with coal. Dr. Holmes, in a paper upon mineral wastes, presents the facts in regard to the ruinous wastes of the unrestrained competitive system in connection with coal. He says that in the early days of mining, when there was much subdivision of ownership, that not more than 30 to 40 per cent. of the anthracite coal in the veins mined was brought to the surface, leaving from 60 to 70 per cent. in the ground. He states that even at the present time not more than 50 per cent. of the anthracite reaches the surface. The situation is similar for bituminous coal, but until recently the losses for such coal were substantially half. This loss has been somewhat reduced, but it continues to be appalling.

Dr. Holmes estimates that since the beginning of mining in the United States, "two billion tons of anthracite and three billion tons of bituminous coal have been left underground in such condition as to make its future recovery doubtful or impossible." The principles which, from the point of view of conservation, should apply to mining of coal are well known. So far as practicable the mines should be so worked as to make one superimposed vein after the other available. Coal slack should be reduced in amount and should be utilized. No considerable percentage of coal should be left in the ground as pillars. If these reforms were introduced, the losses could be reduced to half the present amounts and possibly to one-fourth.

Under the Sherman law there is no opportunity to limit output, divide territory, or regulate prices. If the operators could agree upon limtation of output, and division of market so as to reduce freights, and could arrange for reasonable prices which would give them no more than their present profits, they would then be able to follow these principles in mining their coal; for they themselves would be gainers in prolonging the life of their mines, and, far more important, many future generations would be the immeasurable gainers in that they would have an adequate coal supply.

It is doubtless true that the plan proposed would result in somewhat higher prices for bituminous coal; but, even so, coal would be cheaper in this country than in others. This slight additional increment, however, would be but a small social burden for this generation to bear in order to leave an adequate heritage to future generations. Under the competitive system, we are recklessly skimming the cream of the natural resources of a virgin continent with no regard for the rights of our children.

Corrective Measures

My proposal, gentlemen, is neither regulated competition, nor regulated monopoly, but retention of competition, prohibition of monopoly, permission for coöperation and regulation of the latter.

It has been proposed that combinations should be so divided that no one corporation shall have more than 50 per cent. of any business. That is Mr. Byan's suggestion. In the case of the Stanley bill, the presumption of the violation of the Sherman law is against a corporation having more than 30 per cent.

Now, it makes no difference whether you break the great combinations up so that no one combination has more than 50 per cent. or 30 per cent. of a line of business, or so that there are 10 with 10 per cent., or 20 with 5 per cent. The demonstration of this lies in the fact already mentioned that thousands of farmers may and do coöperate in marketing their products just as perfectly as do the five great manufacturers of steel. This they do in various parts of the United States for numerous products.

At the present time there are state and national movements to still further extend the advantages of coöperation to the farmers. Since it is unquestionable that the sense of justice of the citizens of the United States will support the courts in prohibiting class legislation, we shall, therefore, I believe, ultimately permit coöperation in all lines of business alike. If we, however, retain freedom of competition, permit concentration sufficient to give efficiency, allow reasonable coöperation, and prevent monopoly, this will require regulation just as it has been necessary to regulate the railroads. This done, the Sherman law will be forgotten.

Has there been any prosecution of the railroads for violations of the Sherman law because of collusion in fixing rates? And yet, every one of us here knows that they are just as flagrant violators of the Sherman Act as any other class of corporations in the United States. Are the freight rates the same for different roads between any two points? Are the passenger rates between Philadelphia and Chicago identical on all roads? Can you do better in price by traveling over the Pennsylvania than over any other road? The rate is the same, providing the speed is the same. How does it happen that the roads all got together? Just by Providence, I suppose. It was doubtless by a Providential act that these rates were fixed identically upon all roads, under the same conditions, all over the country.

Why is it that nobody proposes to indict the railroads for collusion? Simply for the reason that the rates which they can charge are controlled by commissions, national and state. Nobody any longer wishes to make them further trouble, because the public is protected by its commissions. That is the sum of the whole matter. The railroads are just as much amenable to attack under the Sherman Act as any other combination in the United States; but when the railroads are giving reasonable rates and are competing in giving reasonable service, even if the law is on the statute books and is the hallowed thing that has been described, the sense of official justice is such that they are not attacked in the courts. Will the Attorney-General of the United States or the Attorney General of this or any other state bring suit against the railroads for conspiracy in fixing rates when the public is properly protected? I have not heard the proposal made anywhere.

However, it is a wrong condition when we have on the statute books a law of a kind which requires the officials of justice to close one eye whenever they pass by the men in control of one great group of industries, and a the same moment see other men not one whit more guilty We ought to remedy this condition so that honorable business men shall not be in the position, the unfortunate position, of being technically violators of statutes which are not advantageous from the public point of view to enforce

Trade Commissions Should Be Created

I have not time to more than touch upon necessary modifications of the law; but the substance of my remedied proposal is that there be an interstate trade commisson and state trade commissions, which shall have substantially the same powers to regulate coöperation in industry that the Interstate Commerce Commission and th State Commerce Commissions have in regard to the public utilities. It seems to me that the Interstate and Stat Commerce Commissions and the administrative bodies fo the pure-food laws point the way for the next constructive step in the development of the laws.

The Sherman Act can be left to apply, as defined by the Supreme Court, to monopoly. Unreasonable restrain of trade may be defined as monopolistic restraint of trade and it is rather generally agreed that monopoly should be prohibited. To make the matter perfectly clear anothe amendment should allow reasonable coöperation, but such coöperation should be under the watchful eyes of administrative commissions in order to protect the public.

Powers of Commissions

The coal operators at a conference held in Chicago in May, 1912, agreed upon a bill for the establishment of an interstate trade commission. The important power proposed for such commission was the authority to decid whether any proposed arrangement is in opposition to th Sherman Act as it now exists under the interpretation o the courts. If any arrangement is approved by the commission as in accordance with law, then the organization which enters into such an arrangement is to be free from prosecution under the Sherman Act. Also the commission is empowered to require the discontinuance of any existing trade arrangement, practice or combination, which i found to be in violation of the national trust law.

From the foregoing discussion it is apparent that while the above proposal is a move in the right direction an is an improvement upon the present situation, it is no adequate. The frightful wastes of unrestrained competition as applied to mineral products, and especially as applied to coal, can only cease when operators are permitted to coöperate in limiting and dividing the market. However, if they are permitted to thus coöperate, there i nger that the public may be required to pay unreason-ble prices; and therefore any such coöperation should be nder the watchful eyes of commissions that should have ower to require the discontinuance of any trade arrange-ent found inimical to the public welfare.

Ultimately also it will probably be found necessary to ve the commissions the same authority in regulating ices that the State and Interstate Commerce Commis-ons have in regulating rates for the public utilities. The irden of fixing prices should rest with the operators; it whenever any man feels that a price is unreasonable, e should have the right to have his case brought before commission for adjustification. If, after investigation, ny price is found to be unreasonable, the commission ould have authority to issue an order that it be made asonable.

All Unfair Practices Should Be Prohibited

The proposed trade commissions should have a number other powers which I have not time fully to discuss. is clear that all unfair practices should be prohibited; d by unfair practices is meant to include everything vered by the term immoral practices under the com-on law. If I were to define unfair practices, it would that they should include all those practices of every nd which are inimical to the welfare of the people.

Another, and perhaps the most vital, point of the law eating the state and interstate road commissions should that when an individual is wronged through unrea-nable rates, or rebates or other discrimination, it should the duty of a public commission to handle his case.

Powers to Be Given Gradually

I should not expect that these trade commissions, if eated, would at once be granted all the powers which ey would finally exercise. In this matter I should expect e same slow development to take place that has occurred garding the commissions which control the public utili-es.

More than 40 years have elapsed since the creation of e Interstate Commerce Commission. These early com-issions had the powers of recommendation of requiring iblicity, etc. Finally the commissions of Illinois and wa were given the power to control rates, but compara-vely little came of this authority. It was not until 05 that in Wisconsin a comprehensive law was enacted control the railroads. The passage of the law was rongly resisted by the companies, because of the fear at the proposed commission would treat them unfairly, t the act was passed despite their opposition.

Under the law, there were appointed in that state by nator R. M. La Follette, then Governor, a scientific mmission composed of three men, one a well known wyer, the other a keen statistician and the third an inent professor of transportation. I have heard from ny of the railroad men, including a railroad president d some of the ablest railroad lawers, that the Wiscon-n commission has been fair and reasonable both to the ilroads and to the public. Neither side would go back the previous situation—upon one side hold-up bills to defeated by questionable methods at each session of the gislative; upon the other side numerous rebates and scriminations. Before we had a railroad commission Wisconsin there was continuous war between the peo- and the railroads. Since that commission has been created, and especially since its authority has been extended over all the public utilities of the state, including the adjustment of rates, we have had peace.

Interstate Commerce Commission

Similarly, the Interstate Commerce Commission had small powers at first, merely powers of recommendation; and it was only six years ago that this commission finally gained the power to fix maximum rates; and at the present time the commission has not the power to initiate rates. The initiative rests with the railroads. It is only two years ago that the Interstate Commerce Commssion gained the power to suspend advances of rates pending investigations regarding their reasonableness. Thus, stage by stage, conservatively, the development of the control of public utilities by administrative commission was worked out.

Substantially the same history applies to the pure-food laws. Doubtless the extension of laws of this class will go on until fabrics are included; until fraud will be practically eliminated through the use of false names for any commodity.

I would have the proposed trade commissions pass through a similar history. Thus, precisely as with the Commerce Commissions, by slow development, industry where coöperation has so extended as to become affected with a public interest would be controlled by trade commissions under the same lawful methods that have been applied to the public utilities. Concentration, coöperation, and control are presented as the keyboard to the solution of our great industrial problems.

⁂

Natural-Gas Consumption in Pennsylvania

From almost every point of view, the consumption of natural gas in Pennsylvania surpassed in 1912 that of any previous year. According to B. Hill, of the U. S. Geological Survey, the consumption in 1912 reached a total of 173,656,300 cu.ft. This gas was used largely for manufacturing and other industrial purposes, the quantity thus consumed reaching 124,324,911 cu.ft. valued at $14,333,048, the average price being 11.53c. per thousand cubic feet. It is needless to say that Pennsylvania leads all other states in the quantity of gas consumed.

Gas is the ideal fuel for the manufacture of iron, steel and glass, for which the state of Pennsylvania is noted. The presence of natural gas in this state has helped to make it the leading manufacturing commonwealth in the country. Since the introduction of natural gas into the industrial establishments of Pittsburgh, in 1883, this district has continued to grow until it has become the greatest industrial center in the United States. It is estimated that more fuel is consumed in the city of Pittsburgh and its immediate vicinity, and more coal and coke is shipped into and through the Pittsburgh dstrict than any other district in the world.

⁂

When it is necessary to use doors in mines, these should be given a sufficient fall to close readily, or be made self-closing by the use of weights or other means. It is generally necessary to have an attendant or trapper at most doors on main haulageways and because these trappers often neglect their duties, trouble results. If the doors are made to close automatically, much of this trouble will be avoided, as the doors will close when released.

LEGAL DEPARTMENT

Place for Delivery of Coal

By A. L. H. Street*

SYNOPSIS—Silence in contracts to sell coal as to where delivery shall be made frequently leads to litigation. Trade custom or surrounding circumstances sometimes supply omission. Judicial construction placed upon particular words and phrases which have been used in coal sales contracts. Review of cases passed upon by the appellate courts.

⁂

Contracts to sell coal have often been involved in litigation on account of their failure to clearly specify where the parties intended delivery to be made. As pointed out in a recent article in Coal Age, treating another phase of the subject (that involving the question when delivery to a carrier operates as delivery to the buyer), the question as to what place is fixed for delivery becomes important in instances where the ownership of the coal or other subject of sale at a particular time is in dispute, as affecting, among other things, questions whether the buyer or the seller is the proper person to make claim against the carrier for any loss or delay of the shipment during transportation, or whether the seller is entitled to recover the contract price, notwithstanding the loss or injury. Avoiding the phases which were treated in the article mentioned, I present the following observations, which are based upon the appellate court decisions cited:

When a Contract Is Silent as to Point of Delivery

It is usually held by the courts that when a contract is silent as to where delivery is to be made, it will be presumed that the parties intended that delivery should be made at the place where the subject of sale was situated when the bargain was concluded. The legal principle will be controlled, however, by any contrary trade custom, in view of which the parties may fairly be presumed to have contracted; or the intention of the parties as to where delivery shall be made may be inferred from the surrounding circumstances (45 Nebraska Supreme Court Reports 655). Accordingly it has been held that, under an agreement to sell coal at a specified price at the mines, for shipment to the buyer at Chicago, with draft attached to the bill of lading, payable on arrival of the coal, delivery was required at Chicago, though the buyer agreed to pay the freight (80 Illinois Appellate Court Reports 144.)

When a contract requires delivery in a certain city, but it and the surrounding circumstances fail to disclose the intention of the parties as to the exact place where delivery was intended to be made, the buyer is entitled to fix the particular point at which he desires delivery (36 Missouri Supreme Court Reports 310). Prepayment of freight charges by the seller tends to show an understanding that delivery is to be made at the destination, but does not, of itself, conclusively establish such intention (Pennsylvania Supreme Court, 50 Atlantic Reporter 928.)

A Case in Arkansas

It would seem that a contract to sell coke "f.o.b., Van Buren, Ark.," too plainly requires delivery at that point to render it necessary to invoke judicial interpretation, but the Arkansas Supreme Court has been called upon to affirm that point (122 Southwestern Reporter 239). On the other hand, however, a contract by a Philadelphia coal company to furnish a Rhode Island concern with its coal requirements at "$2.40 per ton of 2240 lb.. f.o.b., Philadelphia" was held to merely fix the price up to that point and to require delivery at the buyer's yard, where the agreement further specified that a third party or any other mutually satisfactory concern should freight, insure, unload and haul the coal to the buyer's works for $1.35 per long ton; that the total payments to both parties should be $3.75 per long ton, delivered at the buyer's yard; that the coal should be delivered at such times and in such quantities as the buyer should direct; and that the seller should have at least one thousand tons of coal constantly in the buyer's yard, which amount should not be stored during continuance of the contract without being drawn upon by the buyer; but that the coal should remain at the seller's risk and not be paid for until expiration of the contract, etc. (United States Circuit Court of Appeals, First Circuit; 162 Federal Reporter 848.)

How an Ohio Coal Company Lost Out

A contract by an Ohio coal company to furnish fuel for the use of "The Edison Illuminating Company, of Detroit, f.o.b. Michigan Central R.R.," was held by the Michigan Supreme Court to require delivery on the tracks of that railroad at Detroit. It was further held that postal cards sent by the coal company to the buyer, reading: "In our office. We ship this day on your account," followed by a schedule showing car numbers, quantity shipped in each car, etc., were not inconsistent with a mutual understanding that delivery should be made at Detroit (107 Northwestern Reporter 915.)

Where a coal dealer wrote a customer at Aurora, Ill.: "Until otherwise advised, the price of coal for future orders will be $4 for lump and nut, and $2.50 for pea coal, f.o.b. E., J. & E. tracks, your station," and in accepting a subsequent order wrote: "We cannot make the pea coal any lower than $2.75 per ton, f.o.b. E., J. & E. tracks, Aurora," it was decided that the contract required delivery to the customer at his home town; rendering it unnecessary for him to look to the carrier for delay in delivery (126 Illinois Appellate Court Reports 253.)

Agreement to "furnish" coal on board cars at a certain place constitutes a contract to deliver there, although, under the agreement, the coal is to be weighed at another point to which it is to be shipped (Iowa Supreme Court, 33 Northwestern Reporter 622.)

POWER DEPARTMENT

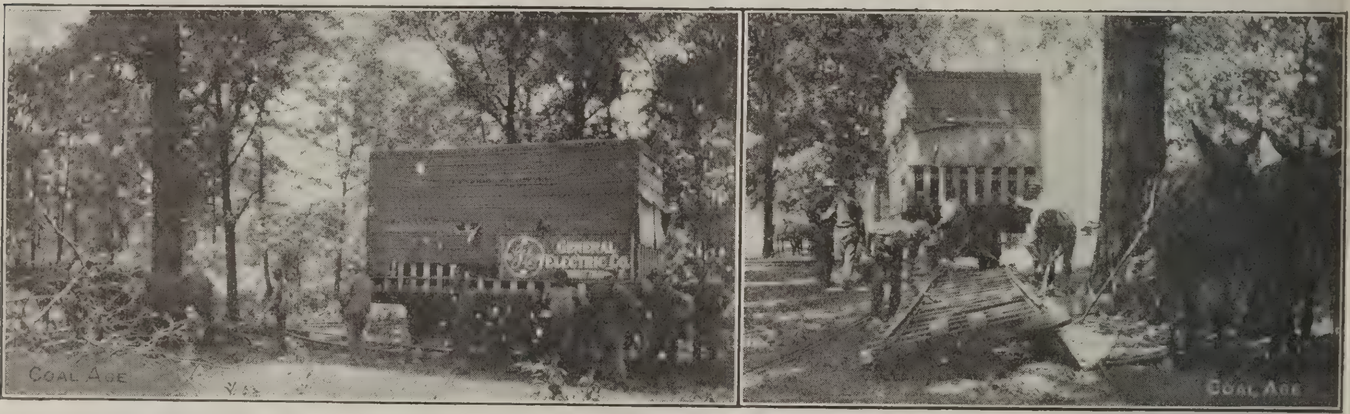
A Central Station in West Kentucky

By Newell G. Alford*

SYNOPSIS—The utilization of the exhaust steam from three air compressors for the generation of 500 kw. of alternating current. A considerable proportion of the power required for three mines is thus made from a waste product formerly thrown away.

⁂

With the advent of a central-power plant at Earlington, Ky., the St. Bernard Mining Co. has set the power efficiency pace for its fellow operators in the western Kentucky coal field, simultaneously inaugurating a new era for its vicinity and joining the quest popular in other districts for increased operating economy.



Two Views of the 500-Kw. Turbine Being Taken through the Woods to the Power Plant

During its continuous operation in the last 43 years this company has thrived under cautious management. Its high production mark was reached last year with an output of 1,750,000 tons of coal from its nine individual developments, the relative locations of which are shown upon the accompanying map.

The operation of these nine mines prior to the new installation required 4500 boiler horsepower, necessitating the consumption of 250 tons of run-of-mine coal per 24 hours. At each of the mines which the company operates electricity is used for either cutting coal, haulage or lighting. With the exception of mines No. 9, No. 11, and the Hecla shaft, each operation had its own isolated power-generating unit. From the No. 9 power house now abandoned direct current was transmitted to the three operations above named, but due to heavy line losses the potential varied considerably at the points of application.

Several Machines Were Discarded

The abandoned power house built in 1903 contained an accumulation of generating machinery which had been purchased from time to time as requirements demanded. The original installation consisted of four simple slide-valve engines direct connected to generators. The prime movers drew their supply of steam from five Erie City boilers of 150 hp. each on which steam pressure was carried at 70 lb. during operation.

In consequence of the relatively high operating cost of this plant a possible means of reducing its expense was sought, and attention was turned to the possibilities of the compressor plant located in the hills about one and one-half miles to the northeast of the old power house. This plant distributes compressed air within a radius of two and one-half miles to the working faces of No. 9 and No. 11 mines. The boiler room at this plant is 72 ft. long and 54 ft. wide. It is a wooden frame covered with corrugated iron sheeting. This structure contained a battery of four Erie City boilers, each rated at 150 hp., and upon which steam was carried at 95 lb. Occasionally for short periods these boilers were overloaded prior to the first operation of the new turbine installation. A fifth boiler has since been added.

Adjoining the boiler room is the air-compressor room 60 ft. long and 45 ft. wide, of the same type of construction as the former, with the exception that it has a concrete floor. Here two Norwalk and one Ingersoll-Rand straight line air compressors supply air under a pressure of 85 lb. These three machines compress 3538 cu.ft. of free air per minute during the day, and 3224 cu.ft. at night. Allowing for friction losses, the power required to compress this amount of air is 590 hp. during the day, and 538 hp. at night.

Assuming a steam consumption of 40 lb. per horsepower-hour, which is conservative in this class of apparatus, the steam consumed during the day is found to be 23,600 lb. per hour, while a corresponding consumption at night is 21,500 lb.

As a check upon these computations upon the available amount of steam, it may be stated that there is 600 hp. of installed boiler capacity, which, under normal rating, evaporates 30 lb. of steam per horsepower-hour, or a total of 18,000 lb. per hour. Since, however, the boilers were overloaded periodically it is safe to assume that there is at all times 20,000 lb. of exhaust steam per hour available for use in a mixed or low-pressure steam turbine. With this conclusion substantiated a course of action was mapped out which had as its culmination the generation of current from the exhaust steam from the air compressors.

---

*Earlington, Ky.

As Much Current Generated as Before

The installation of such a low pressure generating unit made possible the production of the same amount of current as was formerly generated in the old power plant without the fuel charges and expense of upkeep on the boilers and numerous machines. In other words, the steam consumed by the turbine at the new plant is merely a waste product from the air compressors. The only charges against such an installation are interest depreciation and the maintenance of the turbine and condensing apparatus.

The load on the former direct-current power house consisted of five mine locomotives ranging from 12 to 15 tons, five motors, four coal-cutting machines, and the mine lights at Hecla, No. 9 and No. 11 mines. This made a total connected horsepower of approximately 985, which is equivalent to about 740 kw. Readings taken at the old power house showed that the average load was about 240 kw., with a maximum peak of 550 kw. The latter never lasting over two or three minutes. This gave a load factor based upon a nine-hour day of 33⅓ per cent.

As this plant was a 250-volt direct-current installation, located at Earlington, some distance from the point where power was used, heavy line losses were incurred. These are for the most part eliminated in high-tension alternating-current transmission. Consequently it is perfectly safe to assume that the load factor on the new alternating plant does not exceed 35 per cent., including losses in the transformers, motor generators, and transmission lines.

Since the installation of the new units the following motor load has been added to the original amount. Two 25-hp. fan motors, one 5-hp. shop motor, and a 30-hp. motor for propelling the cooling tower fan. With these additions there is a total load of approximately 820 kw., which at a 35 per cent. load factor gives an average day load of 285 kw., with a maximum peak of approximately 625 kw. The plant above mentioned, however, was considered as the first step in the centralization of power, with still further developments to follow. Six of the company's mines still use isolated power generation. With this in mind, further expansion was constantly considered in all designs and specifications.

The type of alternating current to be adopted was the first problem to be dealt with. In the first place, there are two standard frequencies from which to choose, namely, 25- and 60-cycle. Each of these has its advantages, the former being perhaps better adapted to power transmission, and the latter to lighting. The line losses decrease as the voltage increases, but since the farthest point of application in this case was only three miles distant, and the element of adnger is to a large extent reduced by lower voltage, the current finally decided upon was three-phase, 60-cycle, at 2300 volts.

Provision Made for Using Live Steam

Although the exhaust steam supply from the air compressors is constant under normal conditions, there are times when one or more of these machines are shut down. With a mixed-pressure turbine any stoppage of supply from the compressor may be made up efficiently by live steam from the boilers. This is done by means of special expanding nozzles, which receive the steam at boiler pressure and deliver it against the turbine rotor. These nozzles, of course, occupy but a small section of the wheels' periphery. With this construction the normal power of the turbine can be secured from high- and low-pressure steam at the same time, the two pressures being utilized in whatever proportion the conditions demand.

There were two principal reasons for selecting the 500 kw. turbine of General Electric Co.'s manufacture: (1) The mixed-pressure machine offered by this company had a higher efficiency guarantee than the low-pressure turbines of other makes. (2) The mixed-pressure machine is available as a high-pressure turbine at reduced efficiency. This would be a highly desirable feature should the management at any time adopt a complete new installation, in which a low pressure turbine could not be advantageously employed.

A View of the Transmission Line

The street lighting for the town of Earlington is provided for in the Wood arc machine, which was moved to the new plant from the old power house.

Piping Details

Live steam is supplied to the compressor room by a 10-in. header on which is placed a horizontal cast-iron steam separator draining to two heaters of the open type. Immediately beyond this is a group of valves through which steam is delivered to the three air compressors, a 200-kw. Curtis turbo-generator unit held for case of emergency and the expansion nozzles of the larger turbine mentioned above.

The exhaust system consists of a 14-in. pipe extending from the heaters to the exhaust turbine. A tee in this line supplies the exhaust steam to the heaters, another provides an outlet to the atmosphere, while the exhaust from the compressors is teed in at convenient points.

Between the exhaust feeders from the compressor and the feed-water heaters is a 12-in. back-pressure valve located beside a 12-in. gate valve. The function of this back-pressure valve is to relieve the exhaust system when the supply from the air compressors exceeds the demand of the mixed-pressure turbine. Between the 12-in. gate valve and the feed-water heaters, the exhaust line from the condenser circulating pump enters the exhaust header. The circulating pump is, therefore, relied upon as the chief source of exhaust steam for feed-water heating purposes.

Since the exhaust from the air compressors contained about 10 per cent. of water in suspension and a considerable amount of oil, it was deemed wise to equip this line with a horizontal oil and water separator, which admits only dry steam to the low-pressure connection on the 500-kw. turbine. A similar piece of apparatus, but built for high pressure, protects the 200-kw. machine.

Between the oil and water separator and the 500-kw. turbine is a Davis flow-regulating valve. This tends to close when the exhaust steam demanded for the turbine exceeds that furnished by the air compressor. It also tends at all times to maintain atmospheric pressure between this valve and the compressors and prevents their speeding up. In other words, it prevents the vacuum from coming back through the turbine to the air compresors and their piping system. At such times, the deficiency of steam is made up by the high-pressure steam connection.

Placing the Turbine on Foundation

The condenser, which is common to both the 500-kw. and 200-kw. units, is located between their respective foundations. In arranging the piping to this machine, a 36-in. corrugated copper expansion joint was attached directly to the exhaust flange of the 500-kw. turbine; and a similar device 16 in. in diameter is placed upon the 200-kw. machine. This relieves the turbine structures from strains which would otherwise result from the expansion and contraction of the piping in the condensing system. Atmospheric exhaust release valves are inserted in this piping also.

Selecting the Condenser

The selection of the condensing equipment was an item which received careful attention in view of the fact that the water conditions were somewhat unusual. About a mile from the power house there is a lake 125 acres in area. It was first thought that by placing a pump upon its shore and laying an intake and discharge line from this point to the power house, enough water could be supplied for condensing purposes.

This, however, had its bad features, in view of the fact that it would have been an expensive arrangement, and, furthermore, that during the summer months the entire contents of the lake might have been heated up to a considerable degree.

Another alternative was as follows: To the north of the compressor plant is a steep ascent, on the top of which is an ideal spot for a pond of about 5 acres in area. This could have been secured with slight excavation and damming on one side. Water could then have been fed to the condenser under a gravity head and returned to the far end of the pond to prevent short-circuiting. This would allow a considerable area to act as a natural cooling surface. This idea was, however, abandoned in favor of a forced draft type of cooling tower with which apparatus an operator is, to a large extent, independent of atmospheric conditions.

The cooling tower chosen for the condenser is of the Barnard forced draft type manufactured by the Wheeler Condenser & Engineering Co. The tower is of steel-plate construction, the filling consisting of galvanized wire mats hung vertically edgewise to the air current, thus reducing the load on the fan. Two fans are employed upon a single shaft, which is driven by a General Electric 30-hp. motor.

This tower is guaranteed to cool 1450 gal. of water per min. (which is the amount necessary for circulating purposes) from 100 deg. to 83 deg. F., with air at 70 deg. F. and a relative humidity of 70 per cent.

A Jet Condenser Is Employed

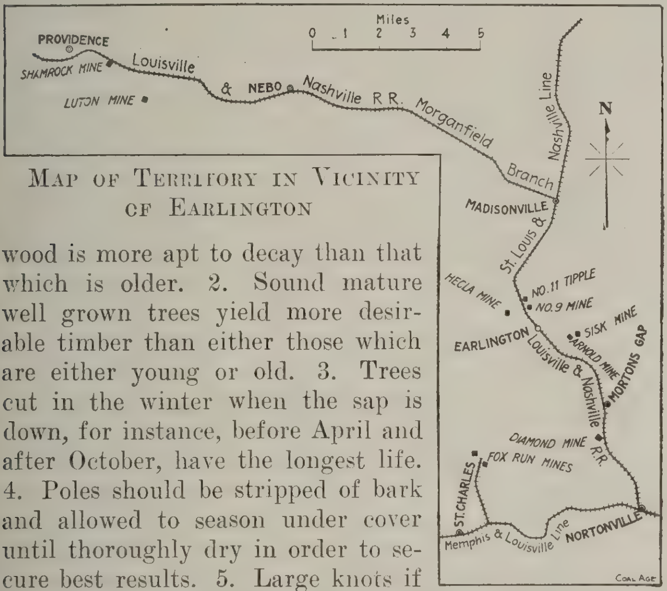
The condenser is a Wheeler rectangular jet of the low level counter-current or rain type, and is designed to serve both the 200-kw. high pressure and the 500-kw. mixed pressure turbine, maintaining a vacuum of 27 in. referred to a 30-in. barometer when operating with the cooling tower under the conditions above named. Steam enters at the end of the shell which is amply proportioned to prevent any loss due to the pressure drop. The cooling water, which is siphoned from the tower tank, enters at the top and is broken up by a series of baffles and spray-plates into a fine rain, condensing the exhaust and becoming heated to a point very close to the theoretical temperature of the vacuum. The more intimate the mixture of the steam and water which can be obtained in a condenser, the smaller the quantity of injection water required. In this instance, the small amount of injection water necessary reduces not only the power demands upon the withdrawal pump, but also the size of the cooling tower. In practice, the temperature of the circulating water and condensate leaving the condenser is within 5 deg. of the theoretical temperature of the vacuum.

To remove the air and circulating water from the condenser and force it to the top of the cooling tower, a Christie patent high vacuum combined air and tail pump is mounted directly below the condenser. This is a horizontal double-acting brass fitted machine, in which air is admitted through a central port and is compressed up to atmospheric tension between the cone-shaped piston and the cover. The pump is unique in that the piston pushes the cover off its seating at each stroke, clearance being entirely eliminated. Make-up water for the condensing system is supplied through 5000 ft. of pipeline from a reservoir suppying house water to the town of Earlington.

High-tension transmission lines varying in length from 1¼ to 3 miles are carried on wooden poles placed 125 ft. apart. Ordinarily, these vary in length from 25 to 35 ft., and were cut from carefully selected and seasoned chesnut. Over rights of way, however, 45-ft. poles are used. The tops of these poles are cut wedge shape at an angle of 45 deg., the bottom being sawed off square. In order to prevent, as far as possible, undue decay caused from the collection of moisture, the gains, the tops of the poles and the bottoms as far up as the ground line, are given two coats of creosote.

The Specifications for Poles

In making the specifications for the line poles, the following points were taken into consideration: 1. Young wood is more apt to decay than that which is older. 2. Sound mature well grown trees yield more desirable timber than either those which are either young or old. 3. Trees cut in the winter when the sap is down, for instance, before April and after October, have the longest life. 4. Poles should be stripped of bark and allowed to season under cover until thoroughly dry in order to secure best results. 5. Large knots if sound and trimmed smooth are not objectionable. 6. A perfectly sound dead or dry streak which does not impair the strength of the pole is not a defect.



Map of Territory in Vicinity of Earlington

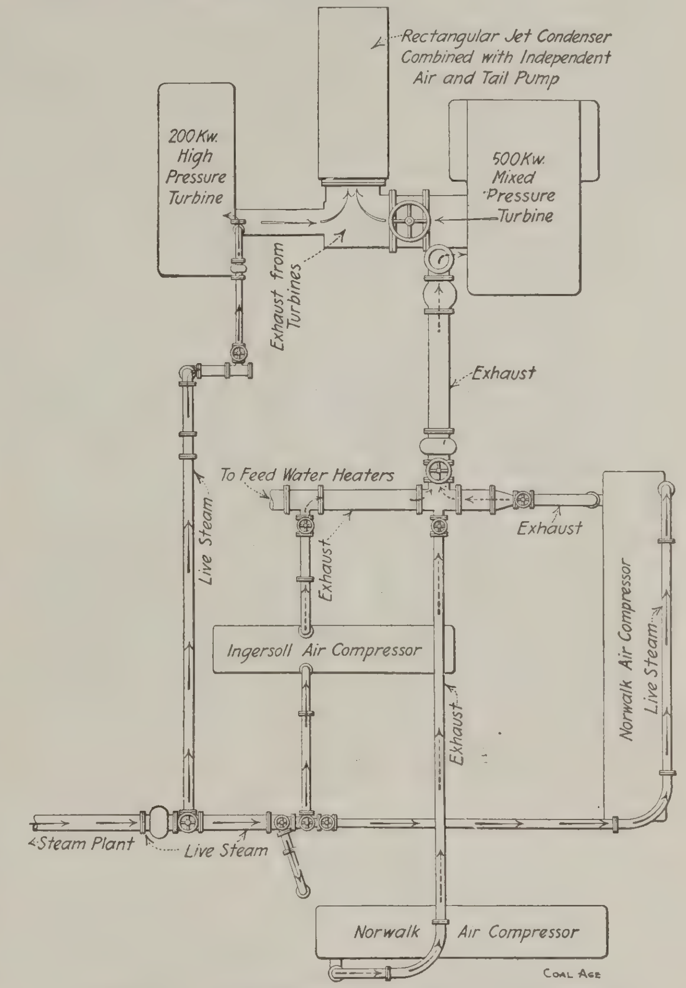
A continuous lightning-protection system traverses the entire length of the transmission line. This consists of No. 4 galvanized wire running continuously from pole top to pole top. The top of every second pole is equipped with a metal point, projecting vertically into the air on which in turn is fastened a short piece of wire. This projecting wire and metallic rod are then connected with the earth by a ground wire down the side of the pole.

The transmission right of way running for the most part through thick forest was cleared 20 ft. upon each side of the line. In addition to this, trees which were long enough to fall across the wires, were felled. The average height of the tree determined this factor and, since forest fires of magnitude rarely occur in this territory, 40 ft. was considered sufficiently wide.

The switchboard which was furnished by the General Electric Co. is of natural black slate, and was designed along lines of standard up-to-date practice. It is located so as to face the generators, thus avoiding unnecessary steps on the part of the operator. It consists of eight panels arranged as follows: One double exciter panel; two three-phase generator panels, one regulator and exciter motor panel, one double circuit, three-phase outgoing feeder panel, one three-phase motor and exciter panel, one D.C. generator panel, and one D.C. feeder panel.

These panels are arranged in a row with synchronism indicator and ground detector on brackets.

Instrument transformers are installed in the busses at such points as to operate a power factor indicator and curve drawing polyphase wattmeter, showing total load on station and the power factor. In addition, a vibrating reed type of frequency indicator is installed on the busses. Each outgoing feeder is protected by an aluminum cell lightning arrester of the latest design including charging resistances for arresters of all voltages. The oil switches are installed on the panel pipe supports, 5 in. behind the board. They are non-automatic for the generators, and automatic with secondary transformer trip coils for the feeders and motors.



Principal Features of the Piping Layout

The alternating current instruments are of the horizontal edgewist type, wattmeters and power factor indicators, operating on the well known direct-reading dynamometer principle. The ammeters and voltmeters are on the inclined coil magnetic vein principle. The direct current instruments are of the D'Arsonval type.

Aside from the main switchboard at No. 9 shaft, there are auxiliary boards at both Hecla and No. 11 mines, each of three panels, and controlling the motor generator sets and the direct feeders supplying power to each of the two operations.

All the direct current equipment is of a single polarity controlling a negative grounded system. Circuit breakers are installed on the negative side of the generators, and the positive side of the feeders, thus providing complete protection from short circuits, wherever they may occur.

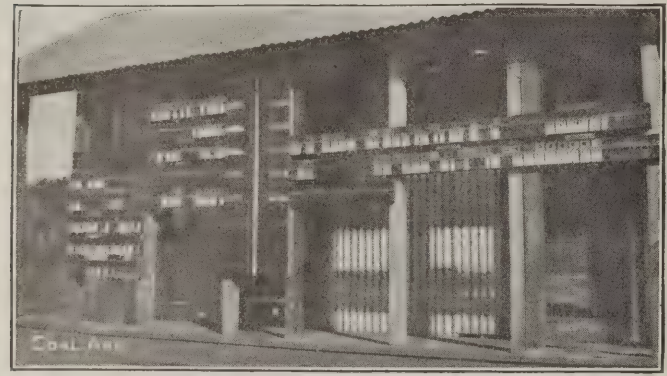
Since in the installation of this plant, conditions were encountered which were new to this field, Mr. T. M. Means, of the Randolph-Means Co., of Pittsburgh, Penn., was retained as consulting electrical engineer.

Identification Check Board

The Northwestern Improvement Co. has just installed at its Mine No. 7, Cle Elum, Washington, a new check board which is particularly suitable as a system of identification. It is in reality a representation of the mine. The central position of the board shows the main slope, manways and return airways. Travelingways are painted yellow, and return airways, red.

The levels are marked, on either side of the slope, and arms are projected therefrom, on which the miners' check numbers are hung. These arms are marked in subdivisions to correspond with the several batteries and blocks by which the level is being worked, and these subdivisions are further marked to designate the rooms which are being worked.

A blue enamel check with the miner's number thereon is left on the board at all times, and a brass check which the miner takes with him into the mine, hangs over it. No miner or company man can enter the mine without his check. By this system it is easy to tell how many men are working in the mine, and where they are distributed. If a miner changes his working place, the blue check corresponding to his check is transferred to the proper place on the board.



Showing Check Board at a Washington Mine

No part of the mine is designated upon the check board except those parts where men are working, and no numbers are hung upon the board except those numbers under which men are working.

Several short arms to one side of the main board are used for company men's checks. In case any of the checks are not hung upon the board when the miners come out from work, the foreman is supposed to ascertain whether the men are still in the mine, and if so, institute a search for them immediately.

Considerable confusion could arise in case the men do not coöperate with the management and obey instructions regarding the taking out and returning of their checks, but when they come to realize that it is to their interest to have such a method of knowing they are safe, they will not fail to do their part, just as they expect the management to do when things go wrong.

⁂

The Evans Mining Class

The mining class, in charge of Evan W. Evans, mine superintendent, D. L. & W. Coal Co., Scranton, Penn., has opened its fall term under auspicious circumstances. The class has a present enrollment of 25 members, representing all classes of mining work, among which are numbered the following: Mine machinist, pipeman, timberman, pumpman, footman or cager, driver-bosses, drivers, barn-boss, oiler, car-runners, surveyors, firebosses, miners and laborers.

The class has been growing in popularity each year, and much credit is due Supt. Evans for the disinterested effort he has put forth to teach the principles of mining to men anxious to learn. Mr. Evans has the hearty congratulations of Coal Age in this work.

OUTCROPPINGS

To some men every day is a holiday.

⁂

He who knows but little tells it quickly.

⁂

Laziness has no advocate, but many friends.

⁂

Have money in your head, but not in your heart.

⁂

The successful man generally has more ballast than sail.

⁂

Knowing a thing is nothing unless another knows you know it.

⁂

Some men go to work like a balky mule and quit like a high-speed hoist.

⁂

The man who starts out with the intention of doing no more than his part is apt to be satisfied with doing only a part of that.

⁂

Except for a scarcity of men, the possibility of a car shortage this fall and a strike next April, together with the new Pennsylvania tax on anthracite and a few other minor things, the coal operator has nothing to worry about.

⁂

A recent government publication states that "Alaskan coal fields continue to be undeveloped, according to the United States Geological Survey." A Western paraphrase of the above statement would probably be: Alaskan coal fields continue to be undeveloped because of the United States Geological Survey.

⁂

Apropos of a recent decision of the New York Court against the anti-smoke laws, a correspondent in the New York "Times" writes: "* * * * However turn on the smoke and the grime and the sulphur fumes; it is unconstitutional and unreasonable to interfere with anybody's business conducted at the smallest expense to the parties conducting it, and the rest of us be damned."

COMING SOCIETY MEETINGS

The Coal Mining Institute of America will hold its winter meeting at the Fort Pitt Hotel, Pittsburgh, Penn., Dec. 4 and 5. C. L. Fay, Wilkes-Barre, Penn., is secretary.

The Rocky Mountain Coal-Mining Institute has decided to postpone indefinitely the November meeting which was booked for Denver. This decision is due to the serious strike situation which now exists in Colorado. F. W. Whiteside, Denver, Colo., is secretary.

West Virginia Coal Mining Institute will hold its winter meeting at Charleston, W. Va., on Dec. 8, 9 and 10. Neil Robinson, Charleston, W. Va., is president; E. N. Zern, Morgantown, W. Va., is secretary.

Illinois Mining Institute will hold its next regular meeting in East St. Louis, Nov. 22, beginning at 9:30 a.m.; two sessions will be held, morning and afternoon. All who are interested in mining are invited. Applications for membership can be had by writing the Secretary-Treasurer, Martin Bolt, 1526 So. College St., Springfield, Ill. Headquarters will be at the Illmo Hotel. Meetings will be held in the City Hall.

EDITORIALS

Where Responsibility Is Lacking

Anthracite operators and labor leaders alike are puzzled over the serious situation which confronts them in the anthracite-coal fields of Pennsylvania. In the first year since the signing of the four-year agreement between the anthracite mine workers and anthracite operators on May 20, 1912, there were more strikes, more losses in wages and more losses in business than in the whole nine years of the previous agreements, and the trouble is continuing up to the present time.

Figures covering the first year of the existing contract, gathered from all operators, show that there were 165 separate strikes which involved 139,486 men and cost the various collieries at which they occurred 312 days of work. These figures show further that the loss in wages to the mine workers during the year on account of these numerous strikes aggregated $886,327.92, and the loss in output from the mines amounted to 613,756 tons.

The appointment of local grievance committees, so eagerly urged by the mine workers and the labor leaders who represented them at the conference with the operators last year has proved fruitful of more strikes than any other cause. The men seem to have forgotten entirely their obligation to remain at work and subject their grievances through the proper channels to the Conciliation Board if they cannot be settled locally. It is even more discouraging to the operators that the promises and efforts of the labor leaders themselves are equally unproductive of results in the shape of continuous work.

Month after month there has been a series of "button strikes," which is simply another way of saying that, agreement or no agreement, union mine workers will not go into the mines with mine workers who are not wearing a union button. The operators have made every effort to emphasize in the minds of the men the section of the award of the Anthracite Coal-Strike Commission, which specifies that there shall be no discrimination against or interference with any person on account of membership or non-membership in any labor organization, and have printed it in half a dozen languages and posted it at the collieries. But according to them, the mine workers do not even seem to be informed of the provisions of the agreement entered into in their behalf by their representatives, in spite of the fact that this agreement was formally ratified at a general convention of the mine workers at Pottsville, Penn.

It is such examples of union domination that make mine owners in nonunion fields so determined in their resistance to the encroachments of the Mine Workers' organization. West Virginia operators, for instance, would never have fought so bitterly in their recent struggle if they had not known how union supremacy has practically bankrupted the industry in Illinois. Operators in the latter state today are principal actors in financing the fights of the United Mine Workers in Colorado and elsewhere.

There is no question but that when present anthracite agreements expire, the operators in the hard-coal field will refuse to enter into further contracts with the miners' union, unless there is some guarantee that the men will abide by the terms of their agreement. The menace of unionism today is its irresponsibility.

⁂

Labor Leaders Sentenced to Prison

We are often forced to the conclusion that Canadian courts are more fearless and less sentimental in meting out justice to those who violate the law than are similar tribunals in the United States. In this country politics often reaches as high as the judge, and as a consequence, the administration of good government is thwarted. The recent judicial action at Nanaimo, B.C., whereby a number of rioters were sentenced to the penitentiary, is a case worthy of attention of all those who advocate proper punishment for the law-breaker, no matter whether he masquerades under the guise of a union labor leader or a trust official. Justice is not justice, unless it can reach in all directions with equal effectiveness.

On Aug. 11 and 12, serious riots occurred at Ladysmith, B. C., where a number of mines are located. Arrests followed, and those who were taken into custody pleaded guilty. On Oct. 23, after a lengthy trial of the cases, Judge Howay sentenced the strike leaders to two years in the penitentiary. One of the men, Taylor by name, is vice-president of the British Columbia Federation of Labor, and vice-president of the Ladysmith local of the United Mine Workers of America. Samuel Guthrie, a second offender, is president of the local chapter of the Miners' Union.

In passing sentence on these men the judge remarked:

> It is the custom when sentences are given that the judge make but little comment thereon, but in this case I am going to depart from the usual custom, for these cases are out of the ordinary, and call for a few remarks from me.
>
> This was not an ordinary riot. It was not a sudden ebullition of pent-up feeling, but it shows all down the line a deliberate scheme, a design from one end to the other. The riots at Nanaimo, South Wellington, Extension and Ladysmith all for one purpose, were simultaneous and carried out with one line of action. Bombs were thrown, property destroyed and peaceful citizens made to flee for their lives, and a persistent state of terrorism indulged in. After the bomb-throwing at the Temperance Hotel, parades were formed, evidently for the purpose of showing your numerical strength, and that you were in charge of the situation.
>
> Your counsel knows there is no more sympathetic man than myself, one ever ready to extend mercy, but I have read over all the depositions and find but little mercy you have shown. I read that the homes in which there was sickness were not free from missiles which you threw, and that little children hid in cupboards and under beds to escape rocks thrown upon them in merciless fullisade. The only mercy shown was the mercy of God.
>
> I was appealed to on behalf of your wives and children, but what do I find here? I find your women singing "Drive the scabs away," and throwing rocks themselves, and these actions take away much of the strength of the appeal for mercy on your behalf because of your women. The evidence shows not only that you have been rioting, but that a far more serious charge might have been laid against you.
>
> I recognize I have a duty to perform, painful in the extreme, but the law-abiding people in this community must be protected and punishment meted out, so that there may be no further occurrence of these lawless riots.

When our American courts learn to fulfill their duty in the same spirit of fearlessness and fairness, shown by Judge Howay, the strike-riot will cease to be an effective argument in the settlement of labor troubles at coal mines. We all should be ashamed of a civilization that will not accept some system of common-sense arbitration in preference to methods, based on violence and bloodshed.

⁂

The Mine Cave Problem

The mine-cave problem, in Scranton, Penn., has recently assumed an interesting aspect, at least as viewed from a philosophical standpoint. With all justice to the large coal corporations operating in and about that region, it must be said that the stolid indifference of the management has at last aroused the merited indignation of the people whose property and lives are endangered by their greed, to a pitch that demands recognition.

The increasing menace to the surface rights and holdings, growing out of the unconscionable robbing of the pillars in the underlying mine workings, resulted first in the appointment of a so-called "Mine Cave Commission." After two years of patient waiting and endurance, the sufferers are asking the question: "What has the Mine Cave Commission done to relieve the situation and render lives and property in Scranton more secure?" This commission has been maintained at an annual expense of $7500, and further than making an extended investigation of the mine workings and reporting their condition, nothing has been accomplished of a tangible nature.

The feelings of the residents in West Scranton, who are the worst sufferers from surface settlement, are now wrought up to a pitch that compelled the Scranton Board of Trade, in defence of the business interests of Scranton, to take active steps looking to the adjustment of the conflicting interests of the respective owners of the surface and mineral rights. At a recent meeting of the board, the president, R. E. Weeks, referred to the mine-cave problem as "a danger that is overestimated by people out of the city and underestimated by many people in the city."

The entire question of liability for surface support in the extraction of the underlying coal has been very much confused by the fact that the principal surface holdings of residents in the city, have been acquired by purchase from the coal companies, who reserved the mineral rights, which reservation was made a clause of the deed to the surface, in each case. It has been claimed by the coal companies that the reservation of the mineral rights included the right to remove said mineral without liability for damage to the surface. This claim has received more or less support as being the logical result of purchasing surface property with such a reservation in the deed. It was claimed that the purchaser did so with his eyes open and in full knowledge of the possible results growing out of the extraction of the coal.

An important decision of the State Supreme Court, made recently, however, is more favorable to the surface holder. The Supreme Court has held that surface support is an inherent right of the purchaser. The grantor who owns in fee both surface and coal, cannot reserve to himself the inherent right of the grantee to surface support. If he attempted to do so, the court would restore those rights to the grantee.

This decision of the Supreme Court is in direct line with the argument advanced editorially, by Coal Age, Nov. 9, 1912, p. 651, which reads as follows:

> It may be an unwritten law, as far as the mine-cave problem is concerned: but, has a purchaser any power to waive an inherent right on which the value of his purchase depends? Does the vendor give value for value when he demads such waiver? Is such a waiver binding, notwithstanding the fact that it is written in and made a part of the contract of sale? * * * * In all exchange it is binding on both parties alike to give value for value. * * * *
>
> It is a question whether there is a lawful exchange in a contract that contemplates the subsequent right of the vendor to damage the property that has become the rightful possession of the vendee. A waiver conveying such right would seem to have no legal or moral binding, because of its being contrary to the recognized and established principles of equity and justice.

We believe thoroughly in the inherent rights of the individual, which are as sacred as the constitutional rights of the citizen. It is a principle of law that such rights cannot be waived or bartered away at will by the individual, and a contract containing such waiver naturally has no standing in court. It has been suggested by some that, while it may be granted, that the clause in a deed, reserving the mineral rights underlying the property, is not binding and does not exempt the grantor from liability for damage to said property; a clause releasing the grantor from such liability and subscribed to by the grantee would be effective. We opine, however, as stated above, that such release or waiver is without force in law. We base this opinion on the fundamental principle of commercial interchange, which demands, value for value and permits no gamble on a purchase.

The waiving of the right to surface support by the purchaser of a property is equivalent to writing a contract that would menace the valuation of that property, for years to come. Admitting for the sake of argument that allowance is made in the purchase price for such possible deterioation of value, the fact remains that the lives of the dwellers on the surface is endangered by the writing of such contract; because, the release of the owner of the mineral rights, from just liability for damage arising from the extraction of said mineral, gives to him a free hand, by reason of which the stability of the surface is jeopardized to a greater degree than would otherwise be the case.

It is true that the possessor of mineral wealth is unable to realize on his possession unless he can take that mineral from Nature's storehouse. But the extraction of the mineral must form a part of the consideration in determining its value and such extraction must not entail damage to adjoining property. The value of such mineral in place is necessarily affected by the paramount condition of its availability.

The large coal corporations operating at Scranton and elsewhere, are, we believe, too wise and broad minded to attempt to dodge the issue. We believe the management will eventually meet the surface dwellers and make an equitable adjustment of their conflicting interests. In this way only can the coal industry thrive. We believe the refusal to come to such an equitable understanding and adjustment of claims could only result in dishonor to the great coal industry.

The Mine Cave Commission should at this time exert themselves and prove their efficiency as a commission appointed in the interests of the people and the great coal industry that dominates not only Scranton but the entire anthracite valley.

SOCIOLOGICAL DEPARTMENT

Technical and Industrial Education

By H. V. Gummere*

Everyone who has studied the subject at all knows the intimate relation between the industrial standing of our country and the knowledge and the efficiency of those engaged in its industries. While this relation holds for all, from the humblest unskilled operative up to the corporation manager, it seems especially important to have those in the lower places realize it, since their educational opportunities are certain to have been the more limited. Thousands of boys yearly leave the lower grades in schools to go to work. To most of these will come later a keen realization of lost opportunities and the absolute necessity of making up for them, for they enter commercial or industrial occupations utterly unfitted for advancement to higher positions.

What they can do, how well their capabilities can be developed, will, in most cases, depend on what possibilities their employer brings to their attention and makes available. Most employers are well aware of this and try to help those who work for them to find ways of gaining the knowledge they need. Experience has shown that this pays merely as a business proposition. A young fellow whose character and habits of life are known, whose personality and ability have been tried out, is usually much to be preferred to any stranger when appointments are made to positions of large responsibility.

Objections to Institutes and Corporation Schools

Associations or clubs, whether local or branches of a national body, which meet periodically to hear an address or participate in a discussion are at best educational only in a supplementary way. Any study done in connection with them is not consecutive and usually to be beneficial needs a foundation which is too often lacking. The corporation school is rather new, and for every corporation large enough to organize and conduct one, has interesting possibilities; the tendency, however, is always to train for immediate usefulness in detail rather than in broad principles, while the variety of courses which can be offered is bound to be small. If, for example, the school is organized to benefit the workers in the shop, what shall be done with those in the business office who need an entirely different training?

A correspondence school, either within the corporation or outside its control, offers the only means of systematic study for those residing at considerable distance from the large centers of population, or where the number of persons interested in a given kind of work is too few to warrant the formation of a regular class. When schools can be reached where experienced teachers are in charge, where direct recitation methods are used, and where a variety of courses can be offered in a systematic way, the establishment of regular classes in off-duty hours offers the best method of giving the desired instruction. These usually take the form of night schools or evening classes.

Advantages of Night Schools

Night schools have flourished in the last 20 years wherever established. Their advantages are fully recognized by those who have been attending them. Such are: Immediate help over difficulties, procured by having an instructor at hand; the opportunity to learn by the mistakes of others in the class; compulsory regularity in study, so important even to a very earnest student; the stimulus of numbers; the desire of each student to stand well in his class; the possibility of drill; and many others. Such school work, offered not only in the evening, but in the late afternoon as well, is likely to have a remarkable growth in the future.

Some Unanswered Problems

To the general public the work which is being done as regards both scope and quality remains practically an unknown quantity at the present time. Employers are just waking up to what has been and can be done in this way. No matter what educational agency is used, a number of problems arise which can be solved only by the coöperation of employers, employees and teachers. What courses are needed? How much time can be required of busy men for school work? What fees are suitable? How shall those be accommodated who have long distances to travel and high carfares to pay? Should classes be established in locations remote from the schools, in shops or in offices, but under the control of their trained faculties? These are some of the problems which have never been fully answered. The answers would probably differ with a change in locality. Other questions are almost wholly the concern of the employer, such as: What school and what kind of education can best help my employees to gain what I want them to know? Which of them can profit most by systematic school work? How can I help them to get it?

A Conference on Industrial Education

The only satisfactory way to reach a conclusion on these matters is to have some common meeting ground for all interests where free discussion can have full play. In Philadelphia steps to this end have already been taken. Last spring representatives of the Central Educational Institute of the Young Men's Christian Association, Drexel Institute, the Franklin Institute, School of Industrial Arts, Spring Garden Institute, Temple University and the Wagner Free Institute of Science, joined with representatives of the Philadelphia Trades Schools and the Philadelphia and Camden Public Schools in arranging meetings for the purpose of becoming acquainted with one another's work and the educational problems employers have to face.

Wishing to avail themselves of the wide resources of the Public Education Association of Philadelphia, members of the faculties of the participating institutions are now organizing a section of that association to be known as The Industrial and Technical Education Conference of the Public Education Association. The membership is to consist of educators and employers, and the purpose is to seek earnestly the solution of the problems arising from the needs of the vast numbers of young people who have never had proper opportunities for securing that knowledge which will pave the way to better service and higher responsibilities.

---

*Secretary, The Industrial & Technical Education Conference of the Public Education Association of Philadelphia, Penn., 1015 Witherspoon Bldg., Philadelphia, Penn.

It is hoped that the movement thus started will spread to include not only local representatives, but all those employers whose employees find in the large cities opportunities which cannot be offered nearer. This means extending the work to a great many miles from Philadelphia, for classes could easily be arranged outside the city, managed by experienced teachers who are specialists in any given line of instruction.

The Panther Valley Mining Institute Banquet

The second annual banquet of the Panther Valley Mining Institute was held in the Armory at Tamaqua, Penn. on Saturday evening Oct. 18. Although the night was rainy and exceedingly disagreeable, between 300 and 400 members of the institute and guests were present.

After a season of gastronomic activity, which was thoroughly enjoyed by all in attendance, W. J. Whildin called the meeting to order and made a few remarks upon the progress which had been made during the past year.

The Panther Valley Mining Institute is an organization for men and boys which has for its object (1) To advance the welfare of the men employed in and about the mines in the anthracite coal fields, and (2) to advance the interests of the mining industry itself.

To accomplish this end schools have been organized holding their sessions upon two evenings each week. In addition to this, regular meetings of the Institute are held from time to time when papers are presented upon subjects pertinent to mining, and calling out discussions upon various mining subjects.

During the past year these meetings were held each month, and the papers read covered such objects as "First-aid Work," "Mining," "Ventilation," "Method of Mining the Mammoth Vein," "Transportation," "Electric Haulage," and the "Geology of the Panther Creek Valley." Last year there was a total enrollment in the schools of 86, and an average attendance of 46. There were four departments in these schools; the primary, the mining, the electrical, and the mechanical departments, all well patronized, the electrical and mining being probably the most popular. An idea of what this school is doing for the men may be gained from the results obtained in the mining department. Fifteen members of the class in mining this spring took the examination for mine foreman's and assistant mine forman's certificates. Every one of the fifteen passed. Not only this, but the mine examining board stated that these men's papers were the best they had ever read. Futhermore, seven out of the fifteen are now filling positions and have filled them during the past several months as a result of their being able to qualify and having these certificates.

Although any one, regardless of where or by whom he may be employed, may become a member of this Institute and attend its school and meetings, the membership is nevertheless made up very largely of employees of the Lehigh Coal & Navigation Co. This firm, therefore, knowing that an educated man is much more efficient than an ignorant one, does all in its power to promote the welfare and encourage the membership of the Institute.

After Mr. Wildin's remarks, speeches were made by Edwin Ludlow, vice-president of the Lehigh Coal & Navigation Co., S. D. Warriner, president of the same company, Prof. Preston Lambert, of Lehigh University, and George M. Roads, attorney-at-law.

All of these gentlemen spoke of the universal regard for the man who, whatever his station in life might be, had the ambition and the stamina to rise through the improvement of his mental facilities to a higher plane in his work and in the community. Mr. Roads called particular attention to the miner's sturdiness of character and persistence of purpose in time of need which was well portrayed in the words of the Institute Song which had just been sung:

> "When their comrades are in danger,
> Without thought of praise, or gain,
> The faithful boss and miner
> At their posts will all remain."

A Motor Ambulance for Colliery First Aid

An ambulance car for colliery purposes has recently been built at Doncaster, England. It is made from kiln-dried birch, varnished natural color. The inside of the body is made smooth so that it can be readily cleaned. The equipment consists of two collapsible stretchers of the St. John Ambulance Society type, fitted with telescopic handles and included in the ambulance equipment are two sets of splints, liniment, bandages, hot-water bottle, etc. Immediately behind the front windows is an moveable seat for an attendant.

The ambulance is lighted inside by electricity and special provision is made for ventilation by means of louvers over the main windows which are controlled from the inside by shutters. Folding steps are provided at the rear. They are made very wide and have broad treads so that the entrance to and from the ambulance is as easy as possible. Two large doors are fitted at the rear with the same idea in mind. The springs on the vehicle are extra long and are provided with shock absorbers, the shelves being covered with seat cushions and the stretchers placed under them, thus making it possible in an emergency to take the members of the rescue brigade from one colliery to another.

The chassis is fitted with a 15.9 hp. engine having four cylinders cast in pairs with a bore of 80 mm. (3.1 in.) and a stroke of 130 mm. (5.11 in.). Thermo-siphon cooling is used; all valves are enclosed; the tappet valves are adjustable, the bearing surfaces are of ample dimensions, and are white-metalled. The lubrication is by forced feed, four speeds and reverse are provided and the chassis frame is specially constructed of a suitable length, the rear axle being of special strength and worm driven. Every attempt has been made by Messrs. E. W. Jackson & Son, of Doncaster, England, the constructors, to produce an easy riding vehicle adapted to the special purpose for which it is designed.

Lackawanna Steel Co.'s Contest

In remarkably realistic tests the 30 first-aid teams of ie Ellsworth Collieries Co. demonstrated to an assemlage of nearly 5000 people on Friday, Oct. 17, the methds to be followed after an explosion or other accident icident to the mining industry.

The towns of Cokeburg and Ellsworth observed a oliday, and the residents of the towns as well as the hool children witnessed the exhibition.

A procession of 880 scholars from Ellsworth and Cokeurg schools passed in review before those assembled nd were given a great ovation. Each of the rescue firstid teams then performed in the open field, and after ompleting its exhibition reported to the field hospital i charge of Drs. French, Rote and Kirby, and then the ommissary department of the company served a lunch hich had been prepared by the domestic-science pupils f the two schools.

Then followed an explosion in an improvised mine iat had been constructed of brattice cloth the width and eight of an ordinary gangway. Men supposed to have een overcome by fumes and smoke were carried from the iine by the helmetmen, the first-aid men reviving them ith respirators and pulmotors. The rescue men entered ie mine which was 200 ft. long, with a life line. A umber of men belonging to a rescue team were reprented as being caught in a fall of timber and other ébris and a rescue was effected.

The judges of the work of the teams were Dr. C. C. ans, of Uniontown; Dr. A. E. Baer, of Uniontown, and r. Geo. Hayes, of Monongahela.

D. L. & W. First-Aid Meet

Employees of the Delaware, Lackawanna & Western R.R. Coal Department, working in such of their mines as are situated between the Pettebone and the Nanticoke collieries, articipated in an interesting first-aid contest at the Nanticoke State Armory on Mitchell Day, October 29, in the presence of a large number of spectators, the contestants making an admirable showing.

The events were as follows:—

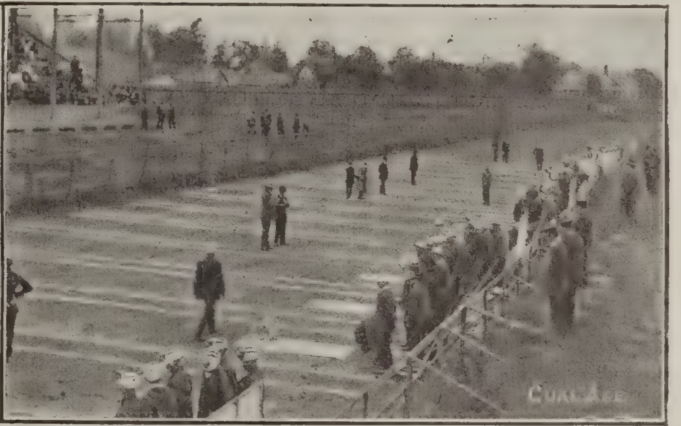
One-Man Event—Man has been overcome by gas in a low place, and has become unconscious. On falling he received a blow on the right temple. Drag him 10 ft. out of gas, and carry him 50 ft. and administer artificial respiration for one minute. This work to be done as you would do it in the mine.

Two-Man Event—Compound fracture of the left collar bone and fracture of the jaw. (Barton bandage.)

Full-Team Event—First. Gas burns on face, hands, arms and body. Second. Fractured ribs on left side, and fracture exposing ulna bone. Third. Compound fracture of left leg 6 in. below the knee, and simple fracture of right upper arm. Fourth. After a fall of rock the patient is found with the following injuries: Simple fracture of right forearm, both bones; severe cut in palm of left hand, bleeding in jets; simple fracture of left leg, 4 in. above the knee, and lacerations of the head.

The one-man event was won by William Jones, of the Bliss Colliery, who was awarded a gold signet ring. The two-man event was won by William L. James and David J. Williams, of the Truesdale. Both were given watch fobs. The full team event was won by No. 1 and 2 shaft team, of the Truesdale. The best general average was made by the Bliss colliery team, of which the captain is William Hill. The individuals in this team each received a prize consisting of a first-aid outfit.

The Jellico Creek Team Ready to Demonstrate



How the Field Was Arranged for the Contest

The Steel Explosion Gallery Used to Exhibit the Effect of Replacing Black Powder by Permissible Explosives

Scenes at the Knoxville Meet

The meet held by the Association of Tennessee Mine Foremen, the Bureau of Mines and the American Red Cross, at Knoxville, was skillfully planned. It will be noted how methodically the grounds were marked so as to place the teams without confusion. The canon used at the Pittsburgh meet in 1911 was set up at Knoxville and again proved the superiority of permissible explosives. This exhibit was the first of the kind held in the South and a committee was formed to examine the powder, the coal dust, the clay and the loading of the cannon. The precautions taken by this committee served more fully to convince the miners that coal dust is dangerous even when gas is not present.

DISCUSSION BY READERS

Starting Fan after Explosion

Letter No. 7—An experience of nearly 40 years in coal mining, eight-tenths of which has been in an official capacity, has made me deeply interested in the welfare of miners. Having engaged, many times, in mine-rescue work, following explosions and inundation of the workings, I am particularly interested in whatever pertains to such work.

An explosion in a mine results in the loss to the operator, not only of his workmen but also of much of the mine equipment. The one makes it difficult for him to again operate under the same favorable conditions, as before, even when he has repaired the damage done to the mine and its equipment. The other may have crippled him financially, or so embarrassed him that he must operate at a great disadvantage, for a long time to come.

In the rescue work in which I have engaged, it has always been my experience that the fresh-air current is of the first importance. In most of this work, we did not have the help of oxygen helmets, or any other breathing devices. Were it not for the fresh-air current that we carried with us into the mine, we could not have survived. The work had to be done with care and caution. The logical way is to consider the surroundings of the zone in which the explosion has occurred. The mine foremen and his assistants are the men who are or should be acquainted with the conditions existing in the mine. Briefly, the questions to be considered are: Was the mine free from gas and dust, in a general way? Was the mine a dry and dusty one? Was the mine damp or very wet?

My experience has proved that the answer to these questions are of the greatest importance to the men who are to undertake the work of rescue, and who must decide the question of whether or not the fan should be started immediately after the explosion. Human life may depend on this decision. In answering the question in reference to starting the fan as quickly as it can be repaired, let us consider different conditions.

1. Assume the mine generates some gas and is dry and dusty. In this case, whether the fan is blowing or exhausting, it would be better to explore the mine a certain distance at least, to ascertain, as far as possible, its condition. The information thus gained would enable you to arrive at an intelligent decision. If fire exists in the mine, this should be extinguished before starting the fan.

2. The mine may be divided into two sections—rise and dip workings. If the dip workings were damp or wet, so that pumps were required to keep the places dry, I would have no fear in following the air current as we restored the ventilation by repairing the doors and stoppings in that section The rise workings would be more dangerous to penetrate and great caution would be required in attempting to explore them.

In case electricity is used in the mine, it would be important to have the current shut off promptly to avoid the danger of the ignition of gas that is accumulating in the mine. The question of starting the fan would depen on the conditions I have named, and experience mus be the guide.

Adelaide, Penn.

⁂

Collapsible Stoppings

Letter No. 8—I have been greatly interested in th discussion of this subject in Coal Age, but have not bee converted to the idea of building such stoppings in mines The first consideration is to make the mine safe for work Whether the mine is gaseous and liable to a dust explosion, or whether the mine may be considered as practically safe from the explosion of gas or dust, does not, t my mind, alter the question.

In my opinion, all stoppings should be built in th center of the crosscut where they will be most protected They should be constructed of incombustible material an built in a manner to stand all shocks incident to coa mining. If possible, the strength of the stopping shoul be such that it will withstand the force of a small loca explosion.

It is important in building stoppings to start th foundation on the solid rock floor; and not, as I hav often seen done, leave two or three inches of dirt unde the walls. My reason for building a solid stopping o concrete, or stone or brick masonry is that this class o stoppings will maintain the circulation of the air bette and keep the working face more clear of gas, thereb making an explosion less liable to occur. A light collapsible stopping will necessarily leak air in a short tim owing to the settlement of the roof or of the stoppin itself. In case of a local explosion of gas or dust, suc permanent stoppings will not ordinarily be destroy and the rescue party will be able to enter the mine mor promptly and with less danger, because the air curren will still be circulating through the workings. Me working in such a mine would have a greater chance t escape than where the stoppings have been built ligh and are destroyed by the force of the explosion.

A. Miner.

Scranton, Penn.

⁂

The Safety Lamp and the Eyesight

I have been much interested in the numerous letter that have been published relating to the effect of th continued use of the safety lamp on the eyesight o miners; and noticed one letter from a brother miner, a Wylam, Ala., who claims that the continued use of th safety lamp is the direct cause of the disease known a "miners' nystagmus." While such a statement may b true, in some exceptional cases, I believe the fact is no proved, as there are other causes common to coal mining that may be responsible for the trouble.

My experience has led me to believe that the practic of "solid shooting" with black powder may be one caus of this trouble; especially where the ventilation of the mine is not the best and the atmosphere is full of powder smoke, for the most of the day. I remember some 30 or 40 years ago, this was the condition in the Belleville Track mine near St. Louis. The coal was shot off the solid with black powder, and the mine air was thick with powder smoke. As a result, the miners were much troubled with a continual winking of the eye, and many suffered from a burning feeling and weak eyes. On coming to daylight, they were like blind men. I remember that some who did not remain at the mine recovered, while others were not as fortunate.

Scotch and English miners suffer much from fires. Many are troubled with blisters on their eyes, caused from undermining and cutting hard seams of coal. They could not look steadily at a safety lamp or a naked light. I worked 15 years in Scotch mines and 45 years in mines in the United States, and have used the safety lamp for nearly 50 years, and have not found that its use has injured my sight, in the least degree.

The fireboss, in examining a place for gas must look steadily at the light of the lamp, and it seems to me would be in more danger of the light affecting his eyes than the miner who seldom looks at the safety lamp; but sets it 6 or 8 ft. away from his work and only gives it an occasional glance to see that it is all right. But, strange to say, I have never heard a fireboss of any experience complain that the safety lamp hurt his eyes.

In my opinion, the miner's eyesight is injured more by the semidarkness and the dust and smoke in which he must work. I believe that these conditions have as much or more to do with the generally poor eyesight of miners than the continued use of the safety lamp.

George Templeton Main.

Republic, Ala.

⁂

To Prevent Gas and Dust Explosions

The subject of the prevention of accidents to employees in a gaseous and dusty coal mine, is undoubtedly one of the most important in mining. By *important* I do not mean that there are more men injured and killed by explosions of gas and dust than from other causes incident to mining, although the public, at large, seem to be under that impression. The reason is that when men are injured or killed by falls of slate or coal, or some other mine accident, there is little heard of it; but should an explosion of gas or dust occur, in any part of the world, all the newspapers throughout the country are at once filled with big head lines "Another Mine Explosion," etc., giving the number of killed and injured. That is why I say this subject is an important one; because it is up to the officials of all coal companies, from the president down to the assistant foreman in the mine, to show the public that the coal-mining industry can be handled in a manner as free from accidents as any other business or industry.

Now, in the operation of a mine, the officials on the ground are and should be the men who should do their utmost to prevent accidents occurring; because the higher officials are not at the mine daily and are not, therefore, acquainted with the different conditions that constantly arise and which may cause the death or injury of one or more of their employees. The management lays down certain rules and gives general instructions how the mines are to be operated. If, however, mine officials—superintendents, mine foremen, assistant foremen and firebosses become careless, it will be difficult to convince the world that coal mines can be run without accident.

To prevent accidents to employees, from explosions of gas or dust, the most important consideration is the ventilation of the mine workings. In order to have good ventilation and to remove all obnoxious gases that the coal gives off, it is necessary, when opening a gaseous seam, to install a fan large enough to give sufficient air; and also to drive all airways large enough to make it possible to split the air current when needed, so as to ventilate each section separately, and do away with so many doors by building overcasts at the mouth of each section. Every foreman should see that the stoppings are put up in good shape and that no stopping is built under a drawslate, or any other loose slate. It is an easy matter for a foreman or fireboss to make his inspection and report everything in good shape; but while he is visiting some other section, possibly a piece of bad slate, which he did not notice, breaks down one of the stoppings and short-circuits the air. Then, perhaps, by the time the miners arrive at their working places, enough gas has accumulated to cause a serious explosion when it comes in contact with an open light, possibly killing every person in that split. Another important advantage in splitting the air current is that in case an explosion should occur, caused either by the negligence or carelessness of the foreman, or his assistants or otherwise, it will tend to confine the explosion to that section or split in which it occurs. There is no doubt in my mind but that nearly all accidents can be avoided if the mine foremen attend properly to their business.

About 17 years ago, I was a miner in a gaseous mine, in which open lights were used, and it did not take me long to find out that the seam was liberating a considerable amount of gas. After working for some time, I started to visit some of the workings in the section where I was working. I went into a room some 200 ft. in length, with an open light on my cap. I had proceeded up the room a hundred feet or more, when the miner at the face suddenly shouted, "Take that lamp off your head." I did so in a hurry and walked up to the face. The miner then showed me a chalk mark on a prop he had setting close to the face, showing how low the gas was found that morning by the fireboss. The chalk line was about a foot from the top. I gathered up my tools and left that mine in a hurry; as I came to the conclusion quickly that, some day, there would be an explosion there if things were not remedied. About two years later, the newspapers were filled with the account of an explosion that occurred in that mine, killing about 60 men. There is no doubt in my mind but that the fireboss' chalk mark kept coming down the post, till finally enough gas had accumulated to blow up the mine.

It is my opinion that all gases should be treated as dangerous; and no matter how slight the traces may be, men should be taught to treat them as dangerous. If all shotholes are properly charged, with a so called safety powder and properly tamped, the dust removed, and all precautions taken and rules carried out, we are certain to make a good showing during the year 1913.

United States Coal & Coke Co.

Gary, W. Va.

The Certificate Law

The article on The Certificate Law, by Charlton Dixon, Coal Age, Oct. 25, p. 604, is timely and very much to the point. Mr. Dixon says: "The certificate law, so prevalent in most mining states, practically confines men to a certain prescribed territory."

The coal fields of Tennessee and Kentucky furnish an apt illustration of the workings of the present law. The Tennessee coal lies principally in the eastern part of the state and in close proximity to the coal fields of southeastern Kentucky. These are, in fact, the same coal fields and are taken together to form what is known as District No. 19 of the United Mine Workers' Organization.

There are coal mines all along the border line dividing these two states. A man may hold a first-class certificate, allowing him to fill the position of mine foreman in Tennessee; but he cannot act in that capacity in an adjoining mine across the state line, without again going to the expense of another examination before another examining board in Kentucky. Likewise, a certified mine foreman in Kentucky ceases to be eligible to that position the moment he steps across the state line into Tennessee.

Mr. Dixon suggests that each state should incorporate in their statutes, some provision for honoring the bona-fide certificates of other states. I believe this is a good suggestion, but before that can be done, there should be an effort made to standardize the examinations held in the different states, in order to make them as nearly uniform as possible, in so far as they apply to the same position and practically the same conditions.

Not long ago, there was a man who took the examination in Tennessee and was awarded a second-class (Class B) certificate. A few years later, after a change in the administration of the state government and the appointment of an entirely new board of examiners, this man desired to go before the board and take the examination for a Class A certificate. In this examination, he failed to make a sufficient average to entitle him to even a Class B Certificate, which he already held under the previous examination.

This incident serves to illustrate the great difference in the examinations given in the same state, when the examining board is changed by a change of politics. In this connection, however, it may be stated that, in other professions and callings, certificates granted in one state are not good in another state. It would be well to have this question thoroughly discussed in Coal Age.

Study Course in Coal Mining

By J. T. Beard

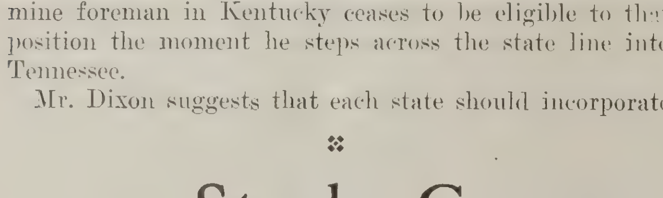
The Coal Age Pocket Book

WEIR MEASUREMENT

It is a common practice to measure the quantity of water flowing in a ditch or stream by constructing a weir similar to that shown in the accompanying figure, and allowing all of the water to flow over the weir. When a uniform flow has been established certain measurements are carefully taken and from these measurements the quantity of the flowing stream is calculated, in cubic feet per second, or gallons per minute, as desired.

Essential Points—In order to obtain fairly accurate results, it is important to observe certain conditions, which may be described as follows:

(a) The velocity with which the water approaches the weir called the "velocity of approach" must be reduced to a minimum; and to do this, the cross-section of the water in the weir or what may be called the "wetted area" of cross-section must be small in comparison with the area of the cross-section of the stream.



Longitudinal Cross-Section and Front View of Weir, Showing Important Dimensions

Referring to the figure, the wetted sectional area is represented by l × h = lh, and that of the stream by w (h + d). Good results are obtained when h does not exceed one-half d, and l does not exceed one-third w. The wetted area of the weir will then not exceed one-ninth of that of the stream, and the average stream velocity or velocity of approach will not exceed that proportion of the velocity of the water flowing through the weir.

(b) In order to avoid, as much as possible, the effect that an inclined surface would have to increase the velocity of the water flowing through the weir, beyond that due to the head h, the faces both back and front of the weir dam (ab) must be vertical; and to avoid any undue disturbance of the steady flow, the upper edge of the dam is beveled as shown at a, in the figure. As a further means of maintaining a uniformly steady flow that will represent more correctly the velocity due to the height h, the vertical sides (ss) are extended a short distance beyond the crest (a) of the dam. Also, the empty space (o) under the waterfall must be open at the sides, or, otherwise, a vacuous condition will be created owing to the partial exhaustion of the air by the falling water, which would act to increase the flow of water over the dam.

The Coal Age Pocket Book

Measuring the Head h—When the precautions mentioned have all been taken the velocity of the water flowing through the weir is practically that due to the height h or the vertical height of the surface level of the water above the crest (a) of the dam. To measure this height accurately a rod or gage (G) is usually set up in the stream a few feet above the dam. The rod is graduated in feet, the zero of the scale being level with the crest (a), as shown in the figure. To avoid the formation of ripples that would interfere with the accurate reading of the gage, the up-stream edge is beveled and the rod is made very thin.

Error Due to Velocity of Approach—Except in a still-water basin, the water at the gage always has more or less velocity (velocity of approach) for which allowance must be made if accuracy is desired. It has been shown by numerous experiments that when the velocity of approach does not exceed 1 ft. per sec. the velocity of discharge is equal to that due to the height h, within 2 per cent. of error.

Calculation of Quantity—When great accuracy is not desired and the velocity of approach at the entrance to the weir is small the quantity of water flowing through the weir may be calculated, in cubic feet per second, by the formula

$$q = 3\,lh\sqrt{h} \qquad (1)$$

in which q = quantity of water flowing (cu.ft. per sec.); l = length of weir (ft.); and h = vertical height (ft.) of level surface above edge or crest of weir.

When it is desired to make correction for the velocity of approach, that velocity can be closely estimated by dividing the quantity of flow, as calculated by formula 1, by the cross-section (lh) of the weir, which gives the formula for finding the velocity (v) of approach,

$$v = 3\sqrt{h}$$

It is then necessary to calculate the head h_1 due to this velocity, as follows:

$$h_1 = \frac{v^2}{2g} = \frac{(3\sqrt{h})^2}{2 \times 32.16} = 0.14\,h$$

The head h_1, calculated as producing the velocity of approach, must then be added to the head h, as measured by the gage, to obtain the total head (H), which is, approximately, the actual head producing the flow through the weir; thus,

$$H = h + h_1 = h + 0.14\,h = 1.14\,h$$

The quantity of water passing over the weir is then found by substituting this total head H for h in formula 1; thus,

$$q = 3\,lH\sqrt{H} = 3.65\,lh\sqrt{h} \text{ cu.ft. per sec.}$$

This last formula is practically correct for finding the approximate flow of water over a weir constructed according to the diagram shown in the accompanying figure.

The following formula is derived from the above and expresses the quantity of water flowing through the weir, in gallons (G) per minute.

$$G = 1640\,h\sqrt{h} \text{ gal. per min.}$$

EXAMINATION QUESTIONS

Examinations for Mine Manager, Mine Examiner and Hoisting Engineer, Held at Springfield, Ill., Sept. 8, 1913

(Selected Questions)

Ques.—An entry is parallel to a land line and 150 ft. from it. If the rooms turned off the entry run at an angle of 45 deg. with the entry; what distance can they be driven, allowing a barrier of 10 ft.?

Ans.—Deducting the 10 ft. for the width of the barrier pillar leaves 150 — 10 = 140 ft. of coal to be taken out between the entry and the barrier. The length of each room measured on the straight rib is 140 ÷ sin 45° = 140 ÷ 0.707 = 198 ft. This measurement is taken into the extreme corner and the face of the coal must then be kept parallel to the entry. If, however, the face of the room is squared with the track, the length will be less by an amount equal to the width of the room. Thus, for a room 24 ft. wide, the distance from the entry to the face would be 198 — 24 = 174 ft.

Ques.—What are the uses of the following instruments, in connection with coal mines: the anemometer, thermometer, barometer and water gage?

Ans.—The anemometer is used to ascertain the velocity of the air current, in feet per minute. The thermometer is used to find the temperature of the air current and the mine air, at different points in the workings. The barometer indicates the pressure of the atmosphere, in inches of mercury column. The water gage shows the difference of pressure between the fan drift and the atmosphere, or between the intake and return airways, at the point where the observation is taken. It indicates the ventilating pressure inby from that point, measured in inches of water column.

Ques.—What diameter of cylinder will be required to develop 50 hp., in a noncondensing engine that has a stroke of 4 ft. and makes 45 r.p.m., when working under a mean effective pressure of 30 lb. per sq.in.?

Ans.—Since the engine makes two strokes for each revolution, the piston travel is 2 × 45 × 4 = 360 ft. per min. Fifty horsepower is equivalent to 50 × 33,000 = 1,650,000 ft.-lb. per min. To develop this power at a speed of 360 ft. per min. will require a total pressure on the piston of

$$pa = \frac{1,650,000}{360} = 4583+ \textit{ lb.}$$

For a mean effective pressure of 30 lb. per sq.in., the required area of the piston or cylinder is

$$a = \frac{4583}{30} = 152.77+ \textit{ sq.in.}$$

The required diameter of the cylinder is, then,

$$d = \sqrt{\frac{152.77}{0.7854}} = 13.94, \textit{ say } 14 \textit{ in.}$$

Ques.—Describe a synclinal and an anticlinal axis, respectively.

Ans.—A "syncline," in geology, is a trough or valley formed by the dip of the strata toward the same line, which is the axis of the syncline or the "synclinal axis." In distinction from this, an "anticline" is a ridge from which the strata dip away on each side. The ridge line or a line parallel thereto and symmetrical to the sloping strata on each side is the "anticlinal axis."

Ques.—With a fan developing 30 hp. and a water gage of 2.3 in., if only 50 per cent. of useful effect is obtained, what quantity of air would be produced?

Ans.—The useful effect being 50 per cent., the power on the air is 0.50 (30 × 33,000) = 495,000 ft.-lb. A water gage of 2.3 in. corresponds to a ventilating pressure of 2.3 × 5.2 = 11.96 lb. per sq.ft. The quantity of air in circulation is then calculated as follows:

$$q = \frac{u}{p} = \frac{495,000}{11.96} = 41,388 \textit{ cu.ft., nearly}$$

Ques.—The anemometer indicates a velocity of the air current, of 200 ft. per min., in an airway 5x8 ft. and 4000 ft. long. Calculate (a) the quantity of air passing per minute; (b) the pressure in pounds per square foot; (c) the water gage; and (d) the horsepower on the air.

Ans.—(a) The sectional area of the airway is a = 5 × 8 = 40 sq.ft. Assuming the indicated velocity is an average velocity for this airway, the quantity of air in circulation is

$$q = av = 40 \times 200 = 8000 \textit{ cu.ft. per min.}$$

(b) The rubbing surface of the airway, assuming that the given length includes the return, is s = 2 (5 + 8) × 4000 = 104,000 sq.ft. The ventilating pressure is, then,

$$p = \frac{\kappa s v^2}{a} = \frac{0.00000002 \times 104,000 \times 200^2}{40}$$

$$= 2.08 \textit{ lb. per sq.ft.}$$

(c) The water gage is 2.08 × 5.2 = 10.8+ in.

(d) The horsepower on the air is

$$H = \frac{qp}{33,000} = \frac{8000 \times 2.08}{33,000} = 0.504 \textit{ hp.}$$

Ques.—Show by figures how to calculate the quantity of air passing in an entry 6 ft. high and 10 ft. wide, the velocity of the air current being 600 ft. per min.

Ans.—The sectional area of this airway is a = 6 × 10 = 60 sq.ft. The quantity of air passing is, then,

$$q = av = 60 \times 600 = 36,000 \textit{ cu.ft. per min.}$$

Ques.—If 10 hp. gives 20,000 cu.ft. of air per minute, in a certain mine, what horsepower will be required to produce 45,000 cu.ft. in the same mine?

Ans.—Assuming there is no change in the efficiency of the ventilator, the power varies as the cube of the quantity, or the power ratio is equal to the cube of the quantity ratio. Thus, calling the required horsepower x,

$$\frac{x}{10} = \left(\frac{45,000}{20,000}\right)^3 = \left(\frac{9}{4}\right)^3 = \frac{729}{64}$$

$$x = \frac{10 \times 729}{64} = 113.9 \textit{ hp.}$$

COAL AND COKE NEWS

Washington, D. C.

An interesting decision has been announced by the Interstate Commerce Commission regarding the case of the "Lebanon Commercial Club vs. the Louisville & Nashville R.R. Co. et al," which related to the local rates for the transportation of bituminous coal in carload lots from mines located on the Louisville & Nashville R.R. in Virginia and Tennessee, these being less to Louisville than to Lebanon, an intermediate local point 67 miles nearer to the mines than Louisville. Complaint was also made because the rates varied according to the grade of the coal while the rates to Lebanon were not varied in this way.

The commission now holds that as the rates to Louisville are influenced largely by the movement of bituminous coal over the Ohio River and by competing rail carriers the lower and varied rates to that point have not been shown to be unjustly discriminatory as against Lebanon.

In dealing with this case some interesting points were developed, notably the general question with reference to the proper method of treating points which enjoy water connections and which are more or less competitive with other points that do not enjoy such connections. In speaking of this matter, the Commission, in the decision referred to, says:

> The complainant admits that Louisville's position on the Ohio River, and as a railroad center, operates to give it rates which Lebanon may not reasonably claim. But it is insisted that these advantages do not warrant the existing differences between Louisville and Lebanon rates, and that the same should not exceed 15c. per ton. This particular figure, however, is merely the conclusion of the complainant's rate expert. The Commission finds the record quite bare of anything that will enable it to determine the extent to which the Lebanon rate should be allowed to exceed the Louisville rate. It must also be remembered that any change which may be made in the existing differential will necessarily reflect into the rates to other Louisville & Nashville points, intermediate, as is Lebanon, to Louisville. Under all these circumstances, it is the view of the Commission that final action on the fourth section element of this petition should await the disposition of the Louisville & Nashville R.R. Co.'s Fourth Section Application No. 1952, and also the construction of the fourth section to be made by the Supreme Court in cases now under submission.
>
> The only question remaining is whether or not there is discrimination against Lebanon, because its rates are not varied according to the grade of the coal, as are the rates to Louisville. Complainant contends that a number of years ago Lebanon enjoyed such rates through the medium of a tariff provision which granted a 30 per cent. refund from the published rate when the coal was used for steam purposes.
>
> The defendants say that when this refund was made the gross rate from Jellico to Lebanon was $1.65 per ton. This amount was actually collected and retained on domestic coal. The refund left the net rate on steam coal $1.15½ per ton. This refund was discontinued July 20, 1901, and the Louisville & Nashville then established the present rate of $1.20 per ton on all bituminous coal from Jellico to Lebanon. It will be observed that this effected a reduction of 45c. per ton on domestice coal and an advance of 4½c. per ton on steam coal.
>
> The Louisville market appears to be controlled by the movement of coal by river at a low transportation cost, and by the movement of coal from western Kentucky mines at a rate of 60c. per ton by the Illinois Central R.R. These conditions appear to compel the Louisville & Nashville to make a low rate to Louisville on slack coal and on nut and slack mixed, but permit a somewhat higher rate on other grades.
>
> An examination of the tariffs of the Louisville & Nashville R.R. Co. discloses that Lebanon, in this respect, is in no different position from the other local Louisville & Nashville points. Also the present rates to Lebanon appear to be so constructed as to equalize the former refund on steam coal. On this record the Commission cannot say that the present graded rates to Louisville result in unjust discrimination against Lebanon.

HARRISBURG, PENN.

The three-day Industrial, Welfare and Efficiency conference at the State Capitol came to an end on Oct. 29, with an "experience meeting," at which mayors, labor leaders and officials of industrial and labor commissions of this and other states gave the results of their observations and generally agreed that there should be concerted effort by employers and employees to work for abolition of dangerous practices.

The chief address was made by Dr. Lucien W. Chaney, of the United States Department of Labor, who in the course of his remarks, stated that the reputation of American industries for accidents was not good, yet statistics of late years showed that the majority of places were superior to European industries in the matter of casualities.

The conference adopted resolutions recommending that the department of labor and industry which had called the conference in conjunction with the Engineers' Society of Pennsylvania should encourage in every way the organization of safety commissions in works and that its efforts to secure mediation of disputes should be supported.

Naturally the bulk of the discussion and papers went toward the lines where statistics and experience show the casualties are greatest, the industries and the facts and figures presented during the three days of the convention should prove immensely valuable to students of welfare, etc., because they came from every angle of the problem. One of the most significant facts about the addresses was that while the speakers were regarded in most cases as advanced in the benevolent projects of the day, every one counselled study of the proposition and earnestly represented the danger of laws that are not workable or which in the language of the legislative body are "half baked." The only regret about the convention is that it could not have been held before the last legislature convened and the men elected there to have been required to attend its sessions and gain a little knowledge on what they were going to legislate on.

Individuals File Their Answers

George F. Baer, Edward T. Stotesbury, Henry C. Frick, Peter A. B. Widener, George F. Baker, Henry A. du Pont, Daniel Willard, Henry P. McKean and Samuel Dickson, individual defendants in the government's suit to dissolve the so called hard-coal trust, on Oct. 29, filed an answer in the United States District Court, denying the charges of conspiracy to monopolize the sale and production of anthracite in Pennsylvania.

Aside from the general denial of having formed a monopoly in violation of the Sherman anti-trust act and the commodities clause of the Hepburn act, the defendants refer to the answers of the defendant coal companies as filed last week through Charles Heebner. The answer, in effect, merely conforms with the rules of the court, the defense being outlined in the answers of the Reading Co. and the railroads.

Mine Cave Investigation

Charles Enzian, Mining Engineer of the U. S. Bureau of Mines, has been instructed by the Bureau to coöperate with D. T. Williams, former mine inspector, and H. D. Johnson, the two men selected by the city council of Scranton to check up the work of the city mine cave commission, with reference to the cave situation in West Scranton. The attorneys for the city have started two suits in regard to this matter, one of which will probably be settled in February, this being the suit of the Graff Furnace Co. vs. the Scranton Coal Co. The proposition involves three factors—surface, minerals, and surface support. The Supreme Court has held that surface support is the inherent right of the surface, as broad as the grant, and the grantor, who owns in fee both coal and surface, cannot reserve the right of surface support. It is this decision upon which the citizens of West Scranton are relying. One feature which causes considerable trouble is the fact that decisions have been handed down in the lower courts whereby it was held that operators are entitled to all pillars where the lease or deed calls for all the coal. In the cases where royalty is being paid, the lessors insist on their royalties under the ruling of the court entitling the operator to all the coal, and this is in the main responsible for the complete removal of pillars, and makes the situation difficult for the operators who would consider leaving sufficient pillars for surface support.

PENNSYLVANIA

Anthracite

Pottsville—The Philadelphia & Reading Coal & Iron Co. is preparing to tap the rich deposits of coal in the lower levels of the old Anchor Colliery, Heckscherville Valley, near Pottsville. Forty years ago the workings caught fire and the only way to prevent the complete destruction of the operation was to flood it. The water has just been pumped out. These are practically all virgin coal measures and it is thought that millions of tons can be mined. The coal will be prepared at the Pine Knot breaker, at Coal Castle.

Lykens—The Miners' Institute recently formed held its first banquet on Saturday evening. A wagon load of turkeys, forty in number, was prepared for the miners, and the Reading Railroad Co. ran a special train carrying 360 men. The Miners' Institute at this place was organized for the purpose of education as well as developing the town in any way necessary. One of the first questions to be considered is the New School Code passed by the recent legislature.

Wilkes-Barre—The first case wherein parents living in a foreign country, have sued a coal company in this country for the death of their son, was started on Oct. 29, when a suit in trespass was brought against the Delaware & Hudson Co., in behalf of Fredio Hudak and Pajza, his wife, who are residents of Austria. They ask $10,000 for the death of their son, who was killed in one of the company's mines.

The suit is being brought through the Austrian Consular agency and is the first of its kind to be filed in this section of the state. By an act of the legislature of 1911, parents and others living in foreign countries can institute suit for damages for injuries sustained by relatives whose heirs they would be in case of death. Previous to this relatives had to be residents of the state to enter such a suit. The victim was employed by the D. & H. Co., for about four months and was caught by a runaway trip on a slope.

Scranton—Five miners while employed at timbering in the Taylor mine of the D. L. & W. R.R. Co., were seriously burned by an explosion of gas recently. The men were carrying naked lamps and in going from one part of the mine to another they suddenly walked into a body of gas in the Big vein and the explosion followed. They were knocked down by the concussion and were burned about the face, hands and upper part of the body.

On Oct. 29 several miners employed in the Diamond mine of the Lackawanna Coal Co. had a narrow escape when men, blasting for a sewer, fired a heavy charge, knocking a hole 5 ft. long and almost as wide into the mine workings. The men were mining coal only a few feet away, but none were injured.

Shamokin—On account of a holy day on Nov. 1, many of the collieries were closed. Ministers interested in an evangelistic campaign to be waged next winter appealed to the miners to help them clear a plot of ground on which to erect a tabernacle. A large number responded to the call and by night had things in shape for carpenters to begin work. The building will seat 3000 persons. Even most of the carpenter work will be done by the miners free of charge.

Glen Lyon—A committee representing 4000 men and boys employed at the Susquehanna Coal Co.'s collieries have waited on Supt. Kohlbreaker to ask assistance in having non-union men employed at the collieries join the miner's union. The committee had to be referred to the general manager's office at Wilkes-Barre and will probably receive a hearing in a few days before another "button strike" is called in the lower valley workings.

Bituminous

Beaverdale—The Logan Coal Co. is installing extensive improvements at the workings, including a slope and motor system of haulage, in place of the present rope and shaft haulage. The improvements will greatly increase the daily output. The Pennsylvania Coal and Coke Corporation mine at this place is also to be converted into a drift mine.

Johnstown—It is likely that an appeal will be taken by counsel for E. H. Werner et al, in the case against the Western Maryland R.R. Co. in which damages to the sum of $110,000 were asked because of the building of a new spur of the railroad through properties of the defendants. Judge Reed of Jefferson County heard the award. There were four sets of plaintiffs, the Central Savage Firebrick Co., lessees of the coal and clay mining rights, Emanuel Statler who owned one-third interest in the coal, E. H. Werner, who owned one-third of the coal and Samuel U. Shober and George F. Kimmell, who owned the remaining interest in the coal.

Blossburg—The Carnegie Hero Fund Commission at its fall meeting in Pittsburgh on Oct. 31, awarded the widow of James Jack, Jr., who died saving Michael Gallant and Martin Gula, miners, from a runaway train in a coal mine at St. Benedict, Penn., a silver medal and a pension of $50 per month, with $5 a month additional for her daughter until the child reaches the age of 16.

Washington—Norvella V. Sower has filed his statement of claim against the Monongahela River Consolidated Coal & Coke Co., in which he asks $5000 damages for personal injuries received while employed on a motor in the mines of the company in July. The company is charged with negligence in not providing a safe place to work and in permitting a motor to remain out of repair. It is averred that the plates on a certain motor, which protect the gear wheels, became worn out and dropped off, leaving the teeth exposed, into these the plaintiff got his hands, receiving painful injuries.

Cairnbrook—The Berwind-White Coal Mining Co., which has a large tract of valuable coal land, is not ready to begin operation of the new field at this time. Preparations will be made this winter, however, to open the tract as soon as spring weather arrives. The Lochrie and Loyalhanna mines are ready to ship coal as soon as the branch line from Windber is completed by the Pennsylvania Railroad.

WEST VIRGINIA

Eskdale—Three hundred miners employed by the National Bituminous Coal & Coke Co., in Eskdale on Cabin Creek, recently struck because of a dispute over the price of pick mining.

Charleston—The coal-property assessment appeals heard recently by Circuit Judge Samuel D. Littlepage have been decided by him in favor of the coal company. State Tax Commissioner Fred O. Blue may appeal to the Supreme Court.

Gary—The Government Bureau of Mines' rescue car No. 7, in charge of Jesse Henson, after spending two weeks on Pond Creek, is now at Gary. This car is on the road for the purpose of giving men instructions and training in the use of oxygen breathing apparatus and first-aid work. It will remain at the operations of the United States Coal & Coke Co. until Nov. 8, after which time it will go to Jenkinjones, Switchback and Pocahontas.

ALABAMA

Tuscaloosa—The barge line connecting the coal fields of the Birmingham district with the Gulf, through the Warrior River, was opened last week. This barge line will give the coal fields of Alabama direct water connection with the Gulf, and opens up a rich field of coal deposits, Tuscaloosa, Ala., being the chief city from which shipments will be made.

Birmingham—Alabama had a decrease of nine mine fatalities for the first seven months of 1913, against the corresponding period of last year. The record of the United States as a whole is not so encouraging, as the 1913 list shows an increase of 18 over the same period of last year. In the Alabama mines during the first seven months of 1912, 64 men met death by fatal accidents. During the first seven months of 1913, 55 miners have been killed. For the entire country, there have been 1437 miners killed during this period, while in the same length of time last year 1419 miners were fatally injured in the mines.

KENTUCKY

Earlington—The Illinois Central R.R. has renewed its contracts for coal with the operators along its lines in western Kentucky. The contract runs for one year, the old contract expiring this month. The agreement was changed slightly, and there was a discussion of the amendment, the document finally being made on a mutually satisfactory basis.

Pineville—The Wallins' Creek Coal Co. has completed a new tipple, replacing that which was destroyed by fire several months ago, and is again delivering graded coal. It was compelled to market only run of mine during the time it was without screening facilities. The company has recently acquired additional property, and will enlarge its capacity.

Rockport—A few of the small coal mines, are having trouble with their miners, and at one mine the men have walked out. The walk-out resulted from the discharge of several men who quit work on the day of a rally at Madisonville intended for the purpose of organizing the miners of western Kentucky.

Morganfield—E. K. Ashby, who operated what is known as the Thomas coal mine, has disposed of the property to the Jackson Coal Co., Ft. Branch, Ind. The new owner will operate the mine, which has been idle for some time.

OHIO

Columbus—The Lorain Coal & Dock Co. has appealed to Judge Vickery to set aside a $111,000 verdict awarded by a jury in Judge Lawrences court against them and in favor of Anton Pietrowski, of Lorain. The corporation declares that it is not responsible because Pietrowski was injured when the corporation was a West Virginia company. It is now an Ohio corporation.

The Ohio Mining Commission, which has finished visiting mines in Ohio and adjoining states, had only a few sessions during the past week when Professor Ray of the department of Mines of the Ohio State University and Professor Bownocker, of the department of geology of the state institution, appeared before it. Arguments from the miners and operators will be heard beginning Nov. 5, according to the present arrangements.

As the aftermath of a fire which is said to have done thousands of dollars damage, caused it is alleged, by oil being allowed to escape in coal, the Rock Run Coal Co. has filed suit for $50,000 damages against the Chartiers Oil Co. The coal company is the owner of what is termed the No. 6 vein in Coal Township, Perry County, Ohio, and declares that although the oil company knew it was the owner of the 20-acre tract and was mining therein, it drilled a well for some distance below the coal.

Dayton—The announcement is made that the W. P. Rice Coal Mining Co. recently incorporated with an authorized capital of $75,000 will develop coal lands in Athens county, Ohio. The conpany's headquarters will be located at Dayton.

INDIANA

Indianapolis, Ind.—The Monon Coal Co. and the Consolidated Coal Co., operating mines in the Sullivan-Linton group, embracing the counties of Sullivan, Green, Owen and a part of Clay, have petitioned the Interstate Commerce Commission for a regrouping of the mines in Indiana with reference to rating to the Chicago district. Mines in the Brazil-Clinton group, comprising the counties of Vermilion, Vigo, Park, and a part of Clay have a rate of 77c. to Chicago, and the mines in the other group 87c. Being competitive, it is claimed the mines in the two districts should have the same rating.

Petersburg—The Knox Mining Co., of Bicknell, and Martin & Miley, of Montgomery, have leased more than 2000 acres of coal land near here.

Princeton—The fire in the Ft. Branch mine of the Ft. Branch Mining Co., which it was thought had been extinguished last week after three days' burning, has broken out again and is more threatening than at first. The mine-rescue car was summoned from Evansville.

ILLINOIS

Benton—The cages at the shaft of the Benton Coal Co. dropped to the bottom of the shaft a few days ago, putting the mine out of commission for several days. No one was seriously injured.

East St. Louis—At several points in Southern Illinois there are many petty strikes on account of local grievances. This is a forerunner of what is to be expected Apr. 1, next, when the present agreement expires.

Decatur—A miner, John Magill, in the Lovington Mines, dug out a few days ago a petrified human foot. It was imbedded in rock almost a thousand feet below the surface. It has been sent to experts for examination.

Zeigler—Some little time ago a slight explosion took place in the mine at this place; there were about 450 men in the mine when the explosion occurred, but only one was burned by the explosion and no one was fatally injured.

Livingston—The No. 1 mine of the New Staunton Coal Co., located at this place, made the following averages for the first half of the month of September: The average output per day of eight hours was 4277 tons and for the last half of the same month the average daily hoist was 4318 tons, the later figure means about 539 tons per hour, or nearly 9 tons per minute. This is a machine mine, operating in the No. 6 seam and is 286 ft. deep.

Springfield—The State Mining Board will hold an examination for state mining inspectors, beginning Monday, Nov. 17, in the office of the Board, Springfield, Ill. This Board has been reorganized recently, the following members having been appointed: John Bohlander, president, Pekin, operator; James Forester, Hallidayboro, operator; James Shaw, secretary, Virden, miner Thomas L. Jones, Ladd, miner; J. B. McKiernan, Peoria, hoisting engineer.

The mines of the O'Gara Coal Co., located in the counties of Sangamon, Macoupin and Saline, have resumed operation after an idleness of several weeks owing to financial troubles.

ARKANSAS

Fort Smith—The recent coal-mine strikes, affecting nearly 700 miners in Oklahoma and Arkansas, were amicably settled Oct. 29. Five hundred men returned to the Oklahoma Co.'s mines, at Dewar, Okla., and 175 men to the Eureka Coal Co.'s mine at Montana, Ark.

NEW MEXICO

Dawson—Work was resumed Oct. 30 in Mines Nos. 1, 4 and 5 of the Stag Cañon Fuel Co., with about one-third of the normal force. Forty-two bodies still remained in mine No. 2. The wrecked workings have been explored and the remaining bodies will be brought out as soon as possible. Upon this date 219 dead had, in all, been taken from this mine.

OREGON

Portland—Anthony Mohr who is interested in the development of a coal proposition south of Fossil, Ore., has extensive reports to present to the officials of the Oregon-Washington R.R. & Navigation Co., with a view of having the road extend its line to the fields. Mr. Mohr reports having put in the months of June and July in the coal district, where his syndicate holds leases on 2000 acres of land. He says an 8-ft. seam of semi-bituminous coal equal to the Rock Springs variety has been located. He also says further work will be prosecuted in February.

FOREIGN NEWS

Juneau, Alaska—A despatch from Juneau states that the registrar and receiver of the Juneau land office have recommended to the commissioner of the general land office that the Hartline group of coal claims in the Bering River district, Alaska, located by various members of the Hartline family of Anna, Illinois, be canceled for failure to open and develop the claims. The local land office found that the charges of fraud alleged to have been committed by John W. Hartline and others in locating the claims were not proved.

Lingan, Nova Scotia—Owing to the increasing demand for Cape Breton coal, which cannot be supplied by the companies now operating, it is proposed to develop on a large scale the coal areas owned by the Lingan Coal Co., Ltd., in the vicinity of the old Gardiner mine at Lingan. This property is stated to contain 40,000,000 tons of good workable coal. The movement is being promoted by A. C. Ross, who has been for many years prominent in connection with the mining and industrial development of Cape Breton. Mr. Ross will make Montreal his headquarters and will endeavor to interest Canadian and American capitalists in the enterprise

Udi, Nigeria—It has been announced that extensive coal deposits have been discovered at Udi, Southern Nigeria, West Africa. Tests carried out by the Government and analyses at the Imperial Institute in London are said to have given results, at least two-thirds as good as those of the best Welsh coal. It is also stated that a survey for a railway to connect this coalfield with the river port of Onitsha is being carried out. The importance of this line as affording cheap fuel to the two Nigerias would be great, while it would make for the development of the trade of this rich district and the settlement of internal disputes among the natives of the hinterland.

Vancouver Island, British Columbia—Progress toward resumption of production of coal at normal rate is slow, except in the case of the mines of Comox colliery (Cumberland) of the Canadian Collieries (Dunsmuir) Ltd. For the month of September the output of the Cumberland mines was 52,187 tons, nearly one-third of which was from No. 5 mine.

The riots of the strikers that took place in August did not cause a stoppage of work at Cumberland. At the same company's Extension mines, though, operations had to be suspended, following destruction of three electric locomotives, a number of mine cars, and part of the surface buildings, to which the strikers set fire.

The Vancouver-Nanaimo Coal Mining Co.'s Jingle Pot mine is the only one on Vancouver Island being worked with U. M. W. of A. men; its production is probably about 200 tons a day, but definite information has not been obtained. The Pacific Coast Coal Mines, Ltd., is working its South Wellington mine, but as miners are not yet obtainable in sufficient numbers to admit of a larger production, output is only about 200 tons a day. This company is proceeding with the equipment of two new mines in the northern part of Vancouver Island. The Western Fuel Co., which has large mines near Nanaimo, is not yet making any regular production worth noting, though it is stated it is getting out a little coal.

PERSONALS

J. Warber Shook, vice-president and general manager of the Central Iron & Steel Co., at Holt, Ala., has tendered his resignation, and will enter other business. Mr. Shook is one of the best known coal and iron men in the South.

Erskine Ramsey has been appointed as the Birmingham member of the American Executive Committee of the Anglo-American Exposition to be held in London next year.

W. L. Klutz, formerly superintendent of the Thomas furnace of the Republic Iron & Steel Co., at Thomas, Ala., has been appointed general manager of the Central Iron & Coal Co., at Holt, Ala.

W. A. McDonald has been appointed manager by the Vancouver, B. C., men who recently acquired the coal property of the Columbia Coal and Coke Co. formerly controlled in Winnipeg, Manitoba.

John Mitchell, former president of the United Mine Workers of America, was honored by thousands of miners throughout the various coal fields of Pennsylvania, on Oct. 29. Little or nothing was done at the collieries. Parades, mass meetings and many large demonstrative celebrations were held at Wilkes-Barre, Pottsville, Scranton, Shamokin and Hazelton.

E. N. Saunders recently elected president of the Northwestern Fuel Co., is one of the youngest men in St. Paul at the head of a large corporation. The Northwestern Fuel Co., with a capital of $4,500,000, has extensive interests in this section, while the docks at Duluth are among the most modern in the country. Mr. Saunders is 36 years of age and a graduate of Yale.

Jas. McEvoy, of Toronto, Ontario, who was associate leader of one of the International Geological Congress excursion parties that went west after the close of the congress, has recovered from the attack of pneumonia that necessitated his going into hospital in Vancouver, B. C. Before returning to Toronto, he examined the property of the Columbia Coal and Coke Co., situated in Similkameen district, B. C.

CONSTRUCTION NEWS

Pomeroy, Ohio—The K. & M. Railway Co. has started to build a two-mile branch up Thomas Fork to tap a new coal territory which is being opened by the Stalter-Essex Coal Co. It is expected to have the mines opened by the first of the year.

Butler, Penn.—Work has been commenced on the plant of the Lake Trade Coal Co., located a short distance from Argentine. This company has more than a thousand acres of coal land under contract in this district, and the intention is to mine 1000 tons of coal per day when in full operation.

Venice, Penn.—Work on the new Montour branch of the P. & L. E. railroad is progressing rapidly, and should be ready for the ties and track in a few weeks. Work on the new mines No. 1 and 2, is being pushed and it is expected that the mines will be producing by the time the railroad is completed.

Crow's Nest Pass, B. C.—The building of a new locker house has been undertaken at the Crow's Nest Pass Coal Co.'s Coal Creek mines, present locker accommodation being inadequate. Production of coal from the B North mine, Coal Creek, has been considerable lately; the new jig is now in operation there.

NEW INCORPORATIONS

Columbus, Ohio—The Kingwood Collieries Co., of Columbus, Ohio, has been incorporated with a capital stock of $100,000 to mine and deal in coal. The incorporators are J. W. Miller, J. S. McVey, D. N. Postlewaite, L. M. McGrath and M. A. Fanning.

Glen Campbell, Penn.—A charter was granted the Superior Coal Co. to mine coal; capital $5000. The incorporators are George S. Hampton, Harry T. Rotenbury, and H. J. Ehrlech all of Philadelphia.

Harrisburg, Penn.—The following companies have filed notice of an increase of debt with the Secretary of State. The Susquehanna Coal Co. from nothing to $10,000.000 for the ultimate purpose of absorbing the coal properties of the Pennsylvania R.R. Co.; the Wilkes-Barre Colliery Co., of Wilkes-Barre from $310,000 to $500,000; Dexar Coal Co., of Philadelphia from $5000 to $50,000; and the Hawthorne Coal Co., of Williamsport from nothing to $67,000.

Philadelphia, Penn.—The Eastern Ore Co., of Philadelphia, has been incorporated under the laws of Delaware, with a capital stock of $1,000,000. Object to acquire coal, iron and other minerals and ores.

INDUSTRIAL NEWS

Glasgow, Scotland—One hundred thousand miners in Scotland have received an increase of wages amounting to 6c. per day.

Lansford, Penn.—The boiler makers and apprentices of the Lehigh Coal & Navigation Co. have received an increase of wages, ranging from 2c. to 5c. per hour. This increase is to last for one year.

Birmingham, Ala.—The Philadelphia furnace of the Sloss Sheffield Steel & Iron Co., at Florence, Alabama, which has been out of blast since last May, has been relined, and was blown in in October.

Steubenville, Ohio—The tow-boat "Robert Jenkins" on its way south with a coal float, lost five barges here. The barges crashed into a pier of the Panhandle railroad bridge and sank. The tow boat was not damaged.

Columbus, Ohio—The Ohio State Utilities Commission has granted permission to the officials of the Hocking Valley Railway Co. to issue $4,000,000 one-year notes for the purchase of equipment providing they are not sold under 98 per cent.

Carrollton, Penn.—T. S. Davis recently purchased a tract of about 1100 acres of coal in the vicinity of Bradley Junction, representing an expenditure of close to $50,000. The coal brought an average of $40 per acre, and was purchased from Peter Bertram, John Hershell, and others.

Sydney, N. S.—Nearly 7,000,000 tons of coal were mined in 1912 from the four Nova Scotia coalfields; Sydney, Inverness, Pictou and Cumberland. Approximately half of this amount was sold in the Maritime Provinces, the rest going to Quebec and the United States.

Washington, Penn.—In connection with the trouble at the Reliance Coke Works, near Centerville, attorneys, on Oct. 30, filed 11 more ejectment suits against miners living in company houses who refused to work in the mine. The court honored the request of the company and directed the sheriff to eject these 11 men and their families.

Duluth, Minn.—The barge "Santigo," of the J. J. Boland line, Buffalo, with 2500 tons of anthracite, cleared for the Soo recently with the first load of coal ever shipped east from Duluth by way of the Great Lakes. The cargo consisted of screenings from anthracite shipped uplake in the summer and has been sold to a company at Sault Ste. Marie.

Philadelphia, Penn.—Hearings of the Interstate Commerce Commission on the anthracite coal rates will begin at the Bellevue-Stratford Hotel, Philadelphia, on Nov. 17, with Commissioner J. H. Marble in charge. It is reported that the anthracite carrying roads will be called upon to submit evidence. The hearings will be the first held since the recent investigation was started.

Hickory, Penn.—Charles Marquis, of Woodrow, has sold his farm containing 260 acres to Virgil McDowell of Midway. The consideration was about $33,000. Mr. McDowell is the agent for the Carnegie Coal Co. The farm is known as the Thomas McCorkle farm. It came to Mr, Marquis through the will of Mrs. McCorkle. This farm is one of the last to be sold in this section for its coal.

Crow's Nest Pass, B. C.—The Crow's Nest Pass Coal Co. has contracted to supply coal to the City of Spokane, Washington, at the following rates: For slack, $4.80 a ton; mine run, $5.55; No. 1 lump, $5.75; No. 2 lump, $6.15. These prices include delivery at the city buildings, which means about 50 cents a ton in favor of the city. Tenders had been invited, but the Crow's Nest Co. declined to put in a bid; the bids received showed an increase on last year's prices for mine run and lump coal, notwithstanding the recent tariff reduction of 45 cents a ton.

Vancouver Island, B. C.—The Canadian Collieries (Dunsmuir) Limited has ordered electrically driven pumping plants for three of its mines—one unit each for its No. 5 mine, Comox colliery, Cumberland, and Extension colliery near Ladysmith, and two units for its newly opened No. 8 mine, situated about four and one-half miles from the town of Cumberland, Comox district. One of the last-mentioned will consist of two pumps working in series, to deliver 350 gal. per min. against a head of 740 ft. Of the others, two will be driven by 75-hp. alternating-current motors, and the third by a 75-hp. direct-current motor; each of these will be capable of delivering 350 gal. per min. against a head of 370 ft. The pumps will be manufactured by Canadian Allis-Chalmers, Ltd. and the motors by Canadian General Electric.

COAL TRADE REVIEWS

GENERAL REVIEW

Anthracite trade assuming the usual winter activity but lacking snap except in certain grades. Soft coal showing wavering tendency in spots. Lower temperatures and a tightening in car supply having a steadying influence. Most grades now in good supply.

Hard coal operations are more or less closely confined to certain sizes, and the trade lacks the characteristic snap usual at this time of the year. However, the slow movement is causing a certain uneasiness, and the companies are not inclined, as a rule, to take on any new business. Indications are that there is not a great deal of coal in dealers' hands. Stove and broken are short, particularly the former, and dealers are finding it necessary to do considerable jockeying to keep supplied in all grades.

Bituminous operators have so far held the market firmly but there is an undeniable wavering tendency, due to the unusually heavy business through the summer, and the absence of any new demand. This is particularly the case in the Eastern Coastwise trade where large corporations are asking that shipments on contracts be delayed, and producers are inclined to modify prices although no shading of consequence has yet developed. Wholesalers are finding themselves unable to place the unexpectedly heavy tonnages from West Virginia, particularly as a great deal of this trade was covered by Pennsylvania coals in anticipation of a shortage in the former grades. Plentiful supply, even of the better qualities, is the feature of the situation at the moment.

A complete absorbtion of the abnormally heavy production of slack, incident to the large movement to the lakes is the feature of the situation in the Pittsburgh district. The car supply has been better than was anticipated, while the increased retail demand has about equalized the decreased industrial consumption. The situation in Ohio is more encouraging. Production is being steadily restricted, due to the short car supply, and demand is on the increase. The recent cold snaps resulted in a heavy rush for coal, and prices are ruling firm with a tendency toward higher levels.

Trade at Hampton Road is brisk, with a good supply of both coal and vessels; the demand is heavy, extending even into the high volatiles. The car situation has been somewhat easier, and producers are optimistic in spite of unfavorable reports in other parts of the country. In the Southern market, both coal and coke are quiet, particularly the steam grades, and there is little indication of any immediate improvement.

Low temperatures and a further restriction in the car supply has had a tightening effect upon the Middlewestern situation. The trade is on a comparatively strong basis, with prices on certain grades exceptionally high. There is a heavy movement in anticipation of a severe winter; the country districts are also coming into the markets stronger, and the outlook is good at the present.

BOSTON, MASS.

Pennsylvanias seem to find a ready sale. Uneasiness over anbordering on a weak market. Market cargoes at distributing points. Georges Creek in plentiful supply. Higher grade Pennsylvanias seem to find a ready sale. Uneasiness over anthracite supplies, particularly on stove.

Bituminous—Pocahontas and New River are apparently entering on a dull season. No intimations of any shading of the $2.85 f.o.b. price have been heard but the market cannot be said to be very strong. The export business has slumped for the present. Coastwise there is almost no inquiry and conditions are as easy as though it were midsummer. Even the corporations are asking that shipments on contract be postponed and there is a general anxiety on the part of the agencies to make sales.

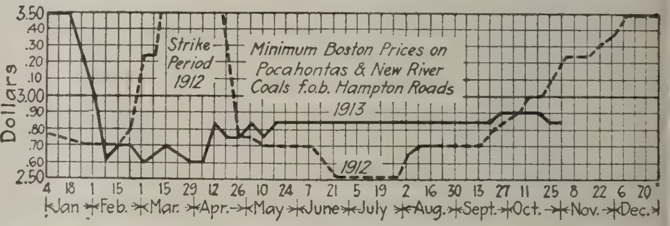
Market cargoes, a sure index of a weak market, have appeared this week and on car prices have dropped a notch or two lower; $3.70 has been reliably reported for Hampton Roads coal for inland delivery, a price that would net $2.70@2.75 f.o.b. loading port.

The outlook is not particularly encouraging, although much may happen at this season either to cut down output or stimulate demand. The West Virginia production has been rather heavier since July than was anticipated and contractors at this end have not absorbed fuel to quite the extent that was looked for. During the suspension, too, when there was uncertainty over necessary supplies, considerable tonnages of the Pennsylvania grades were picked up by the large consumers. Everything considered it is not surprising the market is druggy now.

Georges Creek is also in strong supply and with not the spot business in sight that is necesary to keep car equipment working. It looks now as if this popular grade were over the hump and that for the balance of the season there would be supply enough to meet contract demands.

More is being heard of car shortage in different districts in Pennsylvania. The market on the better grades continues fairly firm with moderate inquiry. Some of the operators have modified prices 5@10c. in order to take business for which cars are likely to be in better supply and also to tide them over what they consider only a temporary dullness.

There has been a slight stiffening in water freights since the bad weather in October, particularly on the smaller craft out of New York; 75c. is about the rate from Hampton Roads to Boston for sail and barge tonnage. There is a call now for outside transportation to bring anthracite that is furnished by individual operators and rates are understood to be around 65c. to Boston.



Anthracite—All the companies are slow on deliveries and have instructions out to be wary of new business. Dealers are doing everything possible to get stove coal in something like the proportion demanded by their trade but that size as well as broken is coming forward extremely slow. Premiums f.o.b. New York for stove are reported to be 25@35c. and straight cargoes are out of the question. The continued slow movement of tows and the colder weather are making some of the Eastern dealers uneasy on account of the short time left for receiving cargoes up the rivers.

Quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.05@1.60	$1.30@1.70	$1.67@1.77	
Philadelphia*	2.30@2.85	2.55@2.95	2.92@3.02	
New York*	2.60@3.15	2.85@3.25	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@2.90
Providence†				3.70@3.80
Boston†				3.70@3.88

*F.o.b. †On cars.

NEW YORK

Recent holidays have restricted both anthracite and bituminous production and steadied up local markets. Production up to full limit but demand not so urgent. Colder weather having a stimulating effect.

Bituminous—There is no material change in the soft-coal market, although the tendency, if anything, is easier. The holidays last week, together with Election Day this week, have resulted in a short output which has had a steadying effect upon the situation. Mines as a rule continue working up to full capacity.

On the other hand, the car supply seems to be holding better than was anticipated, and there has been a heavy movement of soft coal; cars on the Pennsylvania and B. & O. railroads are reported at 60@75% of requirements. Supplies at tidewater have increased some during the week. The market is now waiting the advent of the consuming interests into the trade. So far as the prompt demand goes, it has been principally confined to the jobbing interests, and a further expansion does not seem probable until the real consumers appear.

The market in the wholesale trade is not quotably changed from last week, which prices we continue as follows: West Virginia steam, $2.65@2.75; fair grades of Pennsylvania, $2.75@2.85; good grades of Pennsylvania, $2.85@2.95; best Miller Pennsylvania, $3.15@3.25; George's Creek, $3.20@3.30.

Anthracite—The hard-coal situation has failed to show any material change as yet, due to the colder weather; apparently this has been of a too intermittent character to have any effect. However, this has started coal moving out of the dealers' hands, and it will not be long before the effects are felt in wholesale circles. Stove coal continues to be the leader among the short sizes, although it is a trifle easier this week. Egg is rather heavy and difficult to move. The steam sizes continue about the same, the low grades being in long supply.

Production in the mining regions was badily restricted by two holidays last week and by Election Day this week, although a number of the mines attempted to work on this latter holiday. Aside from these interruptions, the companies are working full time. The car supply is still inadequate; this has not as yet seriously affected the production, but, in view of the early development of this trouble, operators are apprehensive over what conditions will be when the general car situation reaches serious proportions.

We continue New York hard-coal prices unchanged, with the exception of stove, which is now quotable at the regular circular as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	....	$4.95	
Egg	5.25	$5.15@5.25	5.20	$5.00@5.20
Stove	5.25	5.25	5.20	5.20
Chestnut	5.50	5.40@5.50	5.45	5.35@5.45
Pea	3.50	3.40@3.50	3.45	3.35@3.45
Buckwheat	2.75	2.60@2.75	2.45@2.70	2.00@2.70
Rice	2.25	2.25	1.95@2.20	1.75@2.20
Barley	1.75	1.75	1.70	1.50@1.70

PRILADELPHIA, PENN.

Market lacks the general urgency, customary at this period of the year. Active business restricted to certain grades. The new Pennsylvania state tax again becoming a feature in the situation.

The anthracite trade in this vicinity, still seems to lack the snap that should chacterize it at this season of the year. Outside of broken and stove coal, there does not seem to be a particularly urgent market. Of course, dealers that place orders expect them filled promptly, an indication that points to the fact that there is not a great deal of coal on hand in the dealers' yards, but the operations of the retailers, as well as the wholesale market, seems to be concentrated on certain sizes. The movement of egg and chestnut is enhanced by the decree of the operators that orders for the scarce sizes shall be accompanied with a certain proportion of the other sizes, but this argument cannot be passed along to the consumer; it requires considerable jockeying on the part of the dealers to so adjust their stocks that they will get a proportion of the sizes they are in urgent need of.

It is understood that, with the beginning of the winter season, the addition of the Pennsylvania State tax is being more generally observed than has been the case heretofore. Those operators or companies who have absorbed this tax during the hot spell, established no precedent, they say, and now that business is moving along with practically no concessions of any kind, the dealers are being saddled with this additional expense. In the city proper, this tax still continues to be absorbed, but in the suburbs, many of the dealers are including it in their price to the consumer.

The market for pea is increasing daily, with the supply only governed by the ability to load. There is as yet no indication of shortage in this size, it being understood that the large companies are fairly well stocked. The other steam sizes are also looking up, and as the winter advances, will show considerable improvement.

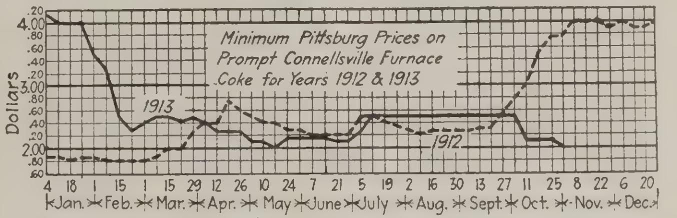
PITTSBURGH, PENN.

Heavy demand for slack the feature of the local market. Increased domestic consumption equalizing the lessened industrial demand. Full competition in Connellsville coke and market demoralized.

Bituminous—Lake shipments continue heavy, and will be kept up, weather permitting, until the last moment, the vessel insurance coming off Dec. 1. Despite the heavy shipments there is practically no accumulation of slack, and it is commanding $1@1.10 right along. A large interest which normally accumulates considerable slack to dispose of in the winter has relatively little so far, while another large interest which intended to begin piling up slack July 1 has piled none as yet, and may be inconvenienced in meeting its contract requirements this winter. There would be a ready sale to operators at the circular price of 90c., to apply on contracts, but none is available at this figure.

Demand for 1¼-in. from retailers is heavy now, apparently equalizing the slight decrease there has been from manufacturers, owing chiefly to the slowing down in iron- and steel-trade activity. While car supply is not good, it is better than was expected for this period, and coal production is nearly at capacity. Some operators would make contracts for a full twelvemonth at the regular circular prices of the season, based on $1.30 for mine-run, but others would not, while earlier deliveries command higher prices, which may be quoted approximately as follows: Slack, $1@1.10; mine-run, $1.40@1.50; ¾-in., $1.50@1.60; 1¼-in., $1.65@1.75 per ton at mine, Pittsburgh district.

Connellsville Coke—The coke market has been in mixed condition since the break reported last week from the $2.50 quotation of a group of operators. For several weeks previous the condition had been as follows: The Producers' Coke Co., the accredited sales representative of operators having about 5000 ovens, was quoting a uniform price of $2.50 on furnace coke, irrespective of delivery, while a second group of operators having about the same number of ovens sold their coke independently but quoted $2.50 as minimum, and a third group of about 5000 ovens were selling at various prices as occasions seemed to suggest. The market was made exclusively by these last, and was $2@2.15 for furnace coke. Some three weeks ago some of the second group of operators quietly quoted cut prices, down to $2.25 or lower; about ten days ago a sale was made, according to authenticated accounts, by the Producers' Coke Co. of 10,000 tons November to an Eastern steel company, at $1.90, as reported a week ago. At the same time it was admitted that the $2.50 price had been abandoned.



The expectation of the $2.50 operators had been that when contracts expired quite generally Dec. 31 there would be such a redistribution of business as would give them a fair operation, their output recently being less than 50% of capacity, but with decreased consumption of coke it appeared probable that the business would do little more than fill up the cut price operators. There is now full competition between all the operators not provided with contracts, and the market is quotable at about $2 for prompt furnace, and possibly $2.25 for contract furnace, though without any serious negotiation. Foundry coke is about $2.75 for prompt or forward. The whole market is in uncertain position, reflecting not only the break among the operators, but also the continually decreasing activity in the iron and steel trade.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Oct. 25 at 385,670 tons, an increase of 6065 tons, and shipments at 389,068 tons, an increase of 5055 tons. Prospects are that the next report will show a great reduction in both production and shipments.

BALTIMORE, MD.

Market remains rather unsteady. Mine interests determinedly holding to old standards. Exports showing improvement. Anthracite much more active with colder weather.

That the coal market here is wavering seems to be undoubted. In view of the abnormally good conditions prevailing through the fall and summer the best posted coal men have been predicting for some time that a drop would occur. The previous week's break, in both demand and prices has continued and it is generally reported that there was practically little or no new demand. Prices have held about the same, although an exception was slack, which sold down to $1 and $1.05 in some cases, a drop of about 15c. from the figures of a couple of weeks ago.

Operators are working desperately to hold the market. With plenty of coal on hand and a liberal supply of cars at most of the operations, there was a general refusal to sell at less than prices that were obtained recently. Although many coal men are predicting that a flat period is yet to be passed through, the operators for the most part appear sanguine and expect an early strengthening all along the line. There seems to be a determination on their part not to sell coal at low prices.

The situation locally is rather slow, as there is not much spot demand. Considerable coal is reaching tide for shipment over the piers, but this is mostly for domestic coastwise delivery or on export, and under contract. The export trade shows distinct signs of improvement.

Along anthracite lines there is some real activity. The past week brought the snappy sort of weather that meant business. Domestic sizes were all in excellent call and jobbers have orders for quick delivery that will mean a busy November.

BUFFALO, N. Y.

Weather and transportation conditions against bituminous trade. Much activity in anthracite in the West. Car shortage as great as ever. Coke continues weak.

Bituminous—The market for sizes in bituminous is not so strong and various members of the trade differ as to prices. The producer is certain that with winter coming on and cars scarcer that it is not going to be difficult to maintain a price which was strong last July. There is not much more talk about a special weakness setting in when the lakes close, as slack is much firmer than sizes and besides the demand for lake tonnage is heavy; coal is now being shipped out from upper-lake docks to country points beyond Lake Michigan faster than it can be obtained for shipment at lower-lake ports. It will be another month before the heavy demand for coal in the lake trade is over, and in the meanwhile the misunderstanding about the rail-freight rate will be settled. Some shippers still believe that the 5% advance is to go in, but it is supposed at the same time that the consumer has no such idea now and has stopped buying on the strength of it.

There will also be a strong effort to put in at least two months' supplies ahead of a possible strike next April.

Actual consumption of bituminous does not seem to have fallen off. Shippers as a rule say that they can hold the price till the stocking up against the spring suspension begins. Cars are so short that it will not be possible to flood the market when the lakes close and the uncertainty as to the turn of business generally may give way to firm confidence any day. Prices hold, but not with anything like the firmness of the earlier part of the season.

Quotations continue as before, $2.90 for Pittsburgh lump, $2.80 for three-quarters, $2.65 for mine-run and $2.25 for slack, which is much stronger than sizes. High-grade Allegheny Valley coal is steady at about 25c. less than Pittsburgh.

Coke—Reports are still against any stability in coke. All prices are weak and though the trade continues to maintain a basis of $4.85 for 72-hr. Connellsville foundry the conditions are not favorable to holding it long.

Anthracite—The difficulty with anthracite in this market and Westward is the impossiblity of getting a satisfactory supply. Some shippers express a readiness to go into the open market and buy in large quantities. The local demand is moderate, on account of warm weather. There is no surplus of independent anthracite, though no premium is yet reported. Lake shipments for the week were 106,000 tons and for October. 564,160 tons. For the season to the end of October the shipment is 4,404,696 tons, as against 3,241,653 tons to the same time last season.

COLUMBUS, OHIO

Decrease in the car supply on most roads has still farther curtailed production. Prices continue at the Nov. 1 circular and are well maintained; higher quotations freely predicted. Domestic demand particularly strong.

Operators in all of the mining districts are complaining of the short car supply which has decreased operations to a greater extent. As a result the tonnage is falling off in the face of increased demand. Prices are ruling firm and all changes are toward higher levels.

The first cold snap of the season produced such a rush of domestic orders that operators and jobbers were unable to take care of the business. One of the big drawbacks is the car shortage which is gradually increasing and from which there is little hope of remedy. Most of the retailers have asked for immediate shipment as they are desirous of accumulating stocks to guard against a famine. In the Hocking Valley the output is estimated at 50% and the same is reported from the strictly domestic fields. In the Pomeroy Bend the production is about 40 per cent. while Eastern Ohio reports about the same.

There is still a good demand from the Northwest and boats are still being chartered but some delay is occasioned in loading. Up to Nov. 1 the total tonnage handled by the Hocking Valley docks at Toledo was 2,500,000 which is about the average in previous years. Lake prices are still strong in every way. Steam demand is good with signs of improvement. Railroads and many factories are using quite a tonnage. Manufacturing generally is holding up and the fuel requisitions are as large as usual for this time of the year.

Quotations in the Ohio field are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump.....	$2.00 @ 1.90	....	$2.25 @ 2.15	$2.00 @ 1.90
3-4 inch...........	1.85 @ 1.75	$1.50 @ 1.40	2.00 @ 1.90	1.85 @ 1.75
Nut...............	1.30 @ 1.20	....	1.75 @ 1.65	1.40 @ 1.35
Mine-run..........	1.50 @ 1.40	1.35 @ 1.30	1.50 @ 1.40	1.50 @ 1.45
Nut, pea and slack..	0.90 @ 0.85	....	1.00 @ 0.90	0.85 @ 0.80
Coarse slack........	0.80 @ 0.75	1.00 @ 0.95	0.90 @ 0.80	0.75 @ 0.70

DETROIT, MICH.

Price advance due to heavy demand and car shortage. Domestic grades quiet, except Hocking and Pomeroy, which are more active.

Bituminous—A feeling of uncertainty prevades the local trade, although there has been a general advance in quotations on steam coal, due partially to the inability of shippers to get consignments through to this point. The car shortage has apparently reached an acute stage as regards the local situation, while operators are making every effort to rush shipments forward with the utmost dispatch. Because of the particularly bad conditions prevailing in West Virginia in this respect, many of the miners there are reported to be leaving for other districts where the situation is more favorable. As a result of these conditions, prices have advanced, both Hocking and Pomeroy lump now being quoted at $2. Three quarter Hocking is selling at $1.65, mine-run $1.35, and slack at 90c. Domestic grades remain practically unchanged, with the exception of Pomeroy and Hocking lump, and Pocahontas lump and egg is in a little better supply, while the demand is not so heavy as was the case a week ago.

The market is now quotable on about the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump.	$1.75	....	....	....	....	$2.75	$2.50
Egg...........	1.75	....	....	....	....	2.75	2.50
Nut...........	1.40	....	....	....	....	....	1.75
Steam lump....	1.50	....	....	....	....	....	....
¾-in. lump......	1.35	$1.35	$1.65	1.50	1.50	....	....
Mine-run.......	1.25	1.25	1.35	1.25	1.25	1.60	....
Slack..........	0.90	1.00	0.90	0.85	0.85	....	....

Anthracite—The hard-coal situation has not changed materially, the demand being less at the moment, if anything. All grades appear to be in plentiful supply, including stove coal, but jobbers are asking premiums in some instances.

Coke—Connellsville, 72-hr. coke is quoted at $3, with Semet Solvay at $3.25, and gashouse at $3.10, all f.o.b. ovens.

HAMPTON ROADS

Heavy demand for coal Coastwise and foreign. Large movement from all piers. Virginian Ry. breaks all previous records for heavy dumpings.

Business from Hampton Roads for the week has been brisk particularly in coastwise, foreign and bunker shipments. There has been a good supply of steamers, barges, and schooners all week which has enabled the piers to work almost continuously. The demand for coal continues good and in addition to shipments of Pocahontas and New River there has been a fair movement of the high volatile grades.

There have been some spot sales during the week, and at a price said to be around $3 but exact prices have not been obtainable; this quotation was for New River and Pocahontas. There has been little change in prices for high volatile coals although the demand is better than it has been for some time.

During the month of October just ended a total of 971,270 tons of coal were dumped over the Hampton Road Piers. The N. & W. Ry. led with a total of 437,787 tons over the Lamberts Point piers, the Virginian Ry. was second with 304,779 tons from Sewalls Point while the C. & O. Ry. dumped at Newport News 228,704 tons. The month of October has been a record one with the Virginian Ry, their best previous dumping having been made in September when 300,386 tons went over the Sewalls Point piers.

LOUISVILLE, KY.

Producers optimistic in spite of a general slowing down in business. Car supply better. Illinois Central places heavy contract with western Kentucky operators. River movement improving.

The continued active demand for domestic grades and the slowing down of the call for steam coal have been the features of the local market. Eastern Kentucky operators seem to feel that the outlook in this immediate section is somewhat brighter than the general situation would indicate, and they will be able to market most of their steam grades without serious difficulty. The active demand for domestic coal has kept the operators cheerful, and they feel optimistic regarding the situation in spite of the relatively slower call for steam coal. With prices on domestic grades at current figures, the operator who is able to get out a capacity production has little to worry about, even though his business on steam coal is not what it might be.

The car situation has been easier of late, some of the operators being able to work full time, as against an average loss of two days a week, which was noted from Sept. 15 to Oct. 15. The improved situation in this respect apparently reflects a slack call for equipment elsewhere. However, few are inclined to feel pessimistic especially when sufficient orders are on their books to enable the equipment to be used to good advantage. The adoption of a contract between western Kentucky operators and the Illinois Central whereby that road is to take its coal for the ensuing year from the mines on its lines has been an encouraging development of the week. The Illinois Central is one of the largest buyers of coal in the South. There has been a good movement of river coal from Pittsburgh and West Virginia of late. Seasonably cool weather has had the effect of increasing the retail trade, and business with most yards is excellent.

Prices f.o.b. mines are quoted on eastern Kentucky as follows: Block, $2.35@2.50; block and lump, $2.10@2.25; round, $1.70@1.90; nut and slack, No. 1, 70@80c.; No. 2, 50@60c. Western Kentucky coal is being offered on a f.o.b. mines basis as follows: Lump, $1.35; egg, $1.25; run-of-mine, $1; nut and slack, 65c., and pea and slack, 35c.

BIRMINGHAM, ALA.

Both coal and coke still quiet and showing little improvement. Smithing coal about the same as last week. Furnace and foundry coke dull. Little buying in pig iron.

This week shows little change over last week, either in lump or steam coal. The market is quiet, especially on steam grades, and unusually so for this season of the year. Smithing coal is practically the same, with probably slightly larger sales. There is nothing doing in the furnace and foundry cokes, except in small lots. Prices though are satisfactory. Little buying was done in pig iron, and the price was a shade under that of last week. A week or ten days of good cold weather will materially aid business. The car supply shows little improvement.

NEW ORLEANS

Formal opening to navigation of Warrior River. Rise in Ohio releases large shipments for New Orleans. Storage capacity doubled.

Representatives of every coal company maintaining offices locally attended the "Open Warrior" celebration last week. By the successful voyage of a self-propelled barge 200 ft. long and 32 ft. wide up the Tombigbee and Warrior Rivers at the period of lowest water, one step in the realization of the project to bring coal to New Orleans harbor has been proved. The trip was made under adverse conditions due to the fact that two of the Government locks in the Tombigbee are uncompleted. Borden Covel, general manager of the Northern Coal Co., of Boston, has organized a subsidiary company for the marketing of coal that will be handled by the new barge line. The new company is known as the Lake Borgne Coal Co.

There was much rejoicing in New Orleans last week when the stage of the Ohio River permitted the releasing of 155,000 tons of coal for this city. Stocks in the yards of the northern companies were becoming dangerously low, and there was no attempt made to conceal the satisfaction in the early rise. Provisions are being made for storing double the usual quantity of coal this winter.

CHICAGO

Demand continues strong with prices firm and high on some grades. Boom in Franklin County coal. Supply of anthracite still inadequate. Volume of business in Springfield district increasing. Car supply and low temperatures chief factors.

Chicago market conditions are on an exceptionally satisfactory basis with practically all prices firm and some at unusually high levels. Low temperatures and further tightening in the car supply have contributed chiefly to this situation.

Reports from various sources indicate that there has been heavy buying in anticipation of severe weather this winter. There has been a boom in the Franklin County coal district. Orders have been so plentiful that the price for lump, egg and No. 1 nut has been boosted in nearly all instances to $2.25, the mines. A few companies, however, still adhere to the old price of $2. Many operators in this field are oversold and will have a heavy run of business for some time. A larger movement of splint coal in box cars has been noted. Requirements by owners of flat buildings and others have increased the demand for smokeless coal. The minimum price on mine-run is $1.40, while on spot sales, prices ranging from $1.50 to $1.60 have been obtained. Lump and egg vary from $2.25 to $2.50.

Dealers are not obtaining sufficient anthracite to meet demands. Box cars are now being used to haul it to Chicago as a result of a shrinkage in the supply of open equipment. Quotations on the various sizes are firm with little or no discussion about premium prices. Carterville operators are retaining their $2 level on all sizes except No. 1 nut which is commanding as high as $2.25.

In the Springfield territory the volume of business is showing a consistent increase. Domestic lump is selling at $1.75 and steam lump at $1.25, the mines Shipments of Hocking to this market have been reduced and with additional orders from country points the price list has been strengthened; price at the mines for 1¼-in. lump is $1.75. The larger sizes of Indiana domestic lump are selling here at $1.75. The market for byproduct coke is firmer and there is an increasing demand for gas coke.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.57	$3.05@3.30	$2.52	
Steam lump	2.07		2.07	
Egg		3.05@3.30		$4.30@4.45
Mine-run	1.92	2.40@2.55	1.87	3.45@3.55
Screenings	1.12@1 22	1.55@1.80	1.12@1 22	

Carterville prices are: Lump, egg and No. 1 washed, $3.05; No. 2 washed, $2.65.

Harrisburg quotations are: Domestic lump and egg, $3.05; steam lump, $2.65@2.30; mine-run, $2.40@2.55; screenings, $1.55@1.80; No. 1 nut, $1.75@1.80; No. 2 nut, $2.55@2.80.

Coke—Connellsville, $5.50; Wise County, $5.25@5.50; byproduct, egg and stove, $4.90@5; byproduct, nut, $4.95@5.10; gas house, $4.65@4.75.

INDIANAPOLIS

The weather is mild and is affecting the volume of trade. This has had the effect of tempering prices in spots. The car situation has been relieved somewhat but operators are still nervous.

The weather continues rather mild, interfering materially with a large consumption of coal, especially domestic grades. While the retailers of the city have the same prices presumably, it is said that at least one large yard has been cutting 25c. under the prevailing scale, in order to accelerte the movement into cellars. It is predicted that it will be hard to maintain uniformity in prices unless some real winter weather arrives. Stocks are ample and there are plenty of orders yet to be filled. The railroads are making some headway in relieving the car shortage but operators fear it is only temporary. Some factories, not being able to get deliveries from their usual source of supply have had to go into the open market.

Eastern bituminous coals are selling at retail in this city at $4.75, but an occasional dealer quotes $4.25; anthracite is $7.75@8.50, according to size, Pocahontas $5 to $6; Indiana lump, $3.50; Brazil block, $4.25. One yard advertises: " ton of good coal, delivered, $2; guaranteed to give satisfaction." Inquiry develops that it is nut coal, taken out of screenings over 1½-in. screen.

ST. LOUIS, MO.

Market conditions improving. General advance in domestic prices caused chiefly by car shortage and increasing country business. Immediate future looks optimistic.

The market has been somewhat slow until the beginning of the present week when it seemed to pick up some. There was apparently no reason for this other than business has been gradually getting better in the country districts, although it was predicted a week or ten days ago that after the first of November the demand for domestic coal would drop off.

Car shortage conditions have been unusually severe the past week, the Illinois Central and the C. & E. I. about two days, and the Iron Mountain the same. The Southern Railway and the M. & O. are the joke roads when it comes to car supply, for if their mines get one day a week they are lucky. The Wabash is also in bad shape. The B. & O. is perhaps in the best condition of all roads entering East St. Louis.

The prevailing market is:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump				$1.15@1.25
3-in. lump			$1.60	
6-in. lump	$1.75 @ 2.00		1.75	1.40@1.50
Lump and egg	1.85 @ 2.15	Over sold		
No. 1 nut	1.50 @ 1.75			
Screenings	0.40 @ 0.50			0.10@0.20
Mine-run	1.10 @ 1.20			
No. 1 washed nut	2.00		1.40	
No. 2 washed nut	1.40		1.60	
No. 3 washed nut	1.20			
No. 4 washed nut	1.05			
No. 5 washed nut	0.30			

KANSAS CITY, MO.

Unfavorable weather and trade quiet. Strike in the Colorado fields may affect the local markets.

With the weather unfavorable, the coal situation has undergone no change of consequence during the past week. The expected 25c. advance failed to materialize, due to the fact that the cold weather was short-lived. The increase, however, will probably come within the next few weeks, being regarded as inevitable.

There has been no great change in the Colorado situation and that coal will be missed by Nebraska, Colorado, and Kansas consumers. Dealers have comparatively little Colorado coal on hand and a few cold days will see their stocks narrowed to nothing. In the meanwhile, operators of Kansas and Missouri are working full time. All lines are moving fairly well though Cherokee nut and one or two other grades have shown signs of weakening, rather than gaining strength.

PORTLAND, ORE.

Labor troubles in both Colorado and British Columbia affecting the Pacific Coast markets. Removal of import duties will not change the situation locally.

Owing to the strike in British Columbia Utah mines are now shipping coal into Seattle, 2500 tons having been forwarded into that city since the opening of the season. Heretofore, Seattle has drawn its coal supplies largely from the British Columbia mines. The Washington mines are shipping coal into British Columbia cities and some even finds its way into Alaska. As a result of the strike in the Colorado mines, the car situation is easier here than for some time and no trouble is now experienced in getting coal from Utah or Wyoming. Receipts are lighter this month than they were during September. Local business is a little quiet for the time being, but has been good for several weeks past. Prices have shown no change during the month.

It is reported that 900 tons of coal will arrive here soon on a vessel from Australia. Dealers do not regard the removal of the 45c. per ton duty on coal as affecting values here this season at least, owing to the high freight rates, but it may be of some consequence next year.

COAL FREIGHT DECISIONS

Sheridan Chamber of Commerce vs. Chicago, Burlington & Quincy et al.

Rehearing. The original hearing dealt with rates on coal from Sheridan, Wyo., to destination on the Chicago & North Western in Nebraska and South Dakota, on the Chicago, Milwaukee & St. Paul in South Dakota, and on the Northern Pacific east and west of Billings, Mont. Upon the rehearing the Big Horn Collieries Co., Owl Creek Coal Co., and Board of Railroad Commissioners of Montana were granted leave to intervene. The first two ask that the rates from mines near Kirby, Wyo., be adjusted so as to bear a proper relationship to rates established from Sheridan to destinations in the three cases under consideration. **Held:**

Sheridan coal should move to points upon the Chicago & North Western and the Pierre, Rapid City & Northwestern herein involved at the same rate enjoyed by Hudson. Proper routing for coal moving from Sheridan to these destinations is prescribed.

Joint rates should be established from Kirby to destinations on the Chicago & North Western and the Pierre, Rapid City & Northwestern herein involved no higher than $1 above the rates prescribed from Sheridan.

For distances within 500 miles of the point of origin joint rates should be established from Sheridan to points on the Northern Pacific east of Billings not more than 40c. over those prevailing from Red Lodge, and to points west of Billings 55c. over Red Lodge, and from Kirby to points on the Northern Pacific east and west of Billings joint rates should be established not more than 65c. over the prevailing rates from Red Lodge. To points between 500 and 600 miles from Sheridan the differentials suggested as compared with rates from Red Lodge should be decreased 10c., and for each 100 miles additional a further reduction of 10c. should be made in the differential.

It is possible for a carrier to discriminate unjustly and unlawfully against a point which it does not reach over its own rails.

The difference in cost of production cannot be recognized as a basis for the adjustment of freight rates between different localities.—**(28 I. C. C., 250.)**

FOREIGN MARKETS

GREAT BRITAIN

Oct. 24—The market maintains a firm tone for admiralty list coals, which are well booked for prompt shipments. Ordinary Monmouthshire large coals are still plentiful. Best Cardiff smalls are in better demand, and inferior classes freely offered at cheap prices. Quotations are approximately as follows:

Best Welsh steam	$4.68@4.80	Best Monmouthshires	$3.96@4.08
Best seconds	4.44@4.62	Seconds	3.72@3.90
Seconds	4.26@4.44	Best Cardiff smalls	2.52@2.64
Best dry coals	4.32@4.56	Seconds	2.34@2.46

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, exclusive of wharfage, and for cash in 30 days.

British Exports—The following is a comparative statement of British exports for August and the first eight months of the last three years, in long tons:

	August		8 Months		
	1912	1913	1911	1912	1913
Anthracite	237,015	254,811	1,762,204	1,770,490	2,189,491
Steam	4,439,596	4,467,111	34,735,081	32,810,201	39,755,473
Gas	963,176	996,158	7,743,871	7,755,023	8,583,712
Household	154,705	175,022	1,098,581	1,146,393	1,335,833
Other sorts	283,067	304,078	2,278,953	2,268,316	2,653,279
Total	6,077,559	6,197,180	47,618,690	45,750,423	54,517,788
Coke	97,679	125,357	711,697	680,713	838,055
Manufactured fuel	125,373	179,041	1,236,582	1,115,631	1,542,365
Grand total	6,300,611	6,501,578	49,566,969	47,546,767	56,898,208

NATAL

The British Trade Commissioner for South Africa furnishes in the "Board of Trade Journal" the following data rebarding the coal industry in Natal for 1912:

The output of coal from Natal collieries in 1912 was 2,472,100 long tons as compared with 2,394,200 tons in 1911 and 2,296,700 tons in 1910. The total for 1912, although more than in former years, is not considered satisfactory in view of the number of collieries producing and the markets which may be considered as within the sphere of Natal's trade. The increase of exports to Cape ports is more than sustained, and whereas in 1911 the amount sent to Union ports was 270,300 tons, that of 1912 totalled 403,000 tons.

Two Units in Tandem, used as a 30-Ton Locomotive.

The Largest Mine Locomotive That Has Ever Been Built

was recently installed at the mines of the Charleroi, Pa., Coal Works. This locomotive (*Baldwin-Westinghouse Barsteel type*) weighs 30 tons, and, it is estimated, can haul 100 cars, each loaded with three tons of coal, over the local grades, which are two miles long and largely against the load.

The locomotive consists of two units which can be separated and used as 15 ton locomotives if desired.

The use of two units in tandem distributes the weight over 8 wheels instead of 4, and hence the locomotive has great tractive power and also is easier on the track than if the weight were more concentrated.

The **Barsteel** frame construction gives ready access for inspecting, oiling, replacing brake shoes, adjusting brake rigging, etc., and also allows excellent ventilation to the electrical apparatus.

If you want to get out maximum tonnage at the least expense and in the shortest time ask for the advice of our mining experts.

One Unit, used as a 15-Ton Locomotive.

The Tammany Tiger and Advertising

The Weekly Ad-Talk Page

Robert Adamson, who was the late Mayor Gaynor's private secretary and who handled the Fusion campaign in the recent New York City election, made a speech the other night before the Advertising Men's League of New York. It is interesting to note how he gives the credit for the now famous Fusion victory to advertising.

"The press simply elected our ticket," said Mr. Adamson, "that's all. All the other work would have been in vain but for the newspapers. The campaigns of the future will be largely decided by the light thrown upon them by the newspapers.

"Our campaign methods were almost as out of date as Tammany Hall's itself. Three-quarters of the money spent was wasted. Banners, buttons and red fire were useless. They don't change a vote. The money spent on the day of election is also wasted.

"The newspapers were complained of a great deal, but so far as I can see there was no unfairness—they printed fairly all statements issued, and left it to the public to decide where the truth lay. There was probably a great deal of exaggeration and injustice in this campaign, but a correct decision was reached.

"The press has no power except on the side of the right. It can no more write you down or write me down than it can the Palisades. Our problem was to convince the people that we had the side of the right, and not until the press began to present the facts did the people begin to see."

Thus have the great political parties of the country come to realize the tremendous force and value in truthful advertising.

As William C. Freeman, addressing the same gathering the other night, said, "There has been a general clean-up. The old time things that faked and lied are dead. In old days the proportion of bad advertisements to good advertisements was 90 per cent.; now it is just the reverse."

Advertising is so general, so thoroughly read, and so thoroughly understood today, that anyone who is untruthful in his advertising, is committing business suicide.

One of the greatest commercial assets of the manufacturers of this country, is the universal confidence in advertising—

And this is true, simply for the good old reason we have told you before—namely, that it pays to advertise only in proportion as it pays the readers to read the ads and buy the advertised goods.

Two Recent Coal-Mining Disasters

By R. Dawson Hall

SYNOPSIS—The need for more safeguards against explosions. Sprinkling with a water car and loading out dust are only palliatives. With the coal dust loaded out is often a great deal of available stone dust, which would tend to prevent an explosion. Some more details relative to two recent explosions at Senghenydd, Wales, and Dawson, N. M.

⁂

The recent disasters at Senghenydd and Dawson renew the conviction that there remains much to be done before safety can be assured. The steady reduction of accidents in American mines since 1907 is this year to be turned into an increase, and the fatalities will in all probability, easily explained the 5 per cent. excess over last year's figures, but the Dawson explosion has shown that the orderly procession of accident reduction is liable at any time to be disturbed.

It is important to remember that while the Bureau of Mines has proved to almost all the bituminous coal operators that coal dust is dangerous, unfortunately that is only a part of the necessary propaganda. Equally important is it to find a cure, and almost as necessary is it to show that the water car, especially when only carried into headings, is merely a palliative and not a *remedy* for dustiness in a mine. There are many people who have not been assured that dampening a mine with steam can augment not only per thousand men employed, but per million tons mined.

The Mine and Town of the Lewis-Merthyr Collieries, Ltd., at Senghenydd, Wales, Where the Recent Explosion Occurred

Increase in Death Rate

The returns of the Bureau of Mines for the present year, from January to August, showed an increase of 83 deaths or 5.1 per cent. over the fatalities of the previous year. As the tonnage increase has probably been 15 per cent., a decrease in death rate per million tons mined would probably be shown for the first eight months. Unfortunately, the accident in the Dawson mine makes such a desirable reduction for the whole year almost impossible.

The steadiness with which the men have worked in the mines, and the increased number of them employed be done without adding to the danger by increasing falls. There are many operators who do not believe in systematic and extensive stone dusting as a cure for explosions, and there are also a great number who believe it may cause tuberculosis. Also few there are who know that abroad it has long passed from a scientific fad to a general practice, and that at least two manufacturers are recognizing the need for rock pulverizers in coal mines by making machinery for that express purpose.

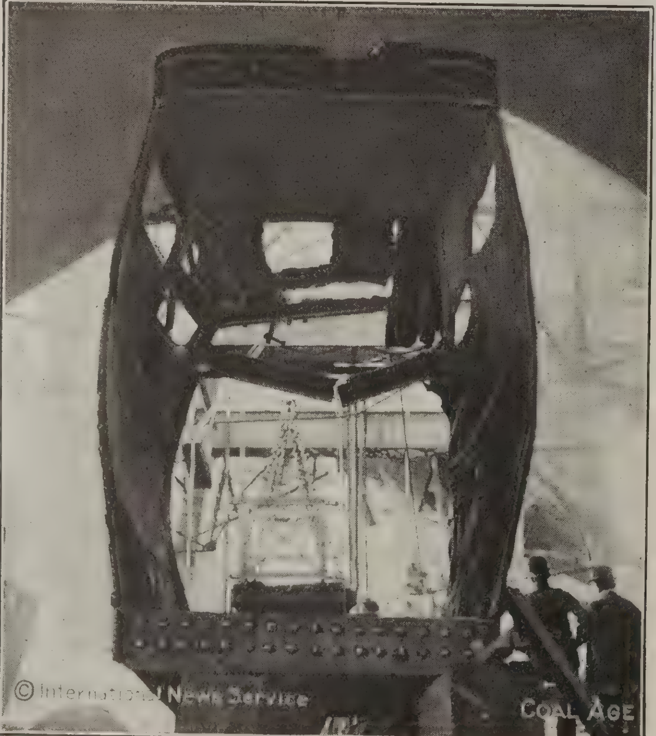
It is these uncertainties, or lack of information, which make operators slow to adopt the right correctives. There is no question among people who are informed that moistening has never destroyed a mine roof, that shale dust spread on mine headings has never and never will cause tuberculosis, that a sufficient quantity of reasonably non-

Scene of the Explosion at Dawson Mines of the Stag Canyon Fu

carbonaceous stone dust will put out an explosion, and that moistening the air and stone dusting should be practiced in every mine making an explosive dust, in fact, in almost all bituminous mines.

Dangers of the Half Measures Frequently Advocated

In any mine the use of electric shot-firing from the surface, like other excellent practices, has disadvantages, because it is likely to make the men disinclined to be on their guard. They are apt to argue that at the worst an explosion will only cause a property loss.



The Cage Which Was Blown from the Lancaster Shaft at Senghenydd

Unfortunately, a small explosion of gas or a mine fire may easily start a larger explosion if the mine is not safeguarded against such an event. Probably at the Dawson mine the principal reliance was on loading out dust and sprinkling it with water. Even when done with all due diligence, such an action can only serve to reduce the violence of the explosion, and may remove much of the motor-braking sand and powdered roof rock by which the force of an explosion would be lessened, leaving only freshly mined coal of a most dangerous description.

Water sprinkled on dust in the mine is probably quite unequal to the task of stopping an explosion once well under way. It is chiefly valuable where the explosion starts.

A little dust is as dangerous as a great deal, in fact it may be more dangerous, as an excess of coal dust, like an excess of methane, may render an explosion less severe. These are reasons why cleaning headings and spraying them will fail to give perfect immunity from explosions.

Senghenydd Explosion

The Senghenydd explosion is the worst England has ever experienced, as far as the number of its fatalities is concerned. It is second only to that at Courrières. The mine was known to be dangerous, for on May 24, 1901, an explosion occurred by which 81 men out of 82 in the pit were killed. The recent catastrophe occurred at 8:20 a.m., the men having gone to work at 6 o'clock, and this fact may have some relation to the cause of the accident. Most of the explosions in the United States have happened early in the morning and been caused by gas exploding when a man entered a place which had not been properly ventilated during the idle period preceding. According to the *London Times,* the hours of working were

NG VALLEY OF RAIL CANYON, TRAMROADS, RAILROAD TRACKS AND HOUSES

from 6 a.m. to 2 p.m., 2 p.m. to 10 p.m. and from 10 p.m. till 6 a.m., the night or repairing shift employing only a few men. This explosion need not have resulted from a lamp; a spark from a pick would be sufficient.

The Universal Colliery at Senghenydd, Glamorganshire, Wales, was owned by the Lewis-Merthyr Consolidated Collieries Co., Ltd., Lord Merthyr being chairman. The explosion was so severe that it blew the galvanized iron roof off the head house and broke the sheaves of the downcast, or Lancaster shaft, the direction of the explosive violence apparently opposing the intake current. The head of the top cageman was cut or blown off and his assistant was seriously injured. The cage was badly damaged, as can be seen in the photograph. The Lewis-Merthyr Consolidated Collieries Co. owns seven mines and produces steam coal for the British navy. The two shafts, Lancaster and York, employ 2200 men, according to one authority and 1700 according to another.

RESCUE TEAMS AT A MINE OF THE STAG CANYON FUEL CO. DR. ROBERTS, OF THE UNITED STATES BUREAU OF MINES, INSPECTING MAPS

Fortunately, these men work in three shifts, and of those actually in the mines over half were saved, as they worked in the 6-ft. and 9-ft. seams in the east district, which are ventilated by a separate air current. They were brought out by the York shaft and numbered 489 men.

The Rescue Work

Edward Shaw, the general manager, at the head of a rescue party went to the bottom of the shaft. About 300 ft. in on the main haulage road he found a blazing fire, but went on nevertheless amid the smoke and fumes, only to be driven back, so blinded that he was unable to see during the remainder of the day. The fire was put out, and the rescue work proceeded slowly, but other fires were discovered, and recovery of the mine was delayed by the necessity for quenching or smothering these fires. About 18 men were rescued from the Britannic section of the mine, but no others were saved. In all 935 entered the mines in the morning and 434 were killed, including the cageman and a rescuer.

The following rules were adopted for rescue work:

1. All exploration work must, as far as is practicable, be carried on through the intake airway.
2. No person, except officials of the mine or responsible leaders of shifts shall enter any return airway or unventilated place.
3. When unexplored roads are about to be entered, it must be done with fresh air.
4. All roads which are unexplored must be "crossed off" for the time being.

Mine at Dawson Caved In as Result of the Explosion

Apparently the rescuemen appear to have had some trouble with their apparatus. "In one place," says the *Colliery Guardian* (to which we are indebted for most of this information), "nine members of a rescue brigade wearing breathing apparatus were overcome and with difficulty brought out by men not so protected."

Dawson Explosion

The number killed in the disaster at No. 2 mine of the Stag Canon Fuel Co., Dawson, N. M., is still believed to total 263 men. It is expected that the government car will continue in Dawson for two or three weeks, making a careful study of the causes. Mining work was resumed Oct. 27 in No. 4 mine, which is on the opposing side of the Rail Cañon.

The coal in Dawson No. 2 mine contains 37.93 per cent. of volatile matter, 45.08 per cent. of fixed carbon, 2.17 per cent. of moisture and 14.82 per cent. of ash. It is a highly bituminous coal. The Merthyr coals in England run about 18 per cent. volatile matter and are, therefore, only one-half as bituminous as those in Dawson. It is due to the Stag Cañon management to state that two days before the explosion, Inspector Rees H. Beddow examined the mine and declared it in good condition. The ex-territorial inspector, Jo. E. Sheridan, spoke most highly of the management.

⁂

Recent Legal Decisions

By A. L. H. Street*

Reasonableness of Demurrage Charge—A rule of a railway company, operating in Kentucky, imposing a charge of $1 a day for detention of cars more than 48 hours, not including Sundays and holidays, after the cars have been delivered for loading or unloading is valid and enforceable (Kentucky Court of Appeals, Louisville & Nashville Railroad Co. vs. Waller & Co., 159 Southwestern Reporter 590.)

Liability of Carrier for Delay on Connecting Line and Measure of Damages—Under the Carmack Amendment to the Interstate Commerce Act, a railway company which receive a shipment of coke, or other freight, for carriage to a point in another state is liable for damages sustained by the consignee, through unreasonable delay of a connecting carrier in making delivery, of the first carrier contracted for through shipment. A clause in the bill of lading covering such a shipment, providing that, in case of loss of the shipment, its value or cost at the point of shipment shall govern settlement of the shipper's claim for damages on account of the loss, does not affect the measure of damages recoverable on account of delay in transportation. (Oklahoma Supreme Court, Ft. Smith & Western Railroad Co. vs. Awbrey & Semple, 134 Pacific Reporter 1117.)

Effect of Pennsylvania Mining Act—Although, under the laws of Pennsylvania, a miner cannot recover from his employer for injuries solely caused by the mine foreman's failure to supply props to support a mine roof, the operator is liable if it appears that the mine superintendent was notified of the foreman's failure to furnish props on request, and promised to furnish them immediately. A miner who has requested props is not guilty of contributory negligence as a matter of law in cutting and loading coal before the props are furnished, if he sounds the roof and it appears to be safe, notwithstanding the section of the Pennsylvania Mine Law which prohibits a miner from working where there is danger from loose roof or sides, until props are supplied. (Pennsylvania Supreme Court, Collins vs. Northern Anthracite Coal Co., 88 Atlantic Reporter. 75.)

Construction of Mining Leases—In construing a coal mining lease, its language should be interpreted most strongly against the grantor; and the intention of the parties is to be ascertained by reference to the entire instrument, and not to disjointed parts of it. Right to use the premises in all ways which are customary in conducting coal-mining operations is implied, in the absence of express provision to the contrary. Where adjoining tracts of land were leased to a company for the purpose of mining coal and manufacturing coke thereon, the company was entitled to construct buildings on the premises for future use of its employees, and, pending such use, could lease the buildings to another company without being required to account to the lessor for rents received on that account. (West Virginia Supreme Court of Appeals, Stonegap Colliery Co. vs. Kelly & Vickers, 79 Southeastern Reporter, 341.)

Mining Company's Liability Concerning Defective Track—In a suit by a coal miner for injury to him, sustained while handling a car on a gravity track in a mine, caused by the car jumping the track, it was improper for the court to take from the jury the question whether the mining company was negligent in failing to maintain the track in proper condition, if there was any evidence to sustain a finding of negligence, even though the weight of the evidence might seem to preponderate in favor of the company. The miner was not guilty of contributory negligence, barring recovery for the injury, merely because he knew the track was in a defective condition, unless a miner of ordinary prudence would have refused to continue work until the track should be repaired; he having received assurance that the repairs would be made promptly. (Kentucky Court of Appeals, Fusion vs. New Bell Jellico Coal Company, 159 Southwestern Reporter 619.)

*Attorney at Law, St. Paul, Minn.

A Significant Resolution

At a meeting of the Conciliation Board held in Wilkes-Barre, the following resolution relative to the so called button strikes was adopted.

> Whereas, the testimony shows that continued strikes have occurred in violation of the award of the Anthracite Coal Strike Commission and the agreements subsequent thereto, and
>
> Whereas, new trouble has been caused by high-handed and arbitrary action on the part of certain committeemen in the forcible collection of union dues in violation of any rights given by the award or any subsequent agreement, and
>
> Whereas, this action has caused serious loss to the G. B. Markle Co. and loss of discipline in the operation of its mines;
>
> Therefore, be it resolved, that the company be directed to take such steps as are necessary to enforce proper discipline by the discharge from its services of the parties guilty of causing this trouble in open violation of the agreement to which they have subscribed; and
>
> Be it further resolved, that Hugh Gallagher, Patrick Sweeney and Michael Laputka be directed to appear before this board at the next meeting, to be held Nov. 17, 1913, to explain their alleged actions in violation of the agreement and the instructions given them at the meeting held Sept. 15, 1913.

This resolution was the outcome of the complaint of the G. B. Markle Co. that since their last case relative to button strikes, heard Sept. 15, there have been several similar strikes.

New Mining Legislation in Tennessee

At least two important mining bills have just been passed by the extra session of the legislature in Tennessee, September, 1913. The first of these entitled Chapter No. 24, Senate Bill 192, is:

> An act to require the operators of coal mines in this state to provide and keep suitable appliances, bandages, dressings and medicines for the first aid to the injured in said mines.

The second, entitled Chapter No. 38, Senate Bill No. 191, is:

> An act to provide for the organization and maintenance of a trained body of men for the preservation of lives and for rescue work in case of explosion, or other serious mine disasters, and to provide the conditions, requirements and regulations under which this organization may be formed and maintained.

The chief mine inspector, George E. Sylvester, has just sent out the following circular letter to all the mines in the state, drawing the attention of mine officials to the new legislation and its requirements:

> Nashville, Tenn., Oct. 18th, 1913.
>
> Dear Sir:
>
> I inclose herewith amendment to the mining laws, passed at the extra session of the legislature, September, 1913. Only two of the bills, namely, those pertaining to first aid and mine rescue are, strictly speaking, mining bills. The bill relative to a two-week pay-day, although general in its character, would apply in some cases to mines and consequently has been included for your information.
>
> The bill requiring the keeping of first-aid supplies, at mines, goes into effect at once. Many of the mines have already complied with these requirements, and I would suggest that those who have not done so give it immediate attention.
>
> The American Red Cross and Johnson & Johnson both have on the market "Industrial Cabinets" in a neat and convenient tin box, which sells for about $6 and meets the requirements of the law. Any suitable stretcher, whether obtained from these supply people or made at the mine, will serve the purpose.
>
> This department is very much interested in the matter of seeing these regulations carried out in all cases, and this will be a subject on which the district inspectors will report at each inspection.
>
> Mine-Rescue Bill: As will be seen there is nothing mandatory in this bill. It is recognized by the best mining men that few, if any, mines are entirely immune from the possibilities of a disastrous mine fire or an explosion.
>
> The value of the oxygen apparatus is also recognized in such an emergency. The maintenance of such apparatus must be considered along the line of insurance; and the object of this bill is that the state shall assist and coöperate with the mines in this matter, in order that an effective organization may be available in emergencies, and it is hoped that some of the larger mines or groups of mines will interest themselves in this matter.
>
> The bill has the strong approval of this department, and I should be glad to take the subject up in detail with all interested parties.
>
> Very truly yours,
> GEO. E. SYLVESTER,
> Chief Mine Inspector.

A third bill, entitled Chapter No. 29, House Bill No. 65, is of less importance, but applies alike to mines and other industries. It is:

An act to require all persons, corporations, companies, firms, or partnerships, to have two regular paydays each month.

Coal Mining Institute of W. Va.

Between 250 and 300 of the leading coal men of West Virginia will be in Charleston, on December 8-9-10. The occasion will be the semi-annual meeting of the West Virginia Coal Mining Institute. The members of the Institute will be addressed on the first day by Governor Hatfield.

Because of the subjects to be discussed and the persons discussing them, this will be one of the most interesting meetings of the Institute for several years.

Chairman Lee Ott, of the Public Service Commission, will read a paper on the "Operation of the Workman's Compensation Law." "The Selling Price of Coal" will be discussed by R. A. Colter, of the C. G. Blake Coal & Coke Company of Cincinnati, and George F. Parker, of New York, will talk on "Public Sentiment."

The Rev. Thomas C. Johnson, of Charleston, has consented to deliver an address on the new Prohibition Law and its probable effect upon the miners of West Virginia, while former Governor Wm. A. MacCorkle will present to the Institute the result of his study of the "Effect of the Panama Canal on West Virginia Mining Operations."

One of the foremost chemists of the country, Dr. L. C. Jones, of Syracuse, New York, will read a paper on "Chemistry of Coal as Applied to Coke Making and By-Product Ovens," while John G. Smythe, chief engineer of the Consolidation Coal Company of Fairmont, will read a paper on the use of the panel system in mining. Earl Henry, Chief of the Department of Mines, and John Laing, former Chief, will discuss the work of that department, while R. S. Ord, of Maybeury, will tell of the "Advancement of Mining Methods in West Virginia," and Frank Haas, of Fairmont, will read a paper on "General Mining Conditions."

Neil Robinson, of Charleston, is the President of the Institute, and Prof. E. N. Zern of Morgantown, is the Secretary and Treasurer. The Vice-Presidents are: George T. Watson, of Fairmont, John Laing, of Charleston, R. S. Ord, of Maybeury, J. F. Healy, of Charleston, and J. C. McKinley, of Wheeling. The members of the Executive Board are the officers and Hon. Lee Ott, of Charleston; Prof. Clement Ross Jones, of Morgantown; Daniel Howard, of Clarksburg; J. J. Lincoln, of Elkhorn; J. B. Hanford, of Morgantown, and Frank Haas, of Fairmont.

A New Coal-Washing Table

The coal wasted, both in mining and preparation for market, has in recent years been the subject of much discussion by the public press, the Government and the coal-mining industry. The latter being the most vitally interested, has directed much effort to the perfection of ways and means for reducing this waste as far as possible. No expense has been spared to provide equipment that would save a few cents a ton provided the results obtained would justify the outlay.

Among the latest coal-saving devices to make its appearance is the Massco Coal Washing Table, placed on the market by The Mine & Smelter Supply Co., of Denver, New York, El Paso, and Salt Lake City. This firm having had long and varied experience in the reduction of metal-bearing ores, turned its attention to the problem of cleaning coal, since the basic principle underlying both processes is identical.

In metal-mining parlance this process is termed "concentration." It might with equal propriety be called "washing," which is the term generally used when applied to coal. The end sought is the same in both cases, since it is the segregation of the worthless matter from the valuable material. In ore washing this is the elimination of the gangue from the mineral, while in coal it is the separation of bone or slate, iron, sulphur, etc., from the purer fuel. This process is particularly desirable where coal is used for coking purposes in order to produce a coke with a low ash and sulphur content.

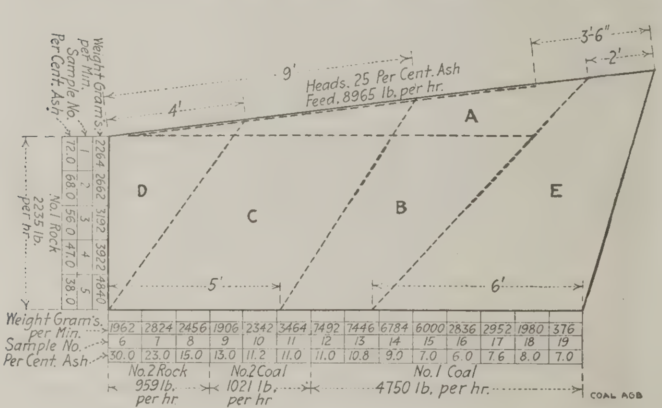

Chart Showing Result of Test

Heretofore, coal washeries have resorted to the various types of jigs for cleaning their product, and while this method accomplished the purpose on the coarser material, it was impossible to clean the fines, until the advent of this coal-washing table. This machine bids fair to displace jigs in washeries where coal is prepared for coking or is too fine for cleaning in this type of machine.

The percentage of saving effected is greater than on jigs besides producing a cleaner product. The reason for this is obvious; since the finer the material is broken the more complete is the physical separation of the coal from the foreign matter, and it only remains to segregate the good fuel from the dirt. This is the purpose for which this table was designed, and which it well accomplishes.

Difference in Specific Gravities Utilized

In this apparatus, as in other coal washing machines, advantage is taken of the difference in specific gravities between coal and the ash-producing foreign substances, the latter being the heavier. The table consists essentially of a linoleum covered, riffled deck about 7 ft. wide, and 16 ft. long, transversely inclined and reciprocated endwise by a head motion mechanism. The crushed coal previously mixed with about three times its volume of water is fed onto this deck through a feed-box at the upper corner.

The pulp, as the mixed coal and water is called, in its passage across the deck stratifies in accordance with the specific gravities of the different particles, the heaviest seeking the lower level between the riffles, while the coal, or lighter particles, remain on top to be washed off the side of the deck by the cross flow of water. The heavier, or high-ash particles, are guided and advanced to the end of the deck by the head motion mechanism, and discharged as waste. This separation is visible at all times while the table is in operation, and susceptible of exact adjustment and easy control of the operator. When properly adjusted, little attention is required, and one horsepower is ample to drive each table. The capacity has been found to be from 4 to 6 tons per hour on coal broken to pass a ¼-in. ring.

The accompanying line drawing shows the relative grades of coal and refuse discharged from one of these tables in use at a washery of the Stag Canon Fuel Co., at Dawson, N. M. The product of this machine is a high-grade coking slack and a superior blacksmithing coal.

Samples were taken every foot around the table, and the figures designate the relative quantities discharged with their ash content. Note that zones *B* and *E* discharge the highest grade coal, also the major portion of the product; while zone *C* is a somewhat lower grade and a lesser quantity. Zone *D* discharges practically all the waste or rock, as indicated by the high-ash content of the product. The coal used on this run was particularly difficult to wash, since the bone, coal and rock graded into each other without showing any distinct line of demarcation.

Reference to the tabulated results of the test shown below will reveal that from a table fed with material containing 25 per cent. ash, 82 per cent. of the total weight was recovered, containing 12.4 per cent. ash. While no sink and float test data are available, the 82 per cent. saving of the total would doubtless represent from 95 per cent. to 98 per cent. of the recoverable fuel.

RESULTS FROM COAL WASHING ON MASSCO COAL-WASHING TABLE, STAG CANON FUEL CO., DAWSON, N. M.

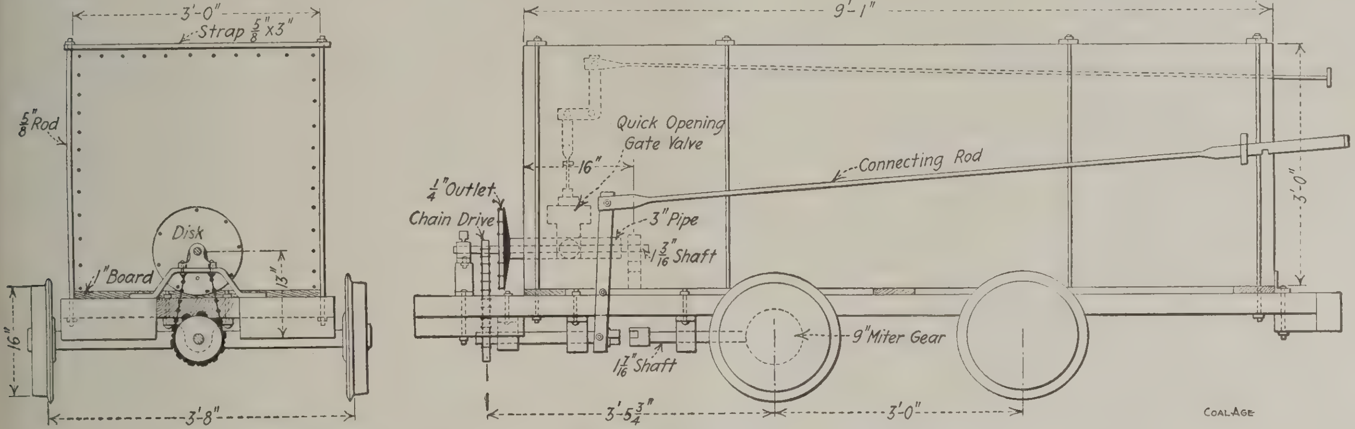
Product required for coke..........................12% ash and lower
Specific gravity of Coal 1.35....................Bone and ash 1.35 to 1.85
Dry weight of feed to table, per hr.................................8965 lb.
Assay of heads..25% ash
Product from table:
No. 1 Coal 53% of weight = 4651 lb. Average ash 9%
No. 2 Coal 11.3% of weight = 986 lb. Average ash 11.5%
No. 2 Rock 10.7% of weight = 938 lb. Average ash 22%
No. 1 Rock 25% of weight = 2390 lb. Average ash 52.7%
No. 1 and No. 2 Coal combined making product:
64.3% of weight = 5637 lb. Average ash 9.5%
No. 1 and No. 2 Coal and No. 2 Rock combined making product:
75% of weight = 6575 lb. Average ash 11.3%
No. 1 and No. 2 Coal and No. 2 Rock plus 641 lb. No. 1 Rock (Sample No. 5—38% ash) making product:
82% of weight = 7187 lb. Average ash 12.4%

It should be mentioned that the above material was too fine to be treated successfully in jigs, and prior to the installation of these tables represented a total loss. A run was also made upon dump material carrying 34.2 per cent. ash, and containing 46.5 per cent. of good coal running 11.1 per cent. ash. This was first screened and that which passed a ⅜-in. mesh was fed to the table at the rate of 7700 lb. per hr. The result of this test showed that 44.2 per cent. of the material fed to the table was recovered, containing 11.1 per cent. ash. This represented a recovery of 95 per cent. of the total amount of the commercially valuable content of the dump.

⁂

A Mine Sprinkler

The Boardman mine washer, illustrated herewith, is not an appliance for separating refuse from coal, but a device for attaching to a water-tank car whereby the air in a mine may be purified of dust, and the floor, roof and sides effectively sprinkled, the power for the discharge being provided by the motion of the car and thus being ultimately derived from the tractive means used.



A Sprinkler Which Throws a Fine Spray over Roof, Sides, Floor and Brattices

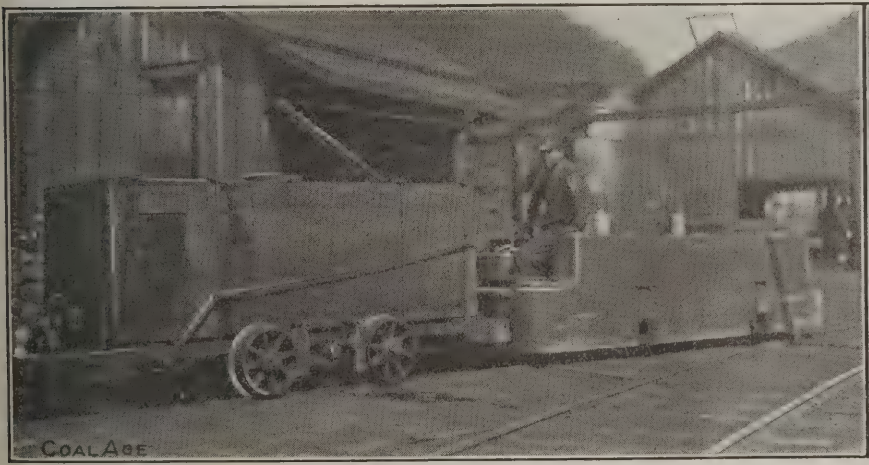


Fig. 1. The Mine Washer—At Rest

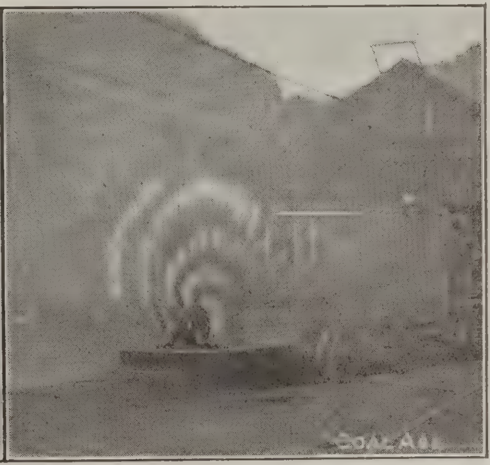

Fig. 2. Washer in Action

A 9-in. miter gear is provided on the rear axle of the car, this drives a shaft in the center of the underside of the tank. This shaft revolves a sprocket at the rear of the wagon and a chain passed round this sprocket actuates a bladed disk which, being fed with water, throws a continuous stream of atomized liquid in a circle, the radius of which, when its flow is unobstructed, is 25 ft.

The discharge of water can be regulated by a bell-crank from the front end of the car and, by a simple lever, the shaft connecting the rear axle with the spray disk, can be uncoupled.

Fig. 1 shows the tank car attached to a motor, but in many cases mules are used. When drawn by the latter power, the car can be taken into every part of the mine where a track is laid and to points where an explosion is likely to take place if the dust is not laid and well moistened.

Fig. 2 shows the tank car in motion and the fog it is throwing is the cause of the hazy appearance in the photo. A car which waters only the floor of a mine discharging its contents with but little force, in no sense atomizing it, may comply with the letter, but not with the spirit of the law, and protects neither the miner nor the operator. The mine washer is built by the Superior Supply Co., of Bluefield, W. Va.

⁂

A Record Production

The Truesdale Colliery of the D. L. & W. Coal Co. mined, prepared and shipped to market during October, 1913, 105,020.07 tons of coal, the total production for the month being 108,220.07 tons. This tonnage is a record production from one colliery for the anthracite field. This large output may be considered remarkable indeed when it is remembered that the first ton of coal prepared at this plant was shipped to market Nov. 15, 1905, a little less than eight years ago. The plant is operated electrically, the power being obtained from the Nanticoke central station, located near the Susquehanna River at Butzbach's Landing. The colliery is under the supervision of H. G. Davis, district superintendent; P. H. Devers, assistant district superintendent; Joseph L. Reynolds, outside foreman; W. E. Waters, William White and David M. Evans, inside foremen. The plant has a nine-hour day record of 5,729.07 tons.

A Mining Class in Alabama

Mine foreman William Crooks conducted a successful mining class of 12 members, last year, at the mines of the Pratt Consolidated Coal Co., Quinton, Ala. The membership represented different classes of mining men. Out of the eight members of the class who took the state examination at the close of the term, seven passed with credit.

The class this year has an enrollment of 18 men, among whom are two superintendents, one assistant foreman, one fireboss, a boss driver, bratticeman, trackman, timekeeper, shipping clerk, store manager. A noticeable feature is the absence of miners and mine laborers, while the interest shown by those engaged in the commercial end of the coal industry is commendable. An intimate knowledge of mining conditions and principles is always a benefit in all branches of the work—in the store, the office or the field.

Mr. Crooks this year is assisted by Supt. Hollis. The class and its teachers have the best wishes of Coal Age.

Company Store Limits Its Profit

A company store which supplies two coal camps a mile apart in territory tributary to the Virginian Ry. is the first mercantile establishment in recorded coal-mining history to make a horizontal reduction of 8 per cent. upon everything on its shelves because it was earning too big a profit. The president of the company has laid down the dictum that "if we can't make money on coal we had better quit." The store manager has been warned that he must keep inside a certain dead line of profits.

An English Syndicate in West Virginia

There are persistent rumors of a new, big consolidation in West Virginia, regarding which the *Boston News Bureau* has the following to say:

> Of interest to the security holders of New River Co. is the announcement from Richmond, Va., concerning the negotiations now in progress for the purchase by an English sydicate of important West Virginia soft-coal properties, including New River.
>
> The proposition is said to involve an investment of $30,000,000 by English capitalists headed by Peter D. Millory, of London. The negotiations on behalf of the mine owners have been carried on by an organization known as the West Virginia Syndicate, some of the members being: W. N. Page, of Ansted, W. Va., president, who was connected with the late H. H. Rogers in constructing the Virginian Ry.; Morgan Davis, Jr., of Scranton, Penn.; Judge Alden, of New York, and G. D. Penniman, of Baltimore, representing the Baltimore & Ohio.
>
> The properties to be acquired include nearly 100 collieries with an annual capacity of 8,000,000 to 10,000,000 tons of coal, and 550,000 acres of coal land. These plants are at present shipping annually about 4,000,000 tons and the English purchasers intend gradually to increase output to greatest possible capacity. The properties include many well known seams of coal and are estimated to contain at least 3,000,000,000 tons.
>
> The New River Co. represents an important unit in the plan, as a producer of over 1,000,000 tons per year and capacity of double this. It has outstanding $2,500,000 5% bonds, $6,737,400 6% preferred stock, $13,474,800 common, besides $600,000 of 6% notes. The company is in good position to trade because of the noteworthy improvement which has taken place in its affairs since the Boston interests ousted the Dixon management.

Electric Light versus Candle

The danger of using lights which are extinguished by gusts of wind from shots or by rapid currents of air used for ventilation or by falls of the user is illustrated by the following accident at Roundup, Mont.:

Gustave Delannoy, a coal miner, becoming confused in the darkness, after he had "spitted" a fuse preparatory to a blast in the Republic mine, wandered back into the room and practically on top of the charge a moment before it exploded. His body, fearfully mangled, was found several hours later. It is presumed that a gust of wind extinguished Delannoy's candle after he had lighted the fuse.

The Barroom Miners

By Berton Braley

Written especially for "Coal Age."

Says Dago Tony, "I tella you what,
I maka da bigga, da greata shot!
I getta da fifteen, da twenty ton,
Da boss he say, 'O you sonna-da-gun,
No other miner so good lak you'—
Datsa what he say, I tella you true!"
"G'wan," says Mike, as he gulps his beer,
"You quit yere tossin' the bull in here,
An' listen to ME—one day last spring,
I drills my holes an' I shoots 'em, bing!
An' seventeen cars was the coal I got,
Seventeen cars from a single shot."
Then the other fellows along the bar
Begins to talk of how good they are,
They boast of the wonderful shots they've made
And the strength and labor that they've displayed,
And the barkeep filled 'em up anew
As the night wore on and the stories grew,
And the tales grew long and the tales grew wide
And the more they boasted the more they lied,
Till one of the listeners goes outside;
He goes outside with a funny grin
And after a while he comes back in
With a pick and shovel and barrow too;
Well, the gang sings out as he heaves in view,
"Say, where did ye get them tools an' truck,
An' what are they here for, me laddie buck?"
"Simple enough," he says, says he,
"I've sat here harkin all night to ye,
With all the minin' ye've done in here,
An' I says to myself, I says, 'It's clear,
I gotta get busy, upon me soul,
An' shovel out some of this barroom coal.'
Ye've drilled an' shot it in grand old style,
So now I'll shovel it out awhile!"

Well, the gang looks sheepish when this is heard
An' they never utters a single word,
But drinks their beer an' wipes the foam
An' slips out quiet an' all goes home!

POWER DEPARTMENT

Machines for Continuous Current

By C. A. Tupper*

SYNOPSIS—Simple precautions to be observed in the installation and operation of this type of machines. This is the first of two articles upon this subject and deals exclusively with generators.

⁂

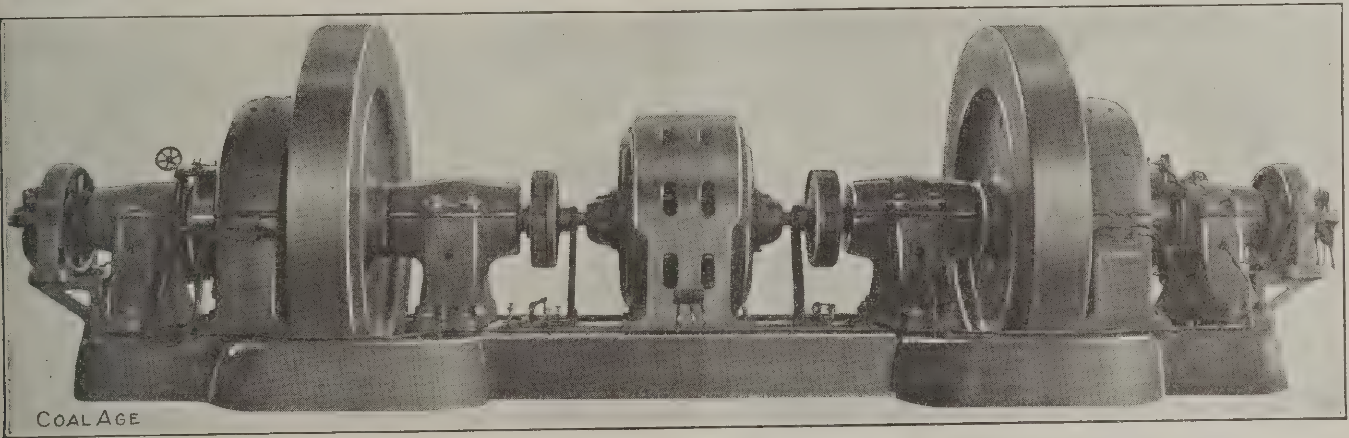
While the tendency to use alternating current for coal, coke and iron mining operations has narrowed the field of service for continuous- or "direct"-current machines, there are still many places in which these can be used to advantage, particularly for haulage or where variable speed is required, and the mine or mill superintendent who fails to give proper attention to aparatus of this class often finds himself in an awkward position. The following observations may, therefore, be of value from a practical operating standpoint.

The exact location of a generator is often arbitrarily fixed by that of apparatus already installed, but it is desirable to have the machine placed in a clean, dry and well ventilated power station away from combustible material, where plenty of light can be secured. The foundations should have enough body or mass to insure freedom from vibration. Provision should also be made for foundation bolts to hold sole plates or rails in position.

A good method of providing for these anchor bolts is to place each in a pipe at least 2 in. larger in diameter than the bolt and to arrange pockets in the foundation, so that access may be had to anchor-plate and bottom nuts. This will allow for adjustment. These bolts should be placed by templates made from blueprints of the machine furnished by the manufacturer.

If the machine has been exposed to a low temperature, it should not be unpacked in a warm room until it has had time to warm up to the temperature of the surrounding air, or it will "sweat." The machine will gather more or less dampness during shipment and it is advisable, before putting it in commission, to bake it out thoroughly. This can be accomplished either by external heat, or by heat produced in the windings themselves.

In the former case, the apparatus should be boxed in, and sufficient heat applied to raise the temperature to about 80 deg. C. (176 deg. F.). Where heat is to be produced in the windings themselves, in case of a compound machine, short circuit the armature through the series windings, placing a meter in the circuit, and gradually increase the speed until full load current is obtained. In case of a shunt machine, separate excitation of fields will be necessary, since the armature will not give sufficient electromotive force when short circuited, to excite the fields. If the machine cannot be operated at slow speed, resistance in addition to the regular rheostat will be required.



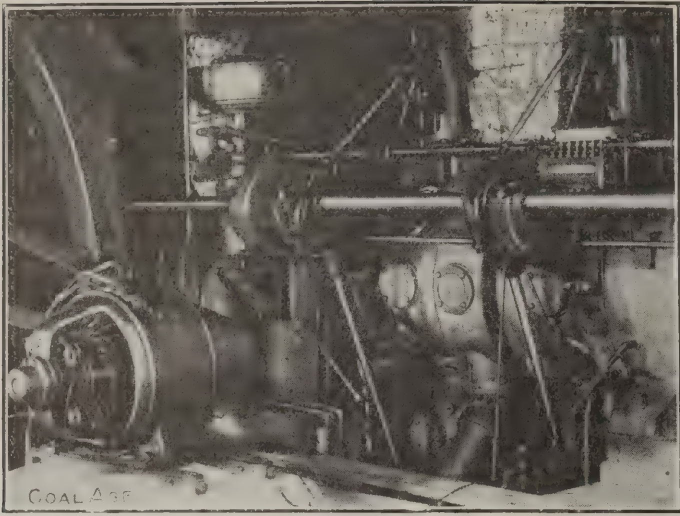
Continuous-Current Generators with Flywheels Driven by an Induction Motor

A shunt-wound generator should be run a short time at reduced speed without load, first having opened the field circuit. See that the oil in the gages is at proper level and that the rings are revolving and carrying oil. With all the field resistance in circuit, close the field switch. Gradually bring the machine up to speed and build up to normal voltage by cutting resistance out of the rheostat. Now note the operation of the machine and observe whether there is any tendency to force the armature out of its normal position. After getting the machine up to voltage and the brushes adjusted to their proper place, close the circuit breaker, then the main switch, and throw on the load. The voltage will drop as the load comes on, and the field will have to be adjusted to give proper voltage.

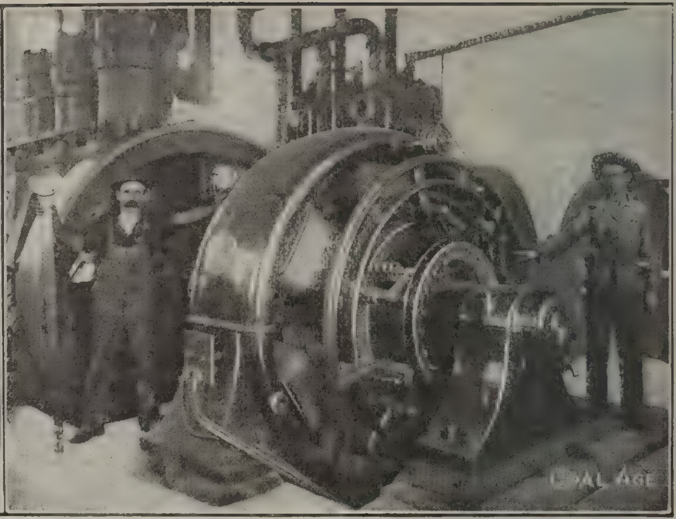
In case the generator does not build up to voltage when the field circuit is closed, as above explained, it will be found that either the machine has lost its residual magnetism, or that field coils are wrongly connected to the armature leads. In the former case, separately excite the fields from some other source of power for a few minutes. If, on reconnecting the fields, the generator does not build up, it is probable that the field coils are wrongly

---

*Cleveland, Ohio.



D.C. Generator Belted to Large Gas Engine



D.C. Generator Driven by Diesel Coal-Tar Engine

connected to the armature. In this case reverse the armature leads.

Precautions for Compound-Wound Machines

Take the same precautions in starting as stated for shunt-wound generators. When running at full speed and normal voltage, throw on the load, closing the circuit-breaker first, followed by the main switch. Note particularly whether the voltage drops to any great extent as the load increases; if so, the series coils are opposing the shunt and should be reversed.

Series shunts are usually provided with compound-wound machines, and these should be adjusted to give the exact compounding effect required, with the machine operating under normal conditions.

For parallel operation of the direct-current generators, assume that machine *A* is loaded and that machine *B* is to be placed in parallel. Bring machine *B* up to equal voltage; and, first noting that its polarity is the same as that of *A*, close the main switch. Then cut resistance out of the field of *B*, raising its voltage slightly and causing it to take more load. Since the voltage of a shunt machine varies with the load, it will be necessary to adjust the fields of both *A* and *B* to make them divide the load, and give proper terminal voltage.

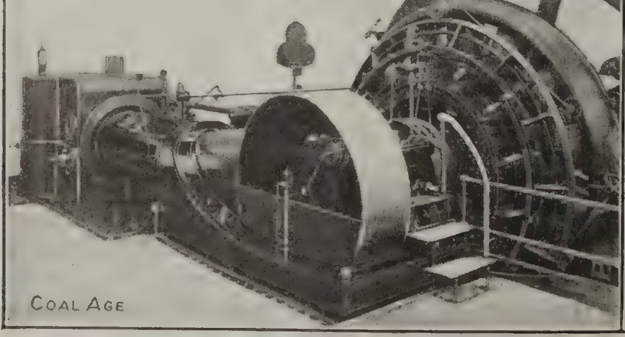
If the polarity of the machine, as connected with the switchboard, is opposite to that of busbars and it is desired to reverse this without changing cables, it can be accomplished by reversing the residual magnetism of the machine. When the residual magnetism is reversed, the machine will build up with opposite polarity. This may be accomplished as follows:

Remove all brushes from the holders and close the main switch for a few moments; then slowly open. By this means current will be forced through the fields from the busbars in a direction opposite from that when self-excited, and will reverse the residual magnetism. Again, this can be accomplished by removing the armature wire from the lower jaw of the main switch. The fields will then be excited in the same manner as above. This latter method is the more simple, and is to be recommended.

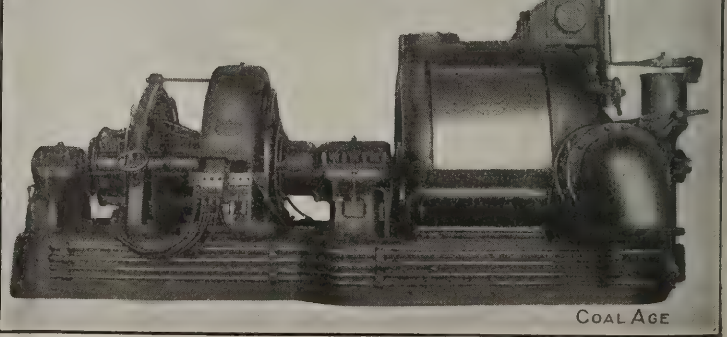
To take the load off machine *B*, gradually cut the resistance of the rheostat in circuit, thus shifting more load onto machine *A*. It will then be necessary to adjust the fields on machine *A* to bring the voltage back to normal. When the ammeter on machine *B* reads practically zero, trip its circuit-breaker and open the main switch. Cut all the resistance of the rheostat in circuit and shut down the generator.

Compound-Wound Machines in Parallel

The operation of compound-wound generators in parallel is slightly more complicated than that of shunt machines, since an additional connection between the machines is required. This connection is made at the beginning of the series winding; that is, where the armature cable is conected to the series coils, and is called



A D.C. Generator Coupled to a Corliss Engine



D.C. Generator Coupled to a Steam Turbine an equalizer main. In large central coal-mine power stations equalizer switches are placed near the machines on a special post, while in smaller plants a three-pole switch is provided on the switchboard. See that the equalizer mains are as short as possible, with plenty of cross-section, and never smaller than the armature mains.

As a first step toward operating two such machines in parallel, each should be operated under normal load, and its series shunt adjusted to give the compounding effect desired. If the machines are of the same size and make, they can be thrown together, and further slight adjustments made to their series shunts to make them properly divide the load. It might here be mentioned that the lead given the brushes somewhat changes the compounding effect of series windings. It is, therefore, necessary that the machines to be operated in parallel have their brushes set with approximately the same lead.

With machines of different size or make, it is necessary, in addition to the above, to obtain equal drop in voltage across the series winding and the cable connecting to the switchboard, when each machine is carrying its portion of the total load. In other words, the drop between equalizer main and busbar of the same polarity must be the same for each machine. If this is not the case, resistance must be added to the cable connecting the machine to its busbar.

In putting machine *B* in parallel with machine *A*, which is now loaded, bring *B* up to the same voltage and see that it has the same polarity as *A*. First close the equalizer switch, then the circuit breaker and finally the main switch. Gradually cut the resistance of rheostat *B* out of circuit, thus causing *B* to take more load. If the voltage is not at the proper point, adjust the fields of both *A* and *B* to obtain correct voltage.

If a single-pole circuit-breaker is used, see that it is placed in the main of opposite polarity from the equalizer side; that is, if the positive cable from the armature is connected to the series winding, then the circuit breaker must be placed in the negative main. The ammeter should be connected in the same lead as the circuit-breaker.

A necessary precedent to the successful starting and operation of direct-current generators is, of course, their careful installation; but the above has been given out of its proper order for the reason that, with these facts in mind, the following details will be better comprehended.

General Directions for Installing Machines

Few exact directions can be given for the erection of large direct-current generators, owing to the diversity of size and shape and the varying facilities for handling machines found at different coal mines or coking plants.

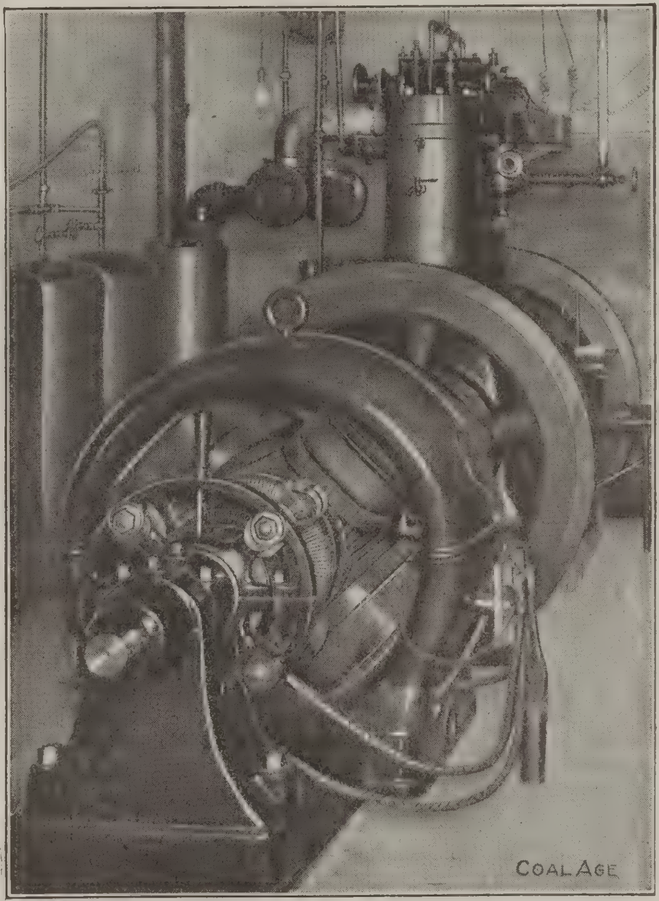
Most machines are shipped by the manufacturers with the field coils and poles assembled on the yoke. It is usual also, in order to facilitate shipping and handling, to have the yoke separated into two parts, and in the suggestions given below this will be assumed. The revolving armature, with its commutator, is always skidded separately, with suitable protection, and the other parts shipped as convenient.

A foundation having been prepared, as above indicated, and the machine received at the power house of the mine in complete condition for assembling, the following instructions apply to any standard make. Belted machines, adjustable on rails, will be first considered.

To start with, the rails should be temporarily placed and approximately leveled, then the base placed upon and bolted to them. Be extremely careful that the rails are wedged up, so that the weight of the base will be distributed evenly.

Then set the lower half of the field yoke in position, bolting it down and placing the dowel pins.

Next get the armature in position, being extremely careful not to scratch the bearing surfaces of the shaft, or in any way to bruise or injure commutator or windings. Handle the armature with a rope sling, protecting windings and commutator by a spreader. See that all oil wells and bearings are carefully cleaned, and all bearing surfaces covered with oil before placing the armature in its final position.



Continuous-Current Generator Connected to a Gas Engine

Set the top half of the field yoke in position, seeing that it is properly placed with relation to bottom half, and that all contact surfaces are clean.

Carefully level the machine and line up the driving pulley. If possible, turn the machine over in this condition with the belt not pulled up tight, and adjust while running, so that the belt runs to center of pulley and does not force the armature out of its central position, but leaves it free to oscillate in its bearings.

Tighten down the foundation bolts and grout in the rails. For this purpose a mixture of the following proportions may be used: One part portland cement with one part fine sand, mixed with sufficient water to obtain a thin consistency. Pour this under and around the rails, limiting the surface over which it spreads by a small clay dam. When the cement has partly set, remove all surplus and smooth up the joint under the rails.

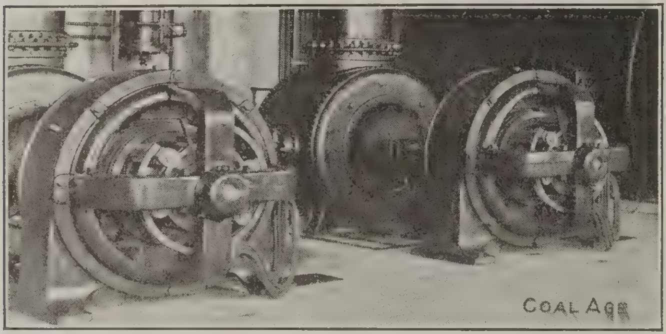
Setting Engine-Type Machines

Engine-type machines are, of course, not supplied with base or bearings, the engine shaft being extended to carry the armature, while the yoke is supported on the engine base, or on sole plates set on the engine foundations. Hence the following directions apply.

First set the sole plates temporarily in position, supporting them on iron wedges to allow for further adjustment.

Place the lower half of the yoke in position, inserting shims to a thickness of ¼ in., to allow for adjustment as the engine bearings wear down.

Locate the armature and the engine shaft in their bearings, observing the precautions in handling mentioned in connection with belted machines. In case the engine shaft has not been pressed into the armature spider, and it becomes necessary to do this work on the ground, an expert mechanic should be employed for the purpose.



D.C. Generators Direct Connected to Hydraulic Turbines

Place the top half of the yoke in position, cleaning all contact surfaces carefully. In aligning the yoke to the armature, see that the air gap is symmetrical at all points, and that the center of the laminated iron of the armature is in line with the center of the pole laminations. Failure to do this will put an undue strain on the shaft or give a side thrust. Leveling screws, when provided in the feet of the yoke, are a great help in aligning. Do not, however, leave the weight of the machine on any such screws, but insert shims. When the yoke has been bolted permanently in place, all leveling screws should stand free.

"Grout in" sole plates as previously explained. When the grout has set, tighten the foundation bolts and then carefully check over the alignment of the machine.

See that the series leads and clamping plates are carefully cleaned and securely bolted together, also that all contact surfaces of current-carrying members, such as armature-lead terminals, terminal plates, etc., are carefully cleaned and fitted together.

Concerning Brush-Holders and Rocker-Arms

Assemble the brush-holders on the rocker-arm and stagger them on one stud with respect to the holders on the next, in such a manner that the brushes will not follow the same path on the commutator. Set the brush-holders so that they clear the commutator, approximately ⅛ in. After the holders have been carefully set with the jig they should then be checked off to see if equal numbers of bars come between the different studs; if not, the distance from commutator to holders should be changed to obtain equal spacing of brushes. Holders should always be placed so that the commutator rotates against the brushes, tending to force them away from the holders.

The brushes should be carefully fitted to the commutator, first using coarse sand or garnet paper and finishing with fine sandpaper. While grinding in the brushes, hold the paper down on the commutator so as not to wear away the edge of the brush. Remove each brush from the holder and see that the entire surface of the brush is fitted to the commutator. Make sure that the finger presses squarely on the brush and does not have a tendency to push the brush out of line.

The finger should also give the proper amount of pressure on the brush; this can be easily adjusted by moving the tension spring on the holder. The proper amount of pressure can only be obtained by good judgment and careful attention to the special case in hand, as too little pressure will result in sparking, while too great pressure means excessive wear of the commutator and brushes.

See that the oil wells of the bearings are thoroughly cleaned and filled with a good grade of mineral oil to a level that will insure the rings carrying up the lubricant. Take care that oil-well covers are in place, so that dirt and foreign matter may be kept out of wells.

In all wiring at the power plant, as well as in a mine, special attention should be paid to the mechanical execution of the work. Careful and neat running, connecting, soldering and taping of conductors, securing and attaching of fittings are especially conducive to security and efficiency. Wire of an approved insulation must be used, and a cross-section sufficiently large for a liberal increase in load without injury to insulation should be provided.

COMING SOCIETY MEETINGS

The Coal Mining Institute of America will hold its winter meeting at the Fort Pitt Hotel, Pittsburgh, Penn., Dec. 4 and 5. C. L. Fay, Wilkes-Barre, Penn., is secretary.

West Virginia Coal Mining Institute will hold its winter meeting at Charleston, W. Va., on Dec. 8, 9 and 10. Neil Robinson, Charleston, W. Va., is president; E. N. Zern, Morgantown, W. Va., is secretary.

The Scranton District Mining Institute will hold its annual dinner in the Town Hall at Scranton on the evening of Nov. 29. It is reported that upward of 1200 banquet tickets have already been sold. J. H. Dague, of Scranton, is president.

An International Exposition on Safety and Sanitation will be held Dec. 11 to 20, at the Grand Central Palace, under the auspices of the American Museum of Safety. Dr. Tolman, of 29 West 39th St., New York City, is director general of the exposition.

The Rocky Mountain Coal-Mining Institute has decided to postpone indefinitely the November meeting which was booked for Denver. This decision is due to the serious strike situation which now exists in Colorado. F. W. Whiteside, Denver, Colo., is secretary.

Illinois Mining Institute will hold its next regular meeting in East St. Louis, Nov. 22, beginning at 9:30 a.m.; two sessions will be held, morning and afternoon. All who are interested in mining are invited. Applications for membership can be had by writing the Secretary-Treasurer, Martin Bolt, 1526 So. College St., Springfield, Ill. Headquarters will be at the Illmo Hotel. Meetings will be held in the City Hall.

EDITORIALS

What a close study of conditions is able to do in increasing the efficiency of the individual worker is shown by the numerous reports published from time to time, and which reveal a great advance in the matter of scientific management. An eastern machine shop increased its output 25 per cent., in a single department, and lowered the cost of labor from 10 to 20 per cent., while at the same time the wages were increased 25 per cent. This is an example of what an intelligent study of conditions can do to increase industrial efficiency.

⁂

Many coal operators are looking forward with apprehension to a possible war with Mexico. Even the Balkan wars caused a temporary exodus of laborers from various coal camps, and trouble such as would result from an invasion of Mexico would seriously hurt the coal industry, which at the present time is experiencing a shortage of labor in many fields. The coal mines of West Virginia, for instance, are badly in need of men, the operators there claiming that they could use from ten to fifteen thousand miners in jobs that will pay from $80 to $180 a month.

⁂

Removal of Tariff on Coal

The new tariff places coal and coke on the free list. Anthracite was already free from all protection. The change, therefore, affects only our bituminous product. We do not apprehend that disaster, in a commercial sense, will come to any of our coal-producing companies because of the removal of tariff.

We need never fear that European coal owners will successfully enter our local markets. The only competition of a serious nature is that from Nova Scotia and British Columbia in Canada. The Nova Scotia mines are producing about 7,000,000 tons annually. The coal is similar to that mined in northern West Virginia. It is largely consumed in eastern Canada, and now practically controls the market offered by the St. Lawrence ports. However, some of this coal finds its way into New England, and with all tariff removed, it is probable American consumers along our North Atlantic coast will use more of the Canadian fuel.

The output of the Nova Scotia field, however, is limited, the area of the entire district is not as large as any one of the important fields in our Eastern States. Practically all of the American coal that now seeks a market in New England is superior to Nova Scotia fuel, so that, so far as quality is concerned, the advantage lies with the American operator. It is, therefore, purely a question of transportation rates, with most of the advantage now favoring the Canadian producer, offset by the greater desirability of American coal for fuel purposes.

In Montana and Wyoming the situation is slightly more serious. Coal in the Crow's Nest field of British Columbia is not only equal, but is superior in many ways to our Montana and Wyoming lignites. The British Columbia field is quite extensive and can provide a considerably larger output if a market can be found. There is no doubt but that Canadian coal will prove a strong competitor in our Northwestern States. We feel confident, however, that American operators can produce at a cost as low, or lower, than their competitors across the line, and we predict that whatever change in the markets occurs will be only temporary and certainly not fatal.

Of course, it would be easy for the owners of American coal mines, in those districts where Canadian competition is a fact, to follow the usual procedure and predict financial ruin as a consequence of placing coal on the free list. But such a course has not been pursued, and our operators are preparing to retain their markets through an exercise of superior commercial and technical sagacity.

If free trade in coal and coke is beneficial to the United States as a whole, it is certain to be ultimately helpful to the fuel industries, even though it may be temporarily disconcerting. Any business that must needs exist at a sacrifice of the common good has been built on an insecure foundation. It would be well if each man engaged in any one of our great American industries ceased to believe that he alone should be handed a life preserver, while everyone else is obliged to swim ashore unaided.

⁂

Incorporating the Labor Trust

Secretary W. B. Wilson, speaking before the American Mining Congress, stated that he was opposed to the incorporation of labor unions. It was unreasonable, he said, to compel operators to run their mines by force of law when there was no profit obtainable or no market for their coal. That being the case, it would be wrong to incorporate the unions and make them liable for the abstention of men from work after an agreement had been signed.

But Mr. Wilson did not conceive that the *purpose* of a failure to comply with the agreement might, without injustice, receive juridical consideration. There is no crime committed when an operator decides to close his mines if his reason for his action is that the loss in operation is excessive and can no longer be sustained, or if individually he desires to sell his coal at a higher price and refuses to enter a sacrifice market, or if he can buy better coal elsewhere as cheaply or at less cost. He has always done this at his pleasure and nothing in the agreement abridges this right. But he has no warrant for shutting down his mines in order to compel the working man to accept any modification of the wage scale. He is bound by his agreement to pay the rates agreed whenever he operates his mine.

Similarly the working man has never been denied in America the right to hire himself to the highest bidder, to sell his labor where he will, to travel to other fields or to hunt a new job. These are his rights but when the men in a union stop work to make some coworker join the organization, or pay his dues, or wear the union button when the agreement clearly calls for an open shop, then we have the working man not seeking to maintain his right but endeavoring to violate an agreement to which he has signed his name directly or by proxy.

Of course, it is true that members of unions have repeatedly done this; the charge is not denied. We think it could have been *proved* to the satisfaction of the law courts, not once, but many times since the last anthracite agreement was signed. Suddenly 700 men apparently decide they cannot live on the wage paid them, for three or four days they all agree to hunt for other jobs in a town where no other jobs are obtainable and they do not move out to look for work elsewhere. At their meetings they declare the suspension is inaugurated to make certain men pay union dues. After a few days' idleness, those dues are paid and the men go back to work. Does any sane man, except perhaps a member of the President's cabinet, believe or pretend to believe that the 700 men quit work because they did not want to live on the wage agreement and so were looking for another job? Why, even a jury could not be made to believe that.

And if their purpose is to destroy the force of their signed agreement; then it is a pity they are not incorporated so that they can be sued. The working man should be as finical as his employer about making good his agreements and if he is not, the law should rectify his lack of moral responsibility. Occasionally, in some coal regions, the employer is disposed to break the agreement for his own personal advantage and it is a pity that, as the contract has merely a moral value, such an operator cannot be made financially responsible for such a violation of his plighted word.

⁂

The Firedamp Whistle

Word comes from Germany that a new "firedamp whistle" has just been invented by Privy-Councilor Haber and Dr. Oeiser, as a result of the appeal of the Emperor, made a year ago, that an attempt should be made to discover some means of preventing mine catastrophes due to the explosion of firedamp.

The device just exhibited to the Kaiser and which has met with his approval consists of a metallic cylinder 10 in. long and 2½ in. in diameter, operated by means of an air pump. The sound of the whistle is said to be audible 300 ft. away. When blown in pure air, the whistle gives an even tone; but when blown in air charged with marsh gas, the tone is said to vary from a shrill tremolo to a jerky staccato, depending on the percentage of gas present.

It seems strange that this device should be described as something new. It appears to be a resurrection of the old Forbes gas indicator, invented by Prof. Forbes more than half a century ago, but found to be of no practical application as a means of detecting gas in mines. The principle of the device depends on the difference in the length of the sound waves, in air of different densities. But, since the density of the mine air may vary as the result of a number of causes other than the presence of gas, no reliance can be placed on the indications for gas, as given by the tone of the whistle.

The Forbes indicator differed from the present device, in that a tuning fork of 512 vibrations per second was fixed in the mouth of a brass tube 6 in. long and 3 in. in diameter. The tube was fitted with a tightly fitting movable piston, the position of which was indicated by the movement of a pointer on a scale graduated to indicate percentages of gas present in the air. The zero of the scale corresponded to that position of the piston that produced a maximum resonance of the tuning fork in pure air. When testing for gas, the piston had to be moved until the tuning fork gave the same maximum resonance, which varied with the density of the air, for a like position of the piston. In this device a thermometer was attached to the instrument to make the necessary correction for the temperature of the air, as this would vary the density and the tone of the fork. The idea has long been abandoned as useless in its adaptation to mining conditions.

⁂

Passing of the Small Dealer

Compelling influences are slowly but surely revolutionizing the marketing of coal in the large consuming centers. The small independent unit, as in other lines of endeavor, is giving way to the large consolidation with its trained selling and technical experts, its unlimited tonnages and other accoutrements of enormous capital.

Marketing coal on a small scale is no longer an economically sound enterprise. Elaborate equipment involving costly machinery has effected such economies that dealers not equipped with modern facilities, find themselves at a serious disadvantage. Not only are they unable to effect an economical distribution of the product, but they are not prepared to meet the occasional heavy emergency demand.

The advent of the large hopper-bottom steel cars, or as they are commonly called, "battleships," may be taken as a typical example of the trend of conditions. The proportion of this kind of equipment is steadily increasing and it is only a question of a relatively short time when the "battleship" will have practically displaced the old-style gondola. The heavy additional expense of unloading these latter when the consignee had no trestles is too obvious to require comment.

In addition to this the net profit per ton is too small with the individual unit who handles but little to make the business lucrative. The large automobile truck with its capacity closely approaching that of the smaller railroad cars, is also becoming an important factor in the situation, while liability to loss due to bad debts or slow payment must be considered here, even more than in other lines of business.

⁂

Safety First?

It has been rather pertinently suggested that the time-worn adage "Safety First" be supplemented by one of "Discipline First." The idea is one that will probably commend itself to many coal engineers. While revolutionary in character, it offers a more tangible basis for procedure and there are many who will, no doubt, believe that it is an attack at the real root of the trouble.

Of the total fatalities, both inside and outside of the mines, it is well known that nearly half of these are due to falls of various kinds. Is it not a fact that one of the most rigid rules at all mines is that timbering must be kept up to the face so that every place will be safe? It is clear, therefore, that we have a single case (and one which is responsible for half of our total fatalities) in which the trouble is either directly or indirectly a violation of rules.

SOCIOLOGICAL DEPARTMENT

The Cabin Creek Y. M. C. A., Decota, W. Va.

(Special Correspondence)

The coal-mining town of Decota, W. Va., is situated at the junction of two small streams that form together Cabin Creek proper. The village is about 16 miles from Cabin Creek Junction, at which point the creek empties into the Kanawha River. The steep and high hills on either side of the narrow valley of the creek and its branches contain several seams of coal of workable thickness. About a dozen years ago, coal operators began to work these extensive beds of fuel. At one time upwards of 20 different companies were located along the creek. A few years ago 11 of these corporations combined to form the Cabin Creek Consolidated Coal Co., and four others combined under the sales agency of the Carbon Fuel Co. This combination as will be easily seen effects a great economy of administration and operation. Probably no operating coal companies in the country are better organized for conducting the business along modern lines than the Carbon Fuel Co., with J. R. Thomas as president and C. A. Cabell as general manager, and the Cabin Creek Consolidated Coal Co. with M. T. Davis as president and Ira F. Davis as general manager. Their accounting system is a marvel of simplicity and accuracy.

Capitalizing Crime

From their early history these companies took an active interest in the welfare of their employees. At one time there was a tract of 37 acres of land adjoining theirs which belonged to a private party but was of little value as it contained no coal and was unproductive for tillage. However, it was a great revenue producer for the owners as it contained a saloon which did a business far more profitable than any coal mine. It was a poor day indeed that it did not do a business of $300, and on one occasion at least it took in $2160 in a single day.

The companies felt that this saloon was a menace and a liability to the community, so they bought the property for the sum of $42,000, a price unheard of for similar land anywhere in the state. On gaining possession the saloon was closed, and although the new owners were offered the sum of $700 per month for the saloon privilege, it is to their credit that the offer was flatly refused.

The saloon was surrounded by a tight board fence 7 ft. high and on paydays the inclosure would be filled with the forms of miners in a state of helpless intoxication. On recovery, if they had any cash left the process would be repeated. Gambling and fighting were the order of the day for those who were sober enough to participate in such exciting amusements. Often it was three or four days after payday before there were a sufficient number of men able to work to run the mines at anything like a normal capacity.

But the closing of the saloon was only half the battle. The railway trains brought in large quantities of liquor. The great need for a substitute for the saloon became more and more apparent. Men in such communities have more or less leisure time on their hands as there are often days when on account of a car shortage or other reason the mines are idle. With men of small resources under such circumstances the most natural use of this time is in dissipation unless there is some healthful form of amusement provided.

The Old Saloon Now a Y. M. C. A. and on the Right, the Hall for Moving Pictures

Residence of the Decota Secretary of the Young Men's Christian Association

Saloon Turned into an Amusement Hall

It was the belief of some of the officials that the average miner does not go to the saloon for the sake of dissipation but for the social features. This belief became a conviction on further study. After a careful survey of the whole situation it was decided to fit up a club house in the old saloon building and have it operated under the auspices of the Young Men's Christian Association. Before anything was done, however, the whole matter was submitted to the men with the idea that unless they really desired to have such an enterprise in their midst, the company would not supply it.

They were not asked to assume any financial responsibility for its inception, but if it was to their liking on completion they could have its privileges by paying a nominal sum per month. This removed any taint of paternalism that so many similar enterprises labor under, for the men under the leadership of the secretary had the complete control of the whole affair, and spent the income for new apparatus and equipment so that in a short time they had a complete outfit from tennis courts to a swimming pool.

At the beginning the company fitted up the plant with a reading room, shower bath, game room, a casino for the sale of soft drinks, candy and tobacco, also a hall for moving pictures.

Employees Support and Supply Money to Extend the Work

The success was immediate and the place was patronized better than anyone had even hoped. As a surplus of revenue accumulated, two bowling alleys were installed, a piano was procured, also a phonograph and several good records. Later an electric bath cabinet was secured and finally a large outdoor swimming pool was installed, and many other recreative features were added. All this was made possible by the fact that the company was not seeking to get revenue from the enterprise, but were investing their cash in it each month, and it is significant that for every dollar that the company has put into the plant the men have put in an equal amount or more, not as a direct contribution, but as a reinvestment of the surplus income. This gives the men a sense of a proprietary interest in the scheme and develops a sense of mutuality that is invaluable in successful welfare work. The fact that during the recent labor troubles in that region, it was a common sight to see the miners and the "Baldwin Guards" in the pool together shows how popular the place was.

Tennis Courts

Swimming Pool

Dues Are 25c. a Month

Most of the men who live within a mile of the building are glad to pay the nominal sum of 25c. per month for the membership privileges. This fee entitles them to free baths, the reading room, game room and general social privileges as well as a reduced rate for use of the pool tables and bowling alleys. Twice a week a moving-picture show is given, and it is the aim of the secretary to give pictures having an educational value, avoiding the lurid, unreal wild-west type. This machine has also been a great help in giving illustrated lectures on health, safety methods, travel and other topics of interest to the men and women. The miners seem to be more easily reached through the eye than the other senses, and this makes the pictures a powerful moral and educational agent.

Formerly there was little interest in church work taken by these people. Here again the stereopticon came to the rescue. Lectures with colored slides on the Holy Land, Great Men of the Bible, Life of Christ, and other kindred topics were given. Care was taken to avoid sectarianism or denominationalism in these discourses, but to set forth the great fundamentals of right living as exemplified in the lives of great leaders. The appreciation of this effort was shown by the growth of the Sunday school. There were three schools in the neighborhood with a mere handful of attendants. In a few months the attendance had increased to upward of 60 or 80 pupils in each school. It was the universal testimony of all that there had been a general growth toward better things all along the creek.

Decline of the Leading Industry

A single item will indicate one of the great changes that took place in the first three years. The express-company business in transporting distilled liquors decreased from an average of 223 gal. per month to less than 50 gal. in a like period, and the amount of beer brought in decreased about 20 per cent. This, of course, meant much less drunkenness, and with it went a large portion of the gambling which always goes with excessive use of liquor. The few who still drank and gambled did it on the sly as it lost its popularity in the light of the new agency for healthful amusement.

The value of the association was shown in the great strike which all hope is now a thing of the past. While the association takes no sides in a controversy between employer and employee, it sustains a position of mutuality and serves all who come to use what it offers. Several of the mines were able to operate continuously, while all others in the neighborhood were closed. The spirit of a desire to settle differences was more manifest here by both miners and operators than in any other part of the strike zone. Much less time was lost here than in other parts of the field. Some well informed men went so far as to say that if the operators had begun this work five years ago in the entire field, the strike would not have occurred.

DISCUSSION BY READERS

Collapsible Stoppings

Letter No. 9—In reference to the building of light collapsible stoppings that will be destroyed by a local explosion of gas or dust and thus prevent a general mine explosion, it is well to remember that the bituminous mine law of Pennsylvania requires that all stoppings shall be built of noncombustible material. We may ask the question: Why? The answer is plain: Because we must have at least two headings leading to the coal face. The purpose is to provide a continuous intake and return airway for the circulation of the air current. The breakthroughs between these two entries must be made at a given distance apart and closed by air-tight stoppings, except the last breakthrough at the head of the entry, which is left open to allow of the passage of the air current.

Now, would not the building of entry stoppings in such a manner that they would be blown out easily, seriously interfere with the circulation of air and fail to carry out the idea expressed in the mine law in respect to stoppings? If the stoppings are to be built thus light and collapsible, why should not the doors, also, be built in the same manner? What would be the result? The mine water gage would drop, the air would short-circuit and the working face would be made dangerous for work. There would be more danger of an explosion occurring and less chance for the men engaged in the workings to escape.

My plan is to always build entry stoppings 20 in. thick, using one part cement, three parts sand and five parts mine rubble. I sometimes use a 9-in. common red-brick stopping. In a 70-ft. area, I sometimes build a pilaster in the center of the stopping to increase its strength.

ROBT. W. LIGHTBURN.

Adelaide, Penn.

⁂

Education and Training of Mining Men

I have been reading the letter of Mine Inspector John Rose, COAL AGE, Oct. 4, p. 509, relating to the practical training of miners by special instructors in the mines, as suggested by Inspector C. H. Nesbitt. I want to say again that, in my opinion, boys should be taken into the mines at an early age and taught how to do every kind of work, by going around with the men. They should know how to hang curtains or put up a brattice, lay tracks or drive a mule. They should be taught the use of the safety lamp and shown how to take it apart, clean it and put it together again, ready for use. The boy should learn this by observing the work being done. Then, when he is older he will be able to do the same work himself.

I differ with Mr. Rose, in his statement that many of the best practical men entered the mine after they were 21 years of age. I believe the results on record will not support this conclusion.

In regard to discipline in the mines, would say I have been bossing for the last 24 years, in different states, and never give a man an order that I do not expect him to obey. Mr. Rose states that many mine foremen who lack discipline, force and system, drift into the habit of telling miners to timber their working places and keep them safe, without expecting them to comply. Such a man is not fit to be a foreman. Of all men, the mine foreman must have discipline and require that his orders be carried out.

It is true that "upon the mine foreman devolves the responsibility for the coal output." A wise foreman, however, knows that he cannot put out the coal without men; and he will not endanger the lives of his miners for the sake of an extra car of coal. Knowing the danger of working under a loose top, a good foreman will compel the miner to set his timbers first, before loading the coal.

In closing, I want to say that the best mine foremen, in this country today, are the men who went into the mines when they were boys. We have many examples of this in the Scotch and English miners, now acting as mine foremen in our mines. Mr. Rose's suggestion that good common sense should be mixed with experience is true; but a man must know how to use both and enforce discipline. The miners soon come to understand the ways of a good foreman and will do what he orders. Such foremen draw a good class of miners around them and are respected by all.

SAMSON SMITH.

Mineral, Va.

⁂

The Liquor Problem

From what has been said of the relation of liquor to mining, in previous issues of COAL AGE, the general reader would receive the impression that coal miners are, as a class, harder drinkers than other workmen. The respectable coal miner naturally resents this impression. I believe there are as many hard drinkers among glass blowers, clay workers, lumbermen, salesmen and men of other callings as among miners.

The social standing of the drinker makes a great difference. The head of a corporation or other official is merely "indisposed," while the laborer is "on a drunk." The club man is taken home in his cab, while the coal miner, who is so unfortunate as to drink to excess, is left to his own chances.

Men are very much the creatures of circumstance. A man placed in an isolated mining camp, deprived of clean amusements and opportunities for self-betterment, such as libraries, churches, schools, etc., and thrown into contact with the ever-present gambler and subjected to the influence of the saloon atmosphere—in fact, separated from all refining influences is almost sure to become either a "rip" or an "angel." The environment of a man exerts a tremendous influence in shaping his life and character, and it makes little difference whether he is a coal miner or engaged in some other calling.

One superintendent has suggested that the driving out of 15 families from a mining community improved the conditions in that place. It must be remembered, however, that such an improvement is only local. Nothing has been done in their removal, to alter the life and surroundings of those 15 families who are driven from one mining camp to another; and the greatest sufferers, in such cases, are the wives and children of the men addicted to the drink habit. While it may be necessary to make an example of some cases, more attention should be given generally to reforming the drinker, by removing from him, as far as possible, the temptation and opportunity to drink and surrounding him with a different atmosphere that will give him greater encouragement to live better.

The problem must be fought from a broader standpoint. The question must be studied in its widest aspects. Efforts must be made to remove the evil and put in its place what will tend to the uplift and betterment of the community. Create a desire for self-improvement, study and recreation. Ascertain what is most needed to effect a transformation. Many drink because liquor is within their reach; therefore, remove the saloon and discourage the liquor traffic, in every way possible. It is well to remember that a man should not be blamed too strongly if he is overcome by conditions for which we are all responsible. I want to repeat that the liquor problem is not limited to coal mining but affects all industries alike.

Afterdamp

The principal gases resulting from mine fires are carbon monoxide, carbon dioxide and nitrogen. The relative quantities of these several gases will depend on the supply of fresh air to the fire. As the fresh-air supply is increased, the volume of carbon dioxide resulting will be greater, while that of carbon monoxide and nitrogen will be less; and *vice versa.*

The gases resulting from an explosion of firedamp are quite variable, depending on the composition of the firedamp mixture and the conditions affecting the circulation of air in the mine; also the condition of the mine workings with respect to dust and moisture. In a general way, the composition of afterdamp may be said to consist chiefly of carbon dioxide, carbon monoxide, nitrogen and water vapor, together with smaller amounts of nitrous oxide gas, unburned marsh gas and free hydrogen.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

What the Wet-and-Dry-Bulb Hygrometer Indicates—The wet-and-dry-bulb hygrometer shows the difference between the readings of the two thermometers. The dry-bulb thermometer, of course, indicates the actual temperature of the air. The reading of the wet-bulb thermometer is lowered by the evaporation of the water from the little sack surrounding this bulb, and which is kept moist by the water drawn up through the wick from the vessel below.

The difference of temperature indicated by these two thermometers depends on the rapidity of the evaporation of the water from the wet bulb. The evaporation is more rapid in dry than in wet air; and the difference of reading is, thus, an index or measure of the degree of saturation of the air. When the air is fully saturated with moisture there is no evaporation from the wet bulb and the readings of the two thermometers are the same. The difference increases with the dryness of the air.

Relative Humidity of Air—As previously explained the relative humidity of air is expressed by the ratio of the actual vapor pressure in the air at the time, to the saturated vapor pressure. The following table gives the percentage of saturation or the hygrometric state of air for various differences of readings, at different temperatures.

DIFFERENCE BETWEEN DRY AND WET BULB.

Reading of Dry Bulb Ther	1°	2°	3°	4°	5°	6°	7°	8°	9°	10°	11°	12°	13°	14°	15°	16°	17°	17.5	18°	18.5	19°	19.5	20°	20.5	21°

To use the table, find the observed temperature of the air, in the left-hand column, and the difference of the observed readings of the wet and dry-bulb thermometers, at the top of the table; the corresponding number in the table is the percentage of saturation which expresses the degree of humidity of the air. For example, if the dry-bulb temperature is 70 deg. and the wet bulb 64 deg. F. the difference of readings is 6 deg. and the corresponding humidity as taken from the above table is 72 per cent.

The Coal Age Pocket Book

Actual Vapor Pressure—The pressures given in the table below are the pressures the vapor exerts when the space it occupies is fully saturated; they are called the "saturated vapor pressures." When the weight of vapor in the air is not sufficient for saturation the vapor pressure will be eactly proportional to the degree of saturation. For example, if 50 per cent. of moisture is present or the air only half saturated, at, say 70° F., the "actual vapor pressure," as it is called, is one-half of the saturated vapor pressure of the table given later; or ½ × 0.3602 = 0.1801 lb. per sq.in.

To Calculate the Actual Vapor Pressure from the difference of the wet- and dry-bulb temperatures (t_d — t_w) and the barometric pressure (B), in inches of mercury, first find the saturated vapor pressure (P_w), in inches of mercury, corresponding to the wet-bulb temperature (t_w), from the table; and substitute this and the given values in the formula

$$\textit{Actual vapor pressure at temperature } t_d = P_w - \frac{B}{30}\left(\frac{t_d - t_w}{88}\right)$$

Example—Find the actual vapor pressure when the dry bulb reads 60° and the wet bulb 54° F., the barometric pressure being B = 30 in., and the saturated vapor pressure for the wet-bulb temperature (54° F.) being 0.4178 in. of mercury.

Solution—

$$p = 0.4178 - \frac{30}{30}\left(\frac{60 - 54}{88}\right) = 0.3497 \textit{ in. of mercury}$$

Since the saturated vapor pressure (see table) for the dry-bulb temperature (60° F.) is 0.5183 in., the relative humidity in the above example is

$$H = \frac{p}{P_d} \times 100 = \frac{0.3497 \times 100}{0.5183} = 67.4 \textit{ per cent.}$$

The Dew Point—What is called the "dew point," in hygrometry, is the temperature below which the moisture contained in the air begins to be deposited. For example, the weight of moisture, in grains per cubic foot, contained in the air, in the above example is (1 lb. = 7000 grs.)

$$w = 7000 \times 0.6235 \frac{0.674 \times 0.2545}{0.37\,(460 + 60)} = 3.9 \textit{ grs. per cu.ft.}$$

The temperature at which this weight of moisture will fully saturate a cubic foot of air is the dew point, because the slightest fall of temperature below that point will cause a deposition of moisture from the air.

The dew-point temperature is ascertained, in any given case, by first calculating the actual vapor pressure of the moisture in the air, as in the above example; and then, by referring to the table of saturated vapor pressures, find the temperature corresponding to that vapor pressure. This is true, because, as previously stated, the actual vapor pressure, at any given time, is equal to the saturated vapor pressure for the dew-point temperature. Thus, the actual vapor pressure for dry bulb 60° and wet bulb 54° was found to be 0.3497, which corresponds to a saturated vapor pressure or dew point of 49 deg.

INQUIRIES OF GENERAL INTEREST

Working Coal under Sandstone Cover

We are working a seam of lignite coal that varies from 6 to 12 ft. in thickness. The seam has an average pitch of about 3 per cent. A portion of the mine has reached the boundary line and the work of drawing back the pillars will soon be commenced. At the present time, the workings are largely standing on pillars.

Immediately overlying the coal is a sandstone that varies in thickness from 90 to 140 ft. The entire overburden varies from 100 to 400 ft. Underlying the coal is 12 in. of a hard fireclay that forms the floor of the seam. This is underlaid with 12 in. of a soft fireclay, beneath which is a hard rock varying from 1 to 2 ft. in thickness. The rooms are driven up the pitch and are 21 ft. wide with 30-ft. pillars between them, the rooms being driven on 51-ft. centers. The rooms are broken off the entry 10 ft. wide for a distance of 25 ft. and then widened out to the full width. Crosscuts are driven in the rooms every 70 ft. and are 10 ft. wide, leaving a pillar 60x30 ft. The rooms are usually driven 350 ft. in length, leaving a 60-ft. barrier pillar between the faces of the rooms and the air course of the next pair of entries.

Much difficulty has been experienced by the heaving of the bottom where the weight was too heavy on the pillars. The sandstone roof crumbles and falls from 6 to 10 ft. above the coal and, to avoid this trouble, there is generally left from 2 to 4 ft. of roof coal when driving up the room.

I would like to have the readers of Coal Age offer any suggestions in regard to the working of this seam, with particular reference to the breaking of the thick sandstone, so that the largest possible amount of coal can be realized in drawing back the pillars. Any information based on experience will be greatly appreciated.

W. N. Anderson.

Colorado Springs, Colo.

A Similar Inquiry from West Virginia

If you consider it of sufficient interest will you kindly ask the readers of Coal Age to discuss, from a practical standpoint, the best method of robbing a 7- to 8-ft. seam of coal, overlaid with a hard sandstone that is free from surface breaks. The seam is underlaid with a comparatively soft stratum that has a strong tendency to heave. The cover varies from 400 to 1000 ft. in thickness. The mine is worked on the panel system.

I would very much appreciate any practical suggestions in regard to the width of rooms and pillars, and the method to be employed for drawing back the pillars that will insure a maximum recovery of the coal, with the use of a minimum amount of timber.

West Virginia Engineer.

Stotesbury, W. Va.

[The foregoing inquiries, coming as they do at the same time, and asking for the discussion of practically like conditions in the mining of coal, show the great importance attaching to this subject. The two inquiries come from widely separated points and describe conditions that depend for successful working on practically the same essential feature, namely, the proper control of a strong roof pressure due to a hard sandstone rock and a heavy overburden.

We hope that these inquiries will bring forth a hearty response from men who have dealt successfully with similar conditions. Let there be a good discussion, accompanied by sufficient illustrations to make clear the methods suggested.—Ed.]

⁂

A Crossover Problem

At the request of a correspondent, we give below a diagram of a double crossover switch or "diamond," and shall be glad to have those interested in such problems send us their solutions to the same. We will publish the best, shortest and simplest of the solutions sent us and announce the name only, of the author of the second-best solution.

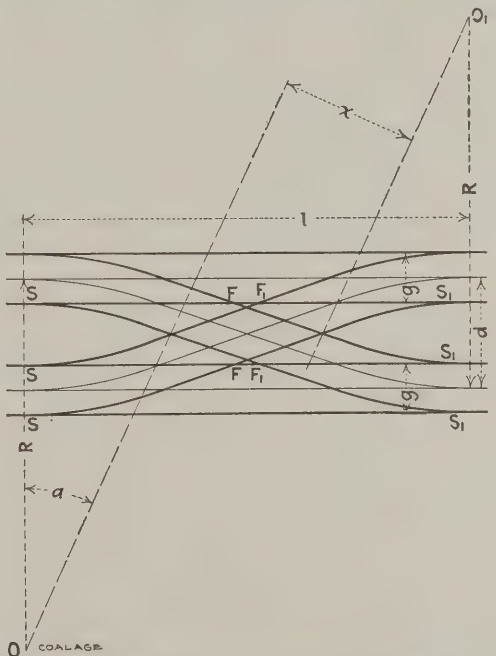

Diagram of a Diamond Or Double Crossover Switch

The problem is as follows: Given, the entire length (l) of crossover, from point of switch to point of switch; the distance (d) between track centers, the gage (g) of the tracks, and the radius (R) of the curves, all the curves having the same radius; it is required to find the frog distance $S\ F$ or $S_1\ F_1$; the length (x) of the straight rails at the center of each crossover; the length and radius of curve, for each rail in each switch; the length of lead rail and the frog angle.

The best solution of this problem will be published in our issue of Dec. 20. The second-best solution will be announced by name only. The problem is an interesting one in mine engineering.

The Government's Classification of Coal

The classification of coal into various grades such as bituminous, semi-bituminous, lignite, etc., is arbitrary and unsatisfactory. It is, however, in common use in the United States, and in the absence of anything better, it is published by the U. S. Geological Survey. The classes generally used in this country are as follows: Anthracite, semi-anthracite, semi-bituminous, bituminous, sub-bituminous and lignite.

Anthracite coal is generally well known, but in a systematic classification it is usually defined as a hard coal, having a fuel ratio (fixed carbon divided by volatile matter) of not less than 10. Most of this coal comes from the anthracite fields of eastern Pennsylvania, but small areas are known in some of the Western states where the coal has been changd to anthracite by the heat and pressure of masses of igneous rock.

Semi-anthracite coal has a fuel ratio ranging from 6 to 10. There is only a small amount of this coal in the United States, found in local basins or in close proximity to igneous rock. Semi-bituminous coal is of great commercial importance, but is not widely distributed. Its fuel ratio ranges from 3 to 6. It is the best steam coal in the country, and some of it can be utilized in the manufacture of coke. The centers of production are the Pocahontas and New River fields of Virginia and West Virginia, the Georges Creek field of Maryland, the Clearfield region of Pennsylvania, and the west end of the Arkansas field in the vicinity of Fort Smith. Although areas containing coal of this grade have been found in Washington and Colorado, the amount in these fields is small.

Bituminous coal is the most important grade in the country, and includes most of the deposits east of the Rocky Mountains. In the Western states there are large areas of bituminous coal such as the Trinidad-Raton field of Colorado and New Mexico, the Grand Hogback field of Colorado, the Book Cliffs field of Utah, the Rock Springs, Kemmerer and Black Hills fields of Wyoming, the Great Falls field of Montana and many districts in Washington. This grade furnishes most of the coking coal of the country, and is largely sold for steam raising and domestic use.

The term sub-bituminous has been adopted by the Geological Survey for what has generally been called black lignite. The latter term is objectionable for the reason that the coal is not lignitic in the sense of being woody, and the use of the term seems to imply that the fuel is little better than the brown woody lignite of North Dakota, whereas many of the coals of this class closely approach the lowest grade of bituminous.

It is extremely difficult to separate this class from the one below and the one above. It is generally distinguished from the lignite by its color and freedom from apparent woody texture, and from bituminous coal by the slacking which it undergoes when exposed to the weather, as the latter is an important difference in commercial use, it has been adopted by the Geological Survey as a criterion for the separation of sub-bituminous and bituminous coal.

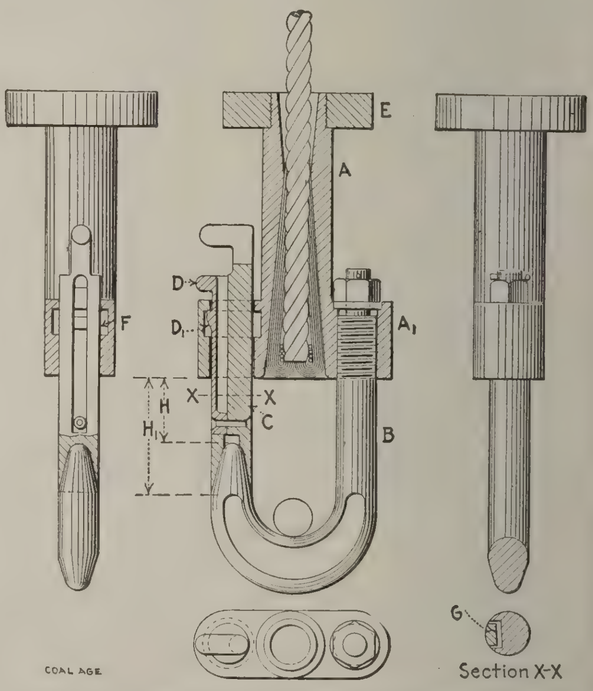
Sub-bituminous coal is found in most of the Western fields, being well known around Boulder and Denver and in northern parts of Colorado, Gallup, New Mexico, Hanna, Douglas, Sheridan and the Big Horn Basin of Wyoming, Red Lodge and Musselshell, Montana, and in many of the districts of Washington and Oregon.

As used by the Geological Survey the term lignite is restricted to the coals which are distinctly brown, and generally woody. They are intermediate in quality between peet and sub-bituminous coal. Lignite is abundant in the North, in eastern Montana and North Dakota and in the southwest corner of South Dakota. In the South it is present in all of the Gulf states, but has been developed commercially only in Texas.

⁂

Safety Hook for Sinking Buckets

A new safety hook for sinking buckets in connection with a cable clamp has been devised by an engineer at the Myslowitz colliery, in the North Kattowitz mining district of Germany and has been used there with good success. It is described in the "Zeitschrift für das Berg- Hütten- und Salinenwesen." It consists of the following principal parts: (1) The cable sleeve *A* with flange A_1 forged from the same piece; (2) the bucket hook *B*; (3) the lock bolt *C*; (4) the lock spring *D* welded on lug D_1; (5) the flange *E*.



Detail Construction of the Safety Hook

The cable clamp is bored out conically for receiving and fastening the rope. In the flange A_1 are held the bucket hook *B* and the lock bolt *C* which together form a closed shackle, the hook *B* being screwed into the flange A_1 and further secured with a keyed jam nut,, while the lock bolt *C* is loosely passed through its hole in the flange.

The lock bolt *C* is made of an iron bar cut or forged away at the upper part and is formed at the top as a handle for easy manipulation. At the lower end it is bored out conically to receive the point of the bucket hook. It is provided lengthwise with the groove *G* in which is set and riveted the lock spring *D*. The safety hook is closed in the illustrated position and, by the lock spring *D*, upon which the lug D_1 engaging in the cavity *F*, prevents self release of the lock bolt *C* and thus an

COAL AND COKE NEWS

Washington, D. C.

In view of the apparent delay with reference to the Keating resolution directing an investigation into the Colorado coal strike, Mr. Keating, on the 7th inst., made an attempt to get the resolution directly before the House of Representatives and secure action thereon, possibly by having it referred to a special committee. The resolution was introduced several days ago and referred to the House Committee on Rules, which has taken no action. Mr. Keating explained that the committee had no quorum, and he wanted his resolution referred to the Committee on Labor.

The motion precipitated a debate in which several members joined to discuss the merits of authorizing Congressional investigations into such matters when there exists a competent bureau in the administrative branch of the government for doing this work. Representative Page, of North Carolina, said that he believed that the Industrial Relations Commission which was authorized by the last Congress had the power to investigate the Colorado labor difficulties.

Representatives Mann and Mondell, of the Republican side, criticized the resolution, because it created a committee specially for the purpose of this one investigation. Mr. Mann said that the Bureau of Corporations in the Department of Commerce had the authority to investigate the matter, and Mr. Mondell said that the labor difficulties should be looked into by the Department of Labor.

Mr. Keating replied to the effect that the Department of Labor had considered the matter, but had found itself unable to proceed with an investigation. Mr. Mondell thereupon asserted that if the Democrats had voted for a sufficient appropriation for the department this handicap would not be apparent. No definite result has yet been arrived at in the matter.

Rates Must Not Be Increased

The St. Louis, Rocky Mountain & Southern and other railroads will not be permitted to increase the New Mexico coal rates according to a decision of the Interstate Commerce Commission announced on Nov. 4. The Rocky Mountain line attempted to cancel all through rates with the Rock Island road, thereby advancing the rates to Kansas City, St. Joseph, Omaha, Lincoln, Atchison, Wichita and other points.

It was discovered in this connection that the advance in rates was the result of the desire of the Rocky Mountain to receive greater divisions of the through rates. The commission ruled that differences between carriers over divisions in rates are not sufficient reason for advancing rates, and the roads were ordered to maintain in existence for two years from Nov. 1 the present rates.

The Red Ash Coal Co., of Ashley, Penn., has petitioned the commission for through rates and joint rates on anthracite coal from the collieries and washeries on the line of the Central Railroad of New Jersey to points on the Lehigh Valley west of Sayre to Buffalo, for transshipment by water and reshipment by rail to Suspension Bridge, for reshipment by rail, and to points west. The Lehigh Valley and other railroads were named defendants.

Senator Reed's amendment to the interstate commerce act proposing to make natural-gas pipe lines common carriers within the meaning of the law has been approved by the Senate without a recorded vote. The act now makes pipe lines transporting oil common carriers, whereas the amendment would add to that classification pipe lines transporting natural gas and submit such pipe lines to the regulation of the Interstate Commerce Commission.

The bill was adopted by the Senate on Nov. 3 with but little debate. Senator Reed took up most of the time given over to the discussion of the proposition in explaining its intent. The bill now goes to the House for its approval.

HARRISBURG, PENN.

An extra session of the legislature is being suggested as the only means of solving the question that now confronts the state since the defeat of the $50,000,000 road loan.

It seems that Governor Tener has no alternative but to call an extra session for the purpose of arriving at some definite understanding of the most important question confronting Pennsylvania at the present time.

Unless the second proposed amendment to the construction which was voted upon at the same time as the $50,000,000 road loan, is adopted, which will not be definitely known until the official count is made by the state department, such new acts as the "female labor law," etc., cannot be passed by the legislature, therefore it is contended that they are unconstitutional.

Article 3, Section 7 of the constitution provides that the general assembly shall not pass any local or special law regulating "labor, trade, mining, or manufacturing," until this section is repealed.

Labor unions were specially interested in this amendment, but in their effort to defeat the road loan, they have probably defeated the second amendment also. Following the cue of the state grange, the miners' union in the hard-coal region went on record against the loan. Their attitude was popular in the coal regions, and every hard-coal county, excepting possibly Luzerne voted down the road loan and their pet amendment with it.

Governor Tener within a few days will appoint the first state economy and efficiency commission, provided for by the last legislature to introduce modern methods in the various departments of the state government, and to see if the letter of the law creating the various departments is being lived up to.

Concerning the "Check-Off"

That the independent coal operators and the United Mine Workers may come closer together and that they will allow the "checkoff" is indicated by the attitude of the Clearview Coal Co., which operates a colliery at North Scranton, agreeing to allow the check-off. This is the first company to grant the check-off, but the union officials ultimately hope to have other independent operators grant their request, which in time they think will be followed by the big coal companies of the anthracite region.

Under the agreement made by the Clearview people, the dues will be deducted from the earnings of the men and will then be turned over to the properly authorized officer of the local union. On the part of the union it is agreed that there will be no strikes. All the men engaged in and around the colliery must be members of the union.

In granting the check-off it was stipulated and agreed that the men will have to sign off and deposit with the company authority to deduct their dues and waivers that will protect the company legally.

The plan is expected by both parties to the agreement to result in increased production for the company and in uninterrupted work for the men.

PENNSYLVANIA
Anthracite

Pittston—A fatal accident recently occurred in No. 9 colliery of the Pennsylvania Coal Co. when a premature blast instantly killed two men and seriously injured three others. Samuel Haddon, a prominent rock contractor and Thomas Williams were the men killed. They had prepared a blast, and shortly after dinner as is the usual custom the battery was applied. It failing to set the blast off, Haddon and Williams went to the face of the tunnel to learn the trouble, the switch on the battery being turned off. Just as they reached the blast the heavy charge exploded. The mine officials are at a loss to explain how the explosion occurred after the battery had been shut off.

Mahanoy City—Mahanoy Creek broke into the workings of the Draper colliery, flooding the mine and causing considerable damage. About 200,000 gal. an hour are being pumped from the mine, in spite of this the water has crept 35 ft. up the slope. The course of the creek is being changed

Nanticoke, Penn.—The Truesdale colliery of the Delaware, Lackawanna & Western R.R. Co. has produced more coal in the last year than any ordinary colliery in the anthracite field. A new record was set for the month of October, 105,020 tons being produced and shipped. Including retail sales the output for the month was 108,220 tons.

Two men were killed instantly and two others narrowly escaped death in the shaft of the Auchincloss colliery of the Lackawanna Coal Co. recently, when a concrete block weighing several hundred pounds fell part way down the shaft and crashed through the cage on which they were standing. The men were engaged in repairing a beam in the shaft, below the surface level, and the concrete was part of the water line used to carry away drippings from the side walls and prevent their trickling to the bottom, it became loosened within a few minutes from the time it was inspected as the men went down the shaft.

Bituminous

Indiana—The Manor Real Estate & Trust Co. recently obtained the holdings of the Greenwich Coal & Coke Co., a tract of something more than 27,000 acres in Greene and Buffington Townships paying approximately $4,000,000. It is expected that the Cherrytree & Dixonville R.R. will be extended to the new coal field and will be the coal carrier.

New Castle—Attorney B. H. Akens recently delivered a deed to John K. Bell, of Pittsburgh, for 800 acres of coal land in Washington County, formerly owned by the Washington County Coal Co., now bankrupt. The purchase price was $165,0000.

Washington—An injunction was recently granted by the court upon the petition of the Reliance Coal Co., of Centerville, against five miners. This litigation has grown out of the trouble at the Reliance Coal Co. property over the determination of the company to operate nonunion. The defendants are restrained from interfering with the employees of the said company or its property.

Independence—Two farms at this place have been sold in the last few days. Both are large farms, the Dodds containing 202 acres and the Brown farm upward of 250 acres. The coal under the Brown farm was sold sometime ago to the Meadow Lands Coal Co. The Dodds farm contains a good tract of timber largely locust. The coal was reserved.

WEST VIRGINIA

Wellsburg—The strike situation at the La Belle and Gilchrist mines near here remains about unchanged. No attempt has been made to bring in strike breakers. The strikers demand a working day of eight hours, a check weighman and recognition of the union. The operators are willing to concede the first two propositions, but refuse to recognize the miners' organization.

Charleston—In order to keep in closer touch with the accidents that occur in and around the mines of the state, the Department of Mines has sent out circular letters asking the coal operators in the state in making their reports of accidents to the mine inspectors to make duplicate copies, sending one directly to the office of the Department of Mines, and another to the inspector as heretofore. The Department of Mines is called upon almost daily for information concerning accidents, and in the future it is desired to be able to give this information promptly.

Bluefield—A new company styling itself the Sandy Ridge Coal & Coke Co. was recently organized here. This firm proposes to develop about 175 acres in Russel County, Va., which carries five commercial beds of coal above water level. This property lies on a branch of the Norfolk & Western R.R.

TENNESSEE

Chattanooga—It is reported that financial backing has been assured for the Cumberland Colliery Co., which will shortly erect near Chattanooga coke ovens and a byproduct plant representing an investment of $1,500,000. It is understood that the plant will be located either in Lookout Valley or upon Moccasin Bend.

KENTUCKY

Louisville—The Wilhoit Coal Co., which has been operating mines in the Harlan district of eastern Kentucky, has been adjudged bankrupt in the District Court of Louisville on the petition of three creditors, the Standard Oil Co., the Swann-Abram Hat Co. and the Keuffel & Esser Co. It is understood that Roy Wilhoit, president of the company, has a personal claim covering most of the company's property. Mr. Wilhoit stated after the adjudication that the status of the company will in no way affect his other interests, one of the principal of which is the Cumberland Coal Corporation, which controls a large acreage of valuable coal land in the Harlan field.

Middlesboro—The recently announced purchase by the Kentucky Utilities Co., of the Asher electric power plant, which has been operated by the Southern Mining Co., has excited much interest among operators in that section, who appreciate the possibility of using electricity for all power requirements in their mines at an early date. It has been announced from the company's offices at Lexington that it will extend lines into the territory west and south of Middlesboro, as far as the Clear Fork district, for the benefit of coal operations; and it has been reported also that an electric interurban line will ultimately be established by the company, terminating at Jellico on the south and Middlesboro on the north. At the present time, the mines of the Bell and Bath County field will be served.

OHIO

Columbus—The Ohio Mining Commission took up the greater part of the week ending Nov. 8 with hearing arguments from the miners' side of the question, of the method to be used in paying for coal mined in the state. John Moore, William Green and others, of the United Mine Workers of America, appeared before the commission to argue the justice of paying on the mine-run basis. The week begining Nov. 10 will be given over to hearing arguments from the operators.

Martins Ferry—Ground has been broken by the Morgan Coal Co., of Bellaire, for a new mine located between Bannock and Fairpoint, Ohio. Arthur Morgan, of the Edgehill Mine, of Bellaire, is the owner of the new operation, which is located on the C. L. & W. division of the B. & O.

Congo—Mine No. 301 of the Sunday Creek Co. was set on fire recently by a short-circuit in the electrical equipment. The mine is connected with Mine No. 302 across the creek and steps were taken at once to seal up the mine to prevent the fire from spreading to No. 302. This has been accomplished. Mine No. 301 will remain sealed up until it burns itself out. The extent of the damage cannot be ascertained.

INDIANA

Petersburg—The Bicknell Coal Co., Bicknell, Ind., has leased 1100 acres of coal lands lying east of the city and will take options on several hundred adjoining acres. The shaft is to be completed within a year and the coal to be taken up within five years. The price paid for the coal is $35 an acre, with extra compensation for ground for tipple and yards.

Jeffersonville—More than half of the advance tows, with coal from Pittsburgh, were delayed by falling water in the Ohio and are tied up between this city and Cincinnati. Most of the coal that got through to this point went on to Memphis and New Orleans.

ILLINOIS

Worden—A suit for $8000 has been filed by P. K. Fornash against the Kerens-Donnewald Coal Co. It is alleged that the mine ventilation was poor and the air made the complainant ill so that he has been unable to work for several months.

Edwardsville—Before a board of arbitration here, working under the Illinois Workmen's Compensation Act, James Fry, of Worden, was awarded $3500 from the Kerens-Donnewald Coal Co. Fry was injured Nov. 22, 1912, when a prop in the mine struck him on the head. The wound appeared slight at first, but a month later he was stricken with paralysis and it was then discovered his skull had been fractured. He asked for a settlement under the Compensation Act.

Marion—Complete practical arrangements have been made for the connection at Du Quoin with the Southern Traction Co. of the Electric Traction Lines, extending westward from Harrisburg in Saline County from the coal fields east of here and continuing on to Johnson City and across Franklin County to Du Quoin. This will give the coal-producing counties of Saline, Williamson and Franklin an electrically operated outlet into St. Louis.

O'Fallon—Illinois coal-hoisting records are believed to have been broken on Nov. 7, when the Nigger Hollow Mine No. 2 hoisted 4400 tons of coal in 7¼ hours. The previous record was held by a mine at Benld, Ill., which hoistel 4356 tons in 8 hours.

FOREIGN NEWS

Statistics for 1912 as to coal consumption are beginning to be made public by Latin American governments. Argentina imported 3,707,956 tons of coal, practically all of which came from the United Kingdom. Small shipments only were received from the United States. Mexico, which supplies a considerable part of its needs from its own mines, imported 290,264 tons from the United States, 47,165 tons from Canada and 38,370 tons from the United Kingdom. On the other hand Mexico exported 50,770 tons to the United States. This movement was entirely to Texas points in the immediate vicinity of some of the Mexican mines. Of the total imports of Porto Rico, the United States secured 42,986 tons. British shipments totaled 4327 tons. Of the imports for the Dominican Republic, the United States furnished 8635 tons, as compared with 1674 tons from Great Britain and 1407 tons from other countries.

Tegucigalpa, Honduras—A concession has been given to American interests for the exploitation of coal in the departments of Yoro, Atlantida and Colon. The concessionaire is allowed free importation of tools and machinery and material to carry on the work. Ten per cent. of the gross coal mined goes to the government in return for the concession.

Vancouver Island, B. C.—There is little change in the position at the mines of the Canadian Collieries (Dunsmuir), Ltd. The production at the company's Cumberland mines, for the month of October was 51,296 tons as compared with 52,187 tons in September. At the company's Extension colliery production continues between 200 and 300 tons a day, haulage facilities for a larger quantity still being unavailable.

The Pacific Coast Coal Mines, Ltd., operating at South Wellington, is arranging to increase its output from 200 to 300 tons a day. All coal being produced comes from No. 2 mine. Conditions in No. 1 mine since the miners stopped work six months ago became unfavorable for production, but a dozen men have lately been employed in putting the mine in shape to allow of an early resumption of coal mining.

PUBLICATIONS RECEIVED

Proceedings Mine Inspectors' Institute of U. S. A. Ninety-six pages, 6x9 in.; unillustrated. Copies have been sent to all mine inspectors in the United States and Canada. Inspectors not receiving a copy should write J. T. Beard, editor-in-chief of the Institute, 505 Pearl St., New York.

RECENT COAL AND COKE PATENTS

Gas Producer. J. A. Herrick, New York, N. Y. 1,075,566. Oct. 14, 1913. Filed July 10, 1911. Serial No. 637,615.

Heating Furnace—A. Glass, Wheeling, W. Va. 1,074,258. Sept. 30, 1913. Filed Feb. 8, 1912. Serial No. 676,466.

Feeding Device for Furnaces. J. Harrington, Riverside, Ill. 1,075,352. Oct. 14, 1913. Filed Mar. 7, 1912. Serial No. 682,139.

Steam Superheater. C. S. Hooper and R. C. Stevens, Erie, Penn. 1,074,792. Oct. 7, 1913. Filed May 11, 1912. Serial No. 696,574.

Steam Superheater. P. Thomsen, Cassel Wilhelmshoke. Germany. 1,074,300. Sept. 30, 1913. Filed Oct. 29, 1912. Serial No. 728,371.

Underfeed Stoker. W. C. A. Henry, assignor to the B. T. U. Co., Pittsburgh, Penn. 1,074,118. Sept. 30, 1913. Filed Apr. 15, 1912. Serial No. 690,762.

Soft-Coal Burner. P. P. Cooley, assignor to Culter & Proctor Stove Co., Peoria, Ill. 1,075,335. Oct. 14, 1913. Filed Nov. 18, 1910. Serial No. 593,066.

Mine Car Wheel—H. A. Holzer, assignor to United Iron Works Co., Springfield, Mo. 1,074,363. Sept. 30, 1913. Filed July 16, 1912. Serial No. 709,646

Fuel Economizer. E. B. Freeman, Dedham, Mass., assignor to B. F. Sturtevant Co., Boston, Mass. 1,074,855. Oct. 7, 1913. Filed Nov. 25, 1908. Serial No. 464,464.

Coal-Leveling Machine for Bee-Hive Ovens. J. H. Huhn, assignor to Covington Machine Co., a corporation of Virginia. 1,074,119. Sept. 30, 1913. Filed Feb. 6, 1911. Serial No. 606,827.

PERSONALS

R. T. Stewart, for some time mine manager for the Corbin Coal and Coke Co. in southeast Kootenay, British Columbia, has left that province for Brazeau, Alberta.

E. J. Quealy has returned to his home at Kemmerer, Wyo., accompanied by M. S. Kemmerer, of Mauch Chunk, Penn., who is interested in Mr. Quealy's Wyoming operations.

C. C. Johnston, who has been editor and manager of the "Coal Mining Review and Industrial Index," of Columbus, Ohio, for seven years, has severed his connection with the paper.

Nick J. Boylan, connected with the Pittsburgh Coal Co., for 12 years, has entered the employ of Pickands, Mather & Co., in their coal department. Mr. Boylan is one of the best known coal men on the lakes.

President T. H. Watkins, of the Pennsylvania Coal & Coke Corporation sailed for England this week accompanied by his son, C. L. Watkins, president of the Watkins Coal Co. They expect to be gone about a month.

Heinrich J. Freyn, formerly consulting engineer of the gas-engine department of the Allis-Chalmers Manufacturing Co., of Milwaukee, has recently joined the H. Koppers Co., of Chicago, in the capacity of third vice-president.

George Watkins Evans, consulting coal-mining engineer, of Seattle, has completed the examination of the Matanuska coal field of Alaska for the United States Navy. Mr. Evans will soon resume his private practice in Seattle.

Kingdon Gould, president of the Consolidated Coal Co. of St. Louis, and interested in the other Gould coal properties, has just finished a trip of inspection of the Gould mines in the states of Arkansas, Oklahoma, Kansas, Missouri and Illinois.

W. R. Riggleman has been appointed district mine inspector of District No. 1 of West Virginia, succeeding Carl F. Schoew, resigned. Mr. Riggleman has been connected with the Davis Coal Co. at Thomas as mine foreman, and is a well known coal man.

N. M. Rice, on Nov. 15, becomes purchasing agent of all the Frisco Lines, with headquarters in St. Louis. Mr. Rice will assume the duties of the fuel agent in the purchase of all fuels. He comes to the Frisco from the Santa Fé, where he was store keeper.

Robert V. Rex, Superintendent, of Continental No. 2, of the H. C. Frick Coke Co., has been appointed superintendent at Leisenring No. 3 to succeed A. R. Miller who resigned. Mr. Rex will be succeeded at Continental No. 2 by Samuel Brown, of the Standard plant of the H. C. Frick Coke Co.

Amos Godfrey, who has had charge of the British Columbia Anthracite Co.'s field operations in the Groundhog coal basin, in the northern part of Skeena district, has returned to Vancouver, B. C. Two seams of good coal, one of 7 ft. and the other of 4 ft. 6 in., are stated to have been opened by last season's prospecting work.

D. B. Dowling, of the Geological Survey of Canada, who has done much geological field work in the eastern part of the Rocky Mountains in Alberta, especially in connection with the extensive coal measures, recently left Ottawa for the vicinity of Okotoks, some 30 miles south of Calgary, where it was lately reported oil had been found.

Ben W. Robinson, who recently resigned as general manager of the Victoria Coal Co., at Earlington, Ky., has removed to Equality, Ill. He becomes president and general manager of a company which has been organized to open and equip a new operation in that field. A new mine, which will tap a hitherto untouched body of coal, is to be opened.

John Mitchell, former president of the United Mine Workers of America, will resign his office with the American Federation of Labor, with which he has been connected for 15 years. Mr. Mitchell made this announcement at a banquet in his honor at Butte, Mont. He said that his withdrawal was voluntary and would be formally made at the meeting of the Federation in Seattle.

Oscar W. Schell, division superintendent for the Delaware & Hudson Co., since the death of E. R. Peckens, whom he succeeded eleven years ago, has tendered his resignation to the company. The company tried to have him reconsider his determination to quit, but he refused as he has something better in view. Charles Considine, an outside foreman at Providence, near Scranton, has been appointed to succeed Mr. Schell.

OBITUARY

Joseph J. Jones, district superintendent of the Lehigh Valley Coal Co., died recently at his home, 388 North River St., Wilkes-Barre, Penn., following a weeks illness. He was aged 63 years, and was one of the mining experts of the Wyoming Valley. Mr. Jones had been foreman at the Dorrance, Prospect, Parsons, Midvale and Oakwood collieries for more than thirty years.

CONSTRUCTION NEWS

Forksville, Penn.—A coal breaker having a capacity of 400 tons daily is being constructed at this place.

Poland, Penn.—A contract has just been awarded A. K. Jenkins & Co. for the erection of a large coal tipple and bin for the Poland Coal Co.

Houston, Tex.—The Southwestern Steel Development Co. has consummated arrangements insuring the construction of an extensive plant to include iron furnaces, steel mills, coke ovens, etc., at Texas City.

Roanoke, Va.—Orders have just been placed for the materials necessary for the construction of 1000 all steel hopper cars at the Roanoke shops of the Norfolk & Western, and work will be begun as soon as other orders that precede this have been completed.

Sturgis, Ky.—Allen & Garcia, of Chicago, are installing at the West Kentucky Coal Co.'s mine No. 9, the largest shaker screens in western Kentucky. The screens have a greater capacity than any which have been set up in that part of the state. Work will shortly be completed on the screens and the other equipment being installed at the mine, and shipments will begin at an early date.

Philadelphia, Penn.—Coal exports from this port during the month of October were exceptionally heavy. They totaled 104,591 tons of bituminous coal and 5891 tons of anthracite. In October 1912, there were shipped from here 78,512 tons of bituminous and 7666 tons of anthracite. Last month's gain was 25,019 tons in the bituminous trade and a loss of 1775 tons of anthracite. In September the shipments aggregated 82,963 tons of bituminous and 6148 tons of hard coal.

Uniontown, Penn.—A new coal concern to be known as the Strange Creek Coal and Coke Co., is being formed to operate 4000 acres of Strange Creek, West Virginia coal, owned principally by Fayette County people. The officers of the company are all Uniontown men. A committee of seven was appointed to secure a charter from the state of West Virginia and proceed immediately to complete the incorporation. The coal land comprising this tract has railroad frontage on the Mead and Spear R.R., also the Coal and Coke R.R., while the Baltimore & Ohio has a branch within two miles of the property.

Cairnbrook, Penn.—The Pennsylvania R.R. spur to Cairnbrook, the coal town of the Loyalhanna Coal and Coke Co., has been completed, and the work of loading several thousand tons of coal that was stored while the headings were being driven is progressing rapidly. The spur to the Cairnbrook mines is being extended to the Dark Shade Creek to a new opening that is being made about a half mile away by the Wilmore Coal Co. From the new Berwind-White holdings the spur leads to holdings of the Logan Coal Co., where a new opening is being made. The "B" and "C" seams in all of these operations are being worked. The Berwind-White and Consolidation Coal Co. own lands on different sides of the Shade Creek, near Central City, and as a result of operations that are contemplated there much interest has been manifest in real estate circles recently.

NEW INCORPORATIONS

Clarksburg, W. Va.—The Templeton Coal Co. has been incorporated with a capital stock of $25,000, to develop coal mines.

Gadsden, Ala.—The Little River Mining Co. has been incorporated with a capital stock of $4000, to develop coal mines near Gadsden.

Wilburton, Okla.—The Howard Bros. Coal & Mining Co. has been organized with a capital stock of $1000. The incorporators are: John, William and Richard Howard, of Wiburton.

Oklahoma City, Okla.—The Carson Mining Co. has been organized with a capital stock of $25,000. The incorporators are: John Hart, L. M. Owen, and D. F. Peyton, of Oklahoma City.

Cleveland, Ohio—The National Peat Co., of Cleveland, Ohio, was recently granted a charter under the laws of Delaware, with a capital stock of $500,000. Robert O. Bartolomew, of Cleveland, was chief incorporator.

Nelsonville, Ohio—The Clifton Coal Co., of Nelsonville, Ohio, has been incorporated with a capital stock of $10,000, to mine and deal in coal. The incorporators are George W. McKee, Wilbur McKee, A. B. Ailes, Julius Fisher and George W. Lowery.

Sutton, Ky.—The Funk Coal Co. has been organized for the purpose of mining coal. The capital stock is $25,000, and the incorporators are: H. H. Funk, Belle Musick, of Toler, Ky.; A. J. Younce, of Sutton; Thomas West and J. R. Barbour, of Williamson, W. Va.

Columbus, Ohio—The Northern Mining & Fuel Co., of Columbus, Ohio, has been incorporated with a capital stock of $10,000, to mine and deal in coal. The incorporators are H. B. Halliday, A. T. Seymour, Lowry F. Sater, C. E. Richards and E. T. Bunker.

Camden, N. J.—The Coisa Portland Cement Co. has been organized with a capital of $160,000. The objects of the incorporation are to mine, quarry and sell limestone, shale, coal and all kinds of minerals. The incorporators are John D. Stevenson, 3d, William J. Montgomery, and H. B. Martin.

INDUSTRIAL NOTES

Martins Ferry, Ohio—The Beech Flat Coal Co. has recently installed a large steam shovel for stripping the overburden from its coal.

Uniontown, Penn.—The Mt. Hope Coal Co., of Uniontown, has sold its plant and holdings, consisting of 185 acres of coal and 150 coke ovens at Lynn Station, to the People's Coal Co., of Pittsburgh.

Columbus, Ohio—Suit has been filed by the Gibson-Spence Coal Co., of Columbus, Ohio, against the Clarion Coal Co. for a receiver. The Gibson-Spence Co. claims to be holder of two notes amounting to $1177.

Wellsburg, W. Va.—The Bowman coal property was recently sold by the Wellsburg, Bethany & Washington R.R. Co. to Guido Bros. The mine is a new one and is located at the foot of Buchannan's Hill on Bethany Pike.

Pomeroy, Ohio—The Dixie Salt Works and coal properties at Mason, W. Va., was sold at receiver's sale at Pomeroy recently by Referee E. R. Titus to George Schlaegel, for $30,650, Mr. Schlaegel represents the Pomeroy Products Co., which was formed for taking over the Dixie properties.

Washington, D. C.—The coal exportation of continental United States for 1913 will probably approximate $100,000,000 in value according to figures of the Bureau of Foreign & Domestic Commerce. This puts the United States in the third place among the coal exporting countries of the world, being exceeded only by the United Kingdom and Germany.

Columbus, Ohio—The Kanawha & Michigan Ry.'s joint ownership by the Lake Shore and Chesapeake & Ohio must cease, according to a decision handed down, Nov. 11, in the United States Circuit Court. The opinion was in the suit of the Government against the companies for alleged monopoly of coal carrying facilities from the Hocking coal regions.

Columbus, Ohio—The Ohio Utilities Commission is watching with zealous eyes the recent advances in the price of coal in Ohio with a view to bringing proceedings against the operators in case it can be proven that there is a coal monopoly in the Buckeye State. To that end investigators have been sent out by the commission to ascertain the facts in the matter.

Operators in Ohio are not in the least freightened over the prospects of prosecution as they claim there is no semblance of a combination among the various operators of the state. They say the price of coal depends absolutely on the car supply and the demand for all grades and is not an arbitrary matter.

Another thing being investigated by the commission is charges of favoritism in the distribution of cars. It is claimed by some operators that more cars are furnished for interstate traffic than for traffic within the boundaries of Ohio.

Pittsburgh, Penn.—In approximately 100 years since coal mining began in the United States the country has produced 9,275,000,000 tons, of which Pennsylvania has mined 4,913,000,000 or 53%. No other one state has mined as much as 1,000,000,000 tons, Illinois being the nearest with 903,900,000 tons. Furthermore, the production of Pennsylvania for the last four years which stands at 935,500,000 exceeds the total production of Illinois since coal mining began in that state in 1833.

COAL TRADE REVIEWS

GENERAL REVIEW

Fall in temperature causes a rush for hard coal; trade active and few concessions to be had. Bituminous weak in spots, particularly in Coastwise business. Consumers showing a lack of interest and some price cutting is noted. Operators making a determined effort to hold the market. Effects of the heavy weather in the Central States.

An unexpected storm of almost mid-winter severity has started a rush of small buyers into the hard-coal market and created a note of urgency in the situation. The improvement is apparent in both wholesale and retail. Concessions on the regular company circular are still to be obtained on certain grades, notably egg size, but as a rule the demand is heavy all along the line and there are even rumors that some companies have already been forced to draw upon reserve stocks. Lake shipping is relatively light.

Bituminous continues to show a weakening tendency although firm in spots. The Atlantic Coastwise business particularly, has fallen off heavily, and supplies are beginning to accumulate at the principal loading piers. The trade is conspicuous for the lack of interest in spot business and indications are that there will be a light demand for several weeks to come. Large tonnages are available and some price cutting is noted where it is found necessary to move coal promptly. Supplies at tide are larger and prices are being maintained only because of the fact that most of the production is well covered by contracts. Inquiries are only scattering but in the face of all these adverse conditions, operators are making a determined effort to hold the market in hopes that it will swing back to its former activity as seems probable under the change in weather conditions. The New York market has as yet failed to show any specific weakness although there is a slowing down which will probably continue until the first of the year.

The heavy storm in the Pittsburgh district created a sharp rush for domestic coal on which premiums were already in effect so that some fancy prices were obtained for prompt tonnages; on the other hand manufacturing demand is restricted, while lake shipping is slowing down, due to the lack of vessels as a result of the slow movement of ore. The heavy weather on the Lakes resulting in the loss of a number of vessels, has demoralized shipping temporarily and will tend to retard the last rush of coal to the Northwest.

The domestic trade in Ohio is active, the demand for all grades continuing heavy and prices showing a strong upward tendency. The car supply is still a ruling factor in the situation there and this has been further aggravated by the severe weather. The movement at Hampton Roads is about normal in all directions and there is a good supply of vessels. There is a fair accumulation at the piers but some shippers are still having difficulty in getting sufficient tonnage; coastwise business is mostly to New England. The Southern market is easier, the rise in the river having relieved the tension on Northern coals.

Prices in the Middle West are generally strong but fluctuate considerably. The recent touch of real winter stimulated the market perceptibly and checked the tendency to ease off. Operations continue heavy, any delay being due to poor car service rather than lack of orders. The situation locally looks encouraging.

BOSTON, MASS.

Dull market for Hampton Roads coals. Rumors regarding English syndicate in New River and probable labor troubles. Demand promises to be light for weeks to come. Georges Creek output likely to be curtailed for the present, and Pennsylvania grades show weak tendencies. Anthracite a shade easier on account of mild weather.

Bituminous—There are only a few relieving phases in the generally dull situation on Pocahontas and New River at tide. Some of the agencies have moderate business in prospect and are therefore quoting $2.90 f.o.b. for delivery 30 and 60 days hence, but most of the shippers are eager for such orders as can be had at the season basis of $2.85. There is, however, a notable lack of demand for spot coal, and supplies are beginning to accumulate at all the loading piers.

There is a good deal of talk regarding the rumored optioning of various West Virginia properties, principally in New River, by an English syndicate, but so far nothing tangible has been given out. If there is basis for the story and the deal should be carried out it would undoubtedly mean a reduced supply of Hampton Roads coals for New England. Any foreign purchasers would be sure to divert larger tonnages for export and such a development would work an important change with respect to this market.

Some apprehension over labor troubles in the spring in the same districts is being felt now and then. A determined effort seems likely to be made next season to organize both the Pocahontas and New River fields. This aspect of the situation will be watched with increasing interest as the season advances.

Spot coal for inland delivery continues rather a drug on the market. Prices are still off and there is a conspicuous lack of interest all over the territory. The storm on the 8th and 9th will doubtless shorten up shipments from West Virginia for a few days but from present indications the demand is going to be light for several weeks to come. Georges Creek shares in the situation on Pocahontas and New River. There are large tonnages available at all the distributing points, but since most of this grade is placed on a contract basis there has been no wavering in price. November, however, will probably show a materially lessened output.

The better grades from the Pennsylvania districts are on an easier price range than a week ago. At the same time, operators are trying to hold quotations in the hope that the market will swing back. There is little inquiry here and many are looking for a decided break. There is no apparent change in the dull outlook for the cheaper grades; f.o.b. New York there is a dearth of business outside of the bunker trade. All-rail coal is quiet, with only scattering inquiry. Consumers are well-stocked and requests to defer deliveries are far more frequent than orders.

Anthracite—The situation continues strong, although stove size does not seem in quite the short supply that was looked for. The mild weather has had some effect on the market and premiums this week f.o.b. New York have not been so general; 25c. is being paid in instances where a large proportion of stove is required, but egg and chestnut with individual shippers are barely holding to the circular. Barge rates out of New York are still at 65@70c. and the trade east of Cape Cod is therefore looking largely to Philadelphia for current supplies. Tows are moving more regularly and quite a fleet has sailed the past week from the Delaware for Eastern points. Ten days more will see the end of shipments up the rivers.

Quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.00@1.55	$1.25@1.65	$1.67@1.77	
Philadelphia*	2.25@2.80	2.50@2.90	2.92@3.02	
New York*	2.55@3.10	2.80@3.20	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@2.90
Boston†				3.75@3.88
Providence†				3.77@3.83

*F.o.b. †On cars.

NEW YORK

Hard coal active with indications that some sizes will shortly be out of the market; colder weather started a rush in retail. Soft coal in strong demand, but with an uncertain future. A tendency to slow down.

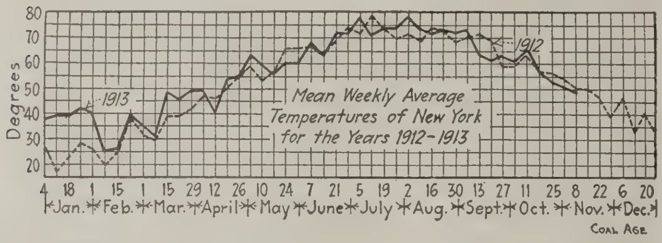
Anthracite—The local market on hard coal is strong all along the line with the possible exception of egg size. This grade continues to be difficult to move and many subterfuges are resorted to to dispose of it. The demand for stove exceeds the supply; a continuation of the prevailing cold snap will see stove coal entirely out of the market shortly. In the steam grades, business is good on all sizes, there being a tendency toward higher prices on pea coal.

The fall in temperature the early part of the current week had a notably stimulating effect upon the retail end of the business. Buying opened up freely, and the demand is insistent. The water movement out of New York Harbor is about normal. The car shortage in the mining regions has improved materially and now just about meets requirements, although not entirely satisfactory yet.

The New York hard-coal market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	....	$4.95	
Egg	5.25	$5.15@5.25	5.20	$5.00@5.20
Stove	5.25	5.25	5.20	5.20
Chestnut	5.50	5.40@5.50	5.45	5.35@5.45
Pea	3.50	3.40@3.50	3.45	3.35@3.45
Buckwheat	2.75	2.60@2.75	2.45@2.70	2.00@2.70
Rice	2.25	2.25	1.95@2.20	1.75@2.20
Barley	1.75	1.75	1.70	1.50@1.70

Bituminous—The recent storms have steadied up the soft-coal market and had a tendency to check the downward trend, but there is still a note of hesitancy and many think that the trade will continue slow during the balance of the year. It is a notable fact, however, that conditions locally maintain a generally better tone than at most of the other large distributing centers. The advent of winter weather, the slowing down of the movement and the possibility of a strike next April are the favorable conditions in the market against which is the serious contraction in general business and industrial activity, and the release of the large tonnages now going into the Lake business. The outlook rests entirely on the developments along these lines, and from present indications may go either way, the balance probably being slightly in favor of the producers at the moment.



The high volatiles are the heaviest and the most difficult to move, the better grades still being rather scarce and firm. The labor supply is better, the colder weather driving more men from outside vocations into the mines. Cars are generally in good supply on both the Pennsylvania and New York Central, but the situation on the B. & O. has been tight. More than the normal supplies are reported at tidewater, but the demand continues good and prices are being firmly held. We continue New York quotations on the same basis as last week as follows:

West Virginia steam, $2.65@2.75; fair grades of Pennsylvania, $2.75@2.85; good grades of Pennsylvania, $2.85@2.95; best Miller Pennsylvania, $3.15@3.25; George's Creek, $3.20@3.30.

BALTIMORE, MD.

Bituminous demand fallen off heavily and market weakening. Some price cutting to move coal promptly. Supplies at tide much larger. Car movement better.

Mild weather has depressed the anthracite trade here for the past week or ten days. There was a brief period of activity with the close of October, and while business is not dead by any means, it is not as brisk as many had expected. The soft-coal trade is struggling with a falling market. Demand has fallen off greatly, the steel and cement industries have cut off shipments on contracts, and the movement of coal to the Northwest has been curtailed.

The better-grade coals, which until 10 days or so ago had held firm, are now notably weaker. The high-grade Pennsylvania steam coals that had recently sold up to $1.45 and $1.50 are now to be had around $1.30 and $1.35. The lower-grade West Virginias are bringing about a dollar, which is also the prevailing price for slack. Three-quarter gas is offering as low as $1.05, which is a big reduction from the figures obtained during the height of the Lake season.

There is more coal at tide here the past week than for some time past, due to an exceptionally free car movement, and some sacrificing was done in a few cases. The movement over the piers on export was rather light, and the up-coast shipments on contract coals were only moderate.

PHILADELPHIA, PENN.

Anthracite trade continues to show improvement, with activity more marked as the season advances. All sizes but egg moving well. Bituminous trade lacks tone, but prices well maintained.

The past week has seen considerable improvement in the anthracite coal trade, both from a retail as well as wholesale standpoint. The demand for chestnut size has increased to such an extent, that it is understood the large operating companies have started to work on their storage piles, and with the inception of real winter weather, it is confidently expected that the lethargy in egg, which is about the only size that is dragging at present, will show marked improvement. One still hears of concessions, however, in egg, chestnut and pea sizes, in some cases as much as 35c. in the egg, and dealers claim that they can secure all they want at less than circular. There is no disposition, however, on the part of the large companies to meet this situation, circular prices still being maintained, their strength lying in the fact that orders for stove coal, which is far behind the market, must be accompanied by orders for the other sizes, and in this way, the production is being well taken care of.

Pea coal is beginning to feel the result of the winter consumption. This is particularly true of Philadelphia and vicinity, where large quantities of this size are used. The one- and two-ton lots are commencing to be heard now, which, after all, constitutes, in a large measure, the bulk of the business, and practically marks the beginning of the active season. Production is on about a parity with last year, with the usual crop of petty differences in the various mining regions. This has a tendency to reduce the output when it is needed the most, which is probably an effectual argument, from a miner's standpoint.

There seems to be a tendency to softness in the bituminous trade. It is claimed that the labor situation has about adjusted itself, resulting in an increased output, and as a consequence, while prices remain about the same, there is a more urgent quest for orders. They are not coming as easily as has been the case for months past, and salesmen are sent out with instructions to get business. It is slowly approaching its natural level.

BUFFALO, N. Y.

Market quiet. Movement on contracts the best feature. Serious break may occur unless more seasonable weather develops. Coke weak. Lake shipping of anthracite active.

Bituminous—The market is weak, but shippers will not make any price concessions, for they do not believe the business could be stimulated in that way. The consumer is indifferent to the market. One operator reports that an increased supply of cars has added to the weakness of the situation; he is able to run his mines at full capacity, although that is largely because a great part of his output is sold on contract. There was recently much regret because so much coal was contracted, but if anything pulls the market through now it will be this very feature. Some sellers wonder why the trade now is less than in June and July; the reason is that many industries reduce operations at this time, and if the weather does not create a demand, it must necessarily be slack. It is generally agreed that a snow storm would firm the market quickly.

The jobber and consumer anticipate a break in the market, while the producer fears the same, and looks to the weather as the one element in the trade that is most likely to prevent it. Prices are, therefore, weak at former figures, $2.90 for Pittsburgh select lump, $2.80 for three-quarter, $2.65 for mine-run and $2.25 for slack, the latter still being much firmer and scarcer than sizes. Allegheny Valley coal is about 25c. lower than Pittsburgh.

Coke—The market has shown additional weakness during the week, and all grades have been offered at reduced prices. Prices rule at $4.70 for 72-hr. Connellsville foundry, $4.20 for 48-hr. high-sulphur furnace, and $3.60 for stock coke.

Anthracite—There is little activity in anthracite except for lake shipment. After Dec. 1 the small amount shipped will have to pay an increased insurance rate and quite likely a higher freight. In spite of the need of more anthracite in the Northwestern trade, shippers were able to load only 124,000 tons into vessels during the week. The local demand for anthracite is light.

PITTSBURGH, PENN.

Pittsburgh district visited by great wind and snow storm, crippling telegraph lines and railroads. Manufacturing demand for coal slightly decreased. Pressure to maintain lake shipments. Connellsville coke quiet and slightly lower.

Bituminous—Last Sunday the Pittsburgh district was visited by a wind and snowstorm, which would be noteworthy at any time in winter, while as making the first snowfall of the season over a foot it was altogether exceptional. A sharp increase in the demand for domestic coal resulted in a market which was already showing premiums, and some fancy prices were paid for a limited tonnage. The manufacturing demand for coal has decreased a trifle further, as the iron and steel industry is steadily slowing down. Lake shipments have been temporarily much reduced as the first cold snap, even if a mild one, always ties up the railroads more or less, and when telegraphic communication is practically suspended, not much can be expected from the railroads in moving freight. A further incentive is furnished to prolong the Lake shipping season to the end of the month, but a difficulty is experienced in finding vessel room, as the ore shippers have greatly curtailed operations, October ore shipments showing a decrease from last year, while only a little is to be moved this month, and some shippers are already through. We continue to quote prices for short contracts and for prompt, subject to premiums for small lots of domestic, as follows: Slack, $1@1.10; mine-run, $1.40@1.50; ¾-in., $1.50@1.60; 1¼-in., $1.65@1.75, per ton at mine, Pittsburgh district.

Connellsville Coke—The sale of 10,000 tons of furnace coke at $1.90 a trifle over a fortnight ago, which sale marked the break of the Producers' Coke Co. from its $2.50 price, is shown now to have fixed the maximum of the market. Several lots of November and November-December coke have been sold at that figure, and last week a sale of 15,000 tons of standard furnace coke was made at $1.85. This price can easily be done on prompt lots, but there is no further demand. As to contract, there is no negotiation whatever, but it develops that some time ago, when the majority of operators were holding strongly for $2.50, a contract was made at $2.25 for the first half of 1914. In the absence of bids and offers this might technically be held to constitute a normal market. Foundry coke has weakened in sympathy with furnace coke. We now quote: Prompt furnace, $1.85; contract, nominal, $2.25; prompt foundry, $1.65@1.75; contract foundry, $1.65@1.75 per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Nov. 1 at 375,230 tons, a decrease of 10,440 tons, and shipments at 356,522 tons, a decrease of 32,522 tons.

COLUMBUS, OHIO

Unusual strength, the chief characteristic of the local trade. All grades are in good demand and the car supply is getting worse. Prices are firm and inclined to advance. Lake trade is still active.

Market conditions in Ohio are ruling firm in every respect and the tendency is upwards. The demand for all grades remains steady and no stocks are sold below the circular. Car shortage is still the chief factor in the trade. The supply is about one-half normal and in some cases the percentage is even lower than that. In the Hocking Valley field it has required considerable work on the part of railroads to furnish 50 per cent. while in Eastern Ohio and Pomeroy Bend the percentage is lower. The strictly domestic fields have suffered with the remainder of the producing sections of the state.

The domestic trade is probably the strongest point in the market. Dealers in Ohio and adjoining states are trying to accumulate a surplus to be on the safe side when the rush incidental to colder weather comes. As a result they have placed larger orders and are insisting upon immediate delivery. Delay in delivering runs from a few days to several weeks. One of the chief causes for the car shortage is the lack of motive power on the part of railroads. Retail stocks are only fair in this section and domestic orders are coming in well.

Lake trade is still a factor in the situation although it is not long until the close of navigation. The dockmen of the Northwest want as large a tonnage as possible rushed through, to prevent a large all-rail movement. As a result, every effort is being made to secure a good lake movement which is shown by the records of the loading machines at the docks of the lower lake ports.

Steam business is holding up well. Manufacturing establishments while not consuming a larger tonnage are placing more orders so as to guard against a fuel famine. As a result stocks are growing gradually larger. Railroads are using quite a large tonnage in their freight movement.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump.....	$2.00 @ 1.90	....	$2.25 @ 2.15	$2.00 @ 1.90
3-4 inch...........	1.85 @ 1.75	$1.50 @ 1.40	2.00 @ 1.90	1.85 @ 1.75
Nut...............	1.30 @ 1.20	....	1.75 @ 1.65	1.40 @ 1.35
Mine-run..........	1.50 @ 1.40	1.35 @ 1.30	1.50 @ 1.40	1.50 @ 1.45
Nut, pea and slack..	0.90 @ 0.85	....	1.00 @ 0.90	0.85 @ 0.80
Coarse slack........	0.80 @ 0.75	1.00 @ 0.95	0.90 @ 0.80	0.75 @ 0.70

DETROIT, MICH.

Car supply worse than was anticipated. Situation hinging on this feature. Domestic coals quiet due to unseasonable weather.

Bituminous—As was anticipated, the car supply has at last become the controlling feature in the situation here. Conditions are even worse now than was expected and shippers are being taxed to the limit to meet their contracts. Reports from some districts place the car supply as low as 20%.

There are very few cars of free coal on track here. Prices are firm on all grades, with the exception of certain sizes of Hocking, which have shown signs of weakness. West Virginia nut and slack are quoted at 90c., with mine-run, both for spot and contract, at $1.15. There is very little new business being done in domestic coal, due to the unseasonable weather recently. Conditions have improved in this respect, however, and prices are showing a rising tendency.

The market is now quotable on the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump.	$1.65	....	$2.00	....	....	$2.75	$2.50
Egg...........	1.65	....	2.00	....	....	2.75	2.50
Nut...........	1.50	....	1.65	....	....	....	....
Steam lump....	1.50	....	....	....	....	....	....
¾-in. lump......	1.35	$1.35	1.35	$1.35	$1.35	....	....
Mine-run.......	1.25	1.15	1.15	1.15	1.15	1.50	....
Slack..........	0.90	0.95	0.65	0.90	0.90	....	....

Anthracite—Shipments are coming in better than was anticipated, and the supply of stove coal is greater, although there are now indications of a surplus.

Coke—Connellsville coke has taken a sharp slump in the local market. Foundry coke is being quoted at $2.50, f.o.b. ovens, while Semet Solvay and gas house remain unchanged.

HAMPTON ROADS

Movement during week only about fair. Piers well supplied with bunker tonnage. Prices stationary, although demand is heavy.

The movement of coal from Hampton Roads piers during the past week has only been about normal. There has been a good supply of bunker vessels and also some large cargoes moving from tidewater but no extra heavy shipment. Foreign shipments have gone to Canal Zone, Kingston, Havana, Cienfuegos and Rio de Janeiro. Practically all of the coal moving coastwise has gone to the New England market, about the largest percentage being consigned to Boston and Providence. The coal moving both coastwise and foreign has been principally Pocahontas and New River.

Prices have changed but little during the week, remaining about the same as they have been for the past ten days or more. There is a fair accumulation of coal at tidewater piers, although a number of the shippers are short and have had difficulty in getting sufficient coal forward to take care of contracted tonnage on hand.

LOUISVILLE, KY.

Colder weather has had a reviving influence on the trade. Heavy river shipments relieving the shortage in this department. Price advance anticipated.

The car shortage and the Election holiday of last week affected production to such an extent that the fear of an oversupply has been eliminated for the time being. Colder weather has also had its effect upon the situation, and the market is notably stronger. The rather backward season, up to the recent cold snap, was having a depressing effect upon the outlook. Heavy rains in the upper Ohio Valley have opened up river transportation and large tonnages are now en route for this district. The companies handling river coal have been so hard pressed that they have occasionally been compelled to resort to the local rail products.

The heavy demand for eastern Kentucky coal in the North still continues, and will no doubt increase as the season advances. The only uncertain factor in this trade is the limited supply of gondola equipment, which is the kind most commonly required. The new "battleship" cannot usually be applied on this business. An advance in quotations effective Nov. 15 is being discussed; $2.50 f.o.b. mines will probably be the new price on block coal, with the lower grades ranging down at the customary differential. At the moment, orders are plentiful at $2.35, at which figure the dealers claim they are unable to make any profit because of the low-priced contracts they have with consumers.

The over-supply of screenings in this market seems to have been eliminated at last. Colder weather has caused the heating plants generally to come into action, so that there is a large healthy consumption at the moment. The western Kentucky market is more active than for some time, and the steam grades are particularly strong.

BIRMINGHAM, ALA.

Steam coal shows slight improvement. Due to cold weather, domestic is also in a more healthy demand. Blacksmith normal and furnace and foundry coke quiet. Pig iron more active. Car supply still short of requirements.

The steam coal market shows a slight improvement over last week, though it could not be called in a good condition. The demand is slightly better, with prices about the same. Following in the wake of a cold snap, domestic coal shows quite an improvement, with a large increase in the demand. While some of the higher grades have been sold up for some time, the lower grades have suffered for want of orders, but the cold weather is bringing out the inquiries for it.

Blacksmith coal is moving satisfactorily, the demand gradually increasing from week to week. Very little is doing in either furnace or foundry coke, but the prices are holding up. Pig iron is more active, and while the sales are not large, the price is holding $11.50 2Foundry being the basis.

The car supply is still short of the requirements, especially on the Southern Railway and no great improvement is looked for in the near future.

NEW ORLEANS, LA.

Falling off in shipping affects coal consumption decidedly. Exports to Latin America increase. Cane mills are requiring more coal this year.

Compared with this week last year, coal consumption took a decided slump, due to the difference in the harbor demand. Owing to the slowness with which the cotton crop is being marketed, there is little activity in shipping. High ocean freight rates have practically stopped the lumber movement. Domestic demand is good. Exports to Latin America have been much heavier, while the cane mills are laying in large supplies in anticipation of one of the longest grinding seasons in many years.

Much of the tension evidenced in the local market has been relieved by the unusually early rise in the Ohio, which assures relief to the fast dwindling stocks held by the Northern companies.

In order to be assured that everything is being done to make this port the principal coaling supply station for the Panama Canal and Latin America in general, the Association of Commerce is investigating conditions. Owing to the very unusual circumstances existent here, none of the local interests are in a position to gage future action. The whole situation hinges on the possibility of bringing Alabama coal to this port by water.

INDIANAPOLIS

Expectation of mild weather in Indiana and perhaps lower prices not realized. Mines are running full time except when interrupted by car shortage, which is not serious. Prices hold steady.

It was expected the continuance of mild weather would have a distinct effect on the coal industry of Indiana, in volume of trade if not in weakening prices. It has not done so, however, and the recent taste of real winter put an end, at least temporarily, to those misgivings. Operations at the mines have kept up well, most of them being on full schedule; delays are due entirely to the car situation and not a lack of orders. However, less is being said about car shortage. It is still a factor, especially with the Big Four, but operators have long been used to that and plan their business methods accordingly.

A street-car strike in this city for eight days, during which no cars moved and which stopped interurban traffic at the city limits had a paralyzing effect on business generally. This included the largest consumers of coal, the power houses of the city and interurban lines. Prices hold steady at the mines and retailers of the city let the first of the month go by without changing their quotations, which remain at the basis fixed Sept. 20.

CHICAGO

Prices for steam coal higher. Drop in domestic ranging from 10c. to 25c. a ton. Car supply still inadequate. Western coals a trifle weak, Springfield producers cutting some prices as much as 10c. a ton.

Additional strength in prices for steam coal and a decline in quotations for domestic are the leading features in the Chicago market. It may be said, in addition, that the general business outlook is causing operators considerable worry.

There has been a drop in domestic coal prices ranging between 10c. and 25c. a ton, while an advance of from 5c. to 10c. a ton has been noted in the steam grades. Although idle coal cars are increasing in number, the car supply remains unsatisfactory, due chiefly to a lack of expeditious car movement. Western coals are somewhat weak, Springfield operators cutting prices in some instances as much as 10c. a ton. Springfield domestic lump is selling in Chicago at from $1.60 to $1.65 with the country price remaining at the circular figure of $1.75. Domestic sizes from the Franklin County field are selling at from $2 to $2.25. Operators who are oversold are adhering to the $2.25 quotation, while others whose orders are not so plentiful are shading.

The price for Carterville lump, egg and No. 1 washed remains at $2, the mines, warmer weather, apparently, having failed to influence the operators in that region. Dealers in Hocking coal are still complaining about insufficient service by the rail carriers. Prices, however, remain unchanged with comparatively little of this fuel coming all-rail to the Chicago market. Smokeless lump and egg are stronger and the price for mine-run a trifle easier; the general figure for the latter is $1.40, the mines, although some sales have been reported at $1.50. Lump and egg are quoted in Chicago at $2.25, the mines. In the country districts sales are made on the basis of $2.50.

The movement in furnace and foundry coke is fair, but spot sales are small in volume. On account of weather conditions there has been a decrease in the movement of byproduct coke. The market for screenings is improving.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.57	$3.05@3.30	$2.52	
Steam lump	2.07		2.07	
Egg		3.05@3.30		$4.30@4.45
Mine-run	1.92	2.40@2.55	1.87	3.45@3.55
Screenings	1.12@1.22	1.55@1.80	1.12@1.22	

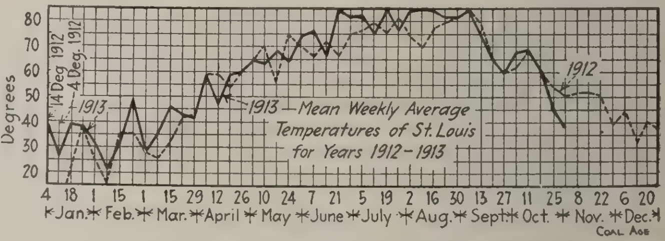
Quotations on Harrisburg coal are: Domestic lump and egg, $3.05; steam lump, $2.65@2.80; mine-run, $2.40@2.55; screenings, $1.55@1.80; No. 1, nut, $1.75@1.80; No. 2 nut, $2.55@2.80. Carterville prices are: Lump, egg and No. 1 washed, $3.05; No. 2, washed, $2.65.

Coke—Connellsville, $5.50; Wise County, $5.25@5.50; byproduct, egg and stove, $4.90@5; byproduct, nut, $4.95@5.10; gas house, $4.95@5.

ST. LOUIS, MO.

Car supply conditions improving and plenty of domestic coal. Weather conditions keep prices irregular. Steam sizes looking up.

Irregular weather has kept the market in a somewhat uncertain condition. For one or two days last week prices were inclined upward but they would drop back again. Indications the early part of the week were that the market would be likely to stiffen up some, although if the car supply for the next week is as good as it was last week there will be plenty of coal. All of the railroads did better the past week than they have for some time.



Steam coal has picked up some, especially from the Carterville field, and screenings are easily bringing from 50 to 60c. Standard screenings, however, are floating along from 15 to 25c. The standard market is still too low to be profitable for operators, although Carterville is doing exceptionally well. On foreign coals everything is quiet.

The prevailing market is:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$1.05@1.15
3-in. lump	....	....	$1.50	....
6-in. lump	$1.75 @ 2.00	....	1.60	1.35@1.50
Lump and egg	1.85 @ 2.15	No quotat'n	....	....
No. 1 nut	1.60 @ 1.75	....	....	....
Screenings	0.40 @ 0.50	....	....	0.10@0.20
Mine-run	1.10 @ 1.20	....	....	....
No. 1 washed nut	1.85 @ 2.00	....	1.40	....
No. 2 washed nut	1.50 @ 1.65	....	1.60	....
No. 3 washed nut	1.15 @ 1.20	....	....	....
No. 4 washed nut	1.00 @ 1.10	....	....	....
No. 5 washed nut	0.50 @ 0 60	....	....	....

KANSAS CITY, MO.

Market steadying up under the influence of more seasonable weather conditions. Inadequate gas supply a factor in the situation.

The market has been weakening somewhat under a steady stretch of warm weather, but is now showing signs of stiffening as the weather conditions become more favorable. The Indian summer has given way to more seasonable weather, and prospects are for better conditions the remainder of the year. The warm weather resulted in no changes in quotations, but operators were inclined to concede something in order to keep their output moving. Others took advantage of the lull in order to pile up stocks in anticipation of a higher market a little later.

Cold weather has had a settling effect and all lines are now moving briskly. Kansas nut, which has been weak, has braced up well, while block coal, also showing little life, responded immediately to the cold wave. Should the weather continue cold, the expected advance of 25c. will go into effect around Thanksgiving. Inquiries are coming from all sections of Kansas and Missouri, because of the unsatisfactory natural gas situation.

PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

The following is comparative statement of the anthracite shipments for October and the first ten months, of the years 1912-13, in long tons:

	October		10 Months			
	1913	1912	1913	%	1912	%
Phila. & Reading....	1,232,367	1,434,923	10,736,917	18.64	10,385,395	20.17
Lehigh Valley.......	1,162,850	1,217,297	10,834,778	18.80	9,505,104	18.46
Cent. R.R. N. J.....	906,525	938,297	7,701,931	13.37	6,769,128	13.14
Del. Lack. & West..	895,252	970,139	8,253,236	14.32	7,325,085	14.22
Del. & Hudson......	625,049	589,717	5,928,124	10.29	5,126,694	9.95
Pennsylvania.......	593,800	547,061	5,204,132	9.03	4,495,080	8.73
Erie...............	709,400	756,452	6,828,702	11.85	6,059,536	11.77
Ont. & Western.....	212,951	211,435	2,132,259	3.70	1,834,518	3.56
Total.........	6,338,194	6,665,321	57,620,079	100.00	51,500,540	100.00

Stocks at Tide on Oct. 31 were 603,223 tons as compared with 577,805 tons on Sept. 30.

LAKE SHIPMENTS

Anthracite Shipments through the Sault canals for the current year to Oct. 1 were 2,110,934 tons as compared with 1,321,452 tons for the same period last year.

Bituminous Shipments for the same periods were 12,610,557 for the current year as compared with 9,544,129 in 1912, making gross of 14,721,491 for 1913 and 10,865,581 in 1912.

NORFOLK & WESTERN

The following is a statement of the tonnage shipped over this road during September, 1913, and for the nine months ending Sept. 30, as compared with corresponding periods of 1912 in short tons:

Coal	1912	1913	1912	1913
Tidewater, foreign.......	68,672	107,814	1,094,529	1,236,387
Tidewater, coastwise.....	331,489	295,402	2,768,700	2,892,968
Domestic...............	1,528,376	1,706,260	13,245,863	13,805,544
Coke				
Tidewater, foreign.......	....	....	52,762	27,189
Domestic...............	113,035	121,451	1,014,174	1,153,761
Total..............	2,041,572	2,230,927	18,176,028	19,115,859

COAL FREIGHT DECISIONS

I. C. C. No. 4652—Lebanon (Kentucky) Commercial Club vs. Louisville & Nashville R.R. Co., et al.

Local rates for the transportation of bituminous coal in carloads from mines located on the Louisville & Nashville R.R. in Virginia and Tennessee to Louisville, Ky., are less than to Lebanon, Ky., an intermediate local point 67 miles nearer to the mines than is Louisville, and vary according to the grade of the coal, while the rates to Lebanon are not so varied; **Held:**

That as the rates to Louisville are influenced largely by the movement of bituminous coal by the Ohio River and by competing rail carriers, the lower and varied rates to that point have not been shown to be unjustly discriminatory as against Lebanon.—**Opinion No. 2432.**

FOREIGN MARKETS

GREAT BRITAIN

Oct. 31—The demand for practically all classes of large and small coals continues active and admiralty list coals particularly are difficult to secure for early positions. Tonnage is being delayed by stormy weather but the docks are fairly well supplied with ready vessels. Outputs are improving somewhat, although still below normal. Quotations are approximately as follows:

Best Welsh steam......	$4.80@4.92	Best Monmouthshires..	$3.96@4.08
Best seconds..........	4.56@4.68	Seconds..............	3.72@3.90
Seconds...............	4.32@4.44	Best Cardiff smalls	2.52@2.64
Best dry coals.........	4.32@4.56	Seconds..............	2.34@2.46

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, exclusive of wharfage, and for cash in 30 days.

AUSTRIA

Coal exports for the first half of the current year amounted to 2,307,998 tons as compared with 2,218,602 for the same period last year. Exports to the United States for the same periods were, 42,229 and 46,474 respectively; to Canada 15,256 against 17,520 in 1912 and to the Philippines 18,692 and 43,189 respectively.

SPANISH IMPORTS

Coal imports into Spain for the eight months to Aug. 31 of the current year were 1,818,354 metric tons, compared with 1,486,111 tons for the same period last year. Coke imports for this period of the current year were 239,507 tons as compared with 242,355 tons for the same period last year.

Martinique (French West Indies)—Total coal imports into this port in 1912 amounted to 392,628 tons of which the United States furnished 376,734 tons.

Australia—A notable feature of Newcastle trade last year was the large increase in the quantity of coal exported to places beyond the State, the total being 5,030,308 tons, valued at $12,739,006 in 1912 as compared with 4,061,780 tons, valued at $10,301,981 in 1911.

In the foreign markets a slump may occur at any time, to the loss of the shippers; even where contracts have been entered into, the increase in freights may destroy the profits. That was the case in respect to the coal sent to some foreign markets during the last six or eight months. Freight rose to such a figure that even coal of a good quality realized only 75c. or $1 a ton after all charges were met. At these figures the companies lost on every ton handled.

Among foreign consumers of Newcastle coal Chile easily stands first and during 1912 took a very large quantity. Coal was also placed in other markets, and a fair quantity went to the East. However, in the latter field freights are a big handicap, as Japanese vessels are able to take coal to Manila, Singapore, and other Indian ports and get return cargo. Until rates are more favorable, the prospects are not good for placing a great quantity of coal in the Eastern markets.

Exports to the United States fell of sharply to 129,252 tons in 1912 as compared with 203,128 tons during 1911.

COAL SECURITIES

The following table gives the range of various active coal securities and dividends paid during the week ending Nov. 8:

	Week's Range			Year's Range	
Stocks	High	Low	Last	High	Low

FINANCIAL DEPARTMENT

Nova Scotia Steel & Coal Co.

President Robert E. Harris reports for the year 1912 as follows:

Results—The depression in the United States also depressed the price of and restricted the market for our ore in that country. Another difficulty was the great coal strike in Great Britain, during the spring of 1912, which closed down for several months a large proportion of the blast furnaces of that country, with the result that our market there for Wabana ore was practically cut off for the balance of the year.

In view of these adverse conditions, we may congratulate ourselves upon the fact that our profits were as large as they were, namely, $1,000,610 [contrasting with $1,019,392 in 1911], while, after paying our usual dividends of 8% on the preferred and 6% on the common shares, we carried $452,601 to profit and loss, which is only $56,000 less than in 1911.

Additions—During 1912 we made further large expenditures [aggregating $1,279,569] in improving our plant and developing our resources. We contemplate further expenditures along the current year in opening up a new colliery at Sydney Mines, further developments at Wabana and some improvements and additions to plant, which would give a further increase in outputs and from which we are warranted in expenditure made on capital account in 1912 and the contemplated expenditure of the present year, we have since the beginning of this present year disposed of $2,000,000 treasury debenture stock.

Eight Years' Record—In March, 1905, the board elected me as president. A comparison of some figures for 1904 may prove interesting.

1. Capital, etc.	Stock, Bonds, etc.	Profits	Employees	Wages	Per Man
1904	$9,859,800	$501,337	3,449	$1,609,754	$467
1912	14,000,000	1,000,609	5,600	3,192,498	570
Increase	42%	100%	62%	100%	22%
2. Output (in Tons)	Ore Mined	Coal Mined	Pig Iron	Ingots	Forged, etc
1904	246,022	476,521	31,567	30,000	25,958
1912	533,000	841,528	68,784	77,940	71,284
Increase	116%	76%	118%	160%	175%

[Royalty paid in 1912 to Govt. of Nova Scotia on coal mined, $76,128.]

Output of Calendar Years (in Tons).

	Coal	Wab. Ore	Coke	Pig Iron	Steel Ing.	Steel Bill.	Bars, etc.
1912	841,528	555,000	85,334	68,784	77,940	71,284	(?)
1911	780,468	521,011	97,580	84,497	83,718	78,004	(?)
1910	847,176	532,058	90,360	65,484	73,019	59,244	50,915
1909	809,341	460,387	87,816	58,676	64,240	52,931	45,090

⁂

Pocahontas Coal & Coke Co.

The 17th annual report of the N. & W. Ry. embodies the following, re the Pocahontas Coal & Coke:

The production of coal during the year from lands leased to mining companies by the Pocahontas Coal & Coke Co., aggregated 12,244,736 net tons, an increase of 954,697 tons or 8.46% over the preceding year. About 91,139 tons were consumed at the mines and 1,171,887 tons were converted into coke. From these lands, your company received for shipment 9,953,252 net tons of revenue coal, 725,765 tons of revenue coke and 1,004,424 tons of coal for its fuel supply. From other lands on your Company's lines, it received for shipment 10,535,786 net tons of revenue coal, 842,283 tons of revenue coke and 1,722,895 tons of coal for its fuel supply.

The sinking fund, provided for in the Pocahontas Coal & Coke Co.'s Purchase Money First Mortgage, dated Dec. 2, 1901, amounted in the calendar year 1912 to $266,627.06. Through this and other sums paid to the Trustee under the terms of the mortgage, bonds aggregating $302,000 were purchased and canceled. From the beginning of its operation in 1906 to date, the sinking fund has received from royalties on coal mined the sum of $1,425,798.71 and from sales of lands the sum of $124,800.52, a total of $1,550,599.23; by means of which there have been purchased and retired bonds to the aggregate amount of $1,716,000, reducing the outstanding bonds to $18,284,000, and leaving a cash balance of $847.48 in the sinking fund.

The income of the Pocahontas Coal & Coke Co., after providing for the mortgage sinking fund, was insufficient for the payment of the interest on its mortgage bonds. The deficiency was advanced by your company and the Pennsylvania Lines West of Pittsburgh, your company's share, two-thirds, or $92,999, being charged to income.

The work of unifying the company's properties, completing its titles and surveying, monumenting and mapping its lands has made further substantial progress. Your company has advanced to the Pocahontas Coal & Coke Co. for these purposes the further sum of $20,000, making a total to date of $1,292,000 charged in your company's accounts as advances to that company for property expenditures.

⁂

Colorado Fuel & Iron Co.—The additions made during last year's operations brought the gross working capital of this company up to $19,130,000, which is equal to more than half of the entire outstanding capital stock. In spite of the encouraging progress the company has been making, however, it must be remembered that the $14,000,000 five per cent. 10-year convertible debentures owned by the Colorado Industrial Co. matured in August, 1911, and are now overdue.

Susquehanna Coal Co.—In view of the fact that this company paid its first dividends last year, it would seem that the Pennsylvania R.R. would have ample cause for wishing to dispose of such an unprofitable investment. The disbursements amounted to only $85,472 or 4% on the $2,136,800 stock all of which is owned by the railroad company. In 1908 and 1909 interest payments amounting to $360,000 or about 6% on the investment were made each year. This fell off to $240,000 in 1910, but increased again to $300,000 in the two succeeding years.

225 H. P. Westinghouse Motor Driving Mine Hoist Previously Operated by Steam.

Replace your steam-hoist engine by electric motor drive and thus secure more reliable and economical operation.

Westinghouse Motors

For Driving Mine Hoists

are especially designed for this work. Heavy pulling power permits quick starts. Small diameter of rotor facilitates quick stops and reversals. Low power consumption insures economical operation.

They will withstand the heaviest overloads without injury and will last for years with practically no attendance. All parts subject to stress and wear are much stronger than the demands of the service require, and are easily inspected and renewed.

The conditions surrounding mine hoist service have been carefully studied by the Westinghouse engineers, who will be glad to assist you in converting hoists from steam to electric operation.

Write today for full information regarding Westinghouse Mine Hoist Motors.

The Market Place

HERE'S Adventure, here's Romance,
Here's the Proof that men advance;
Here is Progress, here is Change,
Here are wonders new and strange,
Proffered right before your eyes
By the men who advertise!

Can't you see them? Can't you sense
Spirit of a day intense,
Glory of a glowing time,
Marvel of an age sublime—
In these pages crowded with
Things that once were but a myth,
Now presented to your view
As a goodly dream—come true!

If we've conquered land and sea
With our vast machinery,
If we probe the depths and dare
Highest reaches of the air,
If, by dint of steel and steam
We are winning to our dream—
HERE the reason why is seen
Fate must bow unto our will,
Puncher, hoist, conveyor, screen
Pump and fan and lamp and drill—
As they help us get our coal,
So they help us win our goal.

Not a steamer plows the deep
Not a train through space is hurled,
Not an engine shaft is whirled,
Not an aeroplane may sweep
Battling with the vagrant breeze
High above the humdrum world,
But acknowledges a debt
To the power of the coal,
Which these tools go down and get
From the blackness of the hole.

Therefore we can truly say,
HERE'S the glory of Today,
HERE is Progress, HERE is Change,
HERE is all the wondrous range
Of the miracles of man
For your seeking eyes to scan;
Here's the magic of the ages
—In the Advertising Pages.

COAL AGE

Vol. 4 NEW YORK, NOVEMBER 22, 1913 No. 21

The District Superintendent

By Berton Braley

Written expressly for Coal Age

I

He is the boss of the outfit,
He is the Chief, the Nob,
The Heap Big Noise of all the boys,
The Lad with the Heavy Job,
The Owner's the upper millstone
And the men in the mine the nether,
And the supe, I ween, is in between,
And they're grinding him fine, together!

II

For the owners howl for profits
And the miners howl for pay,
And both sides whoop at the poor old Supe,
He catches it either way;
He's always in boiling water,
His life is never tame,
Whatever goes wrong it's the same old song
—He's certain to get the blame!

III

When dividends sag a little,
When work gets a trifle slack,
The working crew and the owners too
Just jump on the Super's back;
If the timbers crack in a runway,
Or a mule should get the croup,
Or, the lights go out you hear this shout,
"Oh send for the District Supe!"

IV

He always sleeps with his boots on,
He's never off shift at all,
For he's got to leap from his hard-earned sleep
Whenever he gets the call,
And if there is "hell a poppin' "
From cave-in or damp or fire,
He leads the fight by day or night
With a courage that may not tire.

V

He's boss of the hoist and breaker,
Of entry and room and shaft,
By study and fret and toil and sweat
He's mastered the mining craft,
He carries a load of worries,
His job is a damn hard berth,
He goes the route—and his pay's about
A quarter of what he's worth!

IDEAS AND SUGGESTIONS

Mine Accidents and Their Relation to Management

By Ralph D. Brown*

The industrial and labor problems become more complicated every day, bringing before us more forcibly the question of the inter-dependence of man. Every person, whether he be laborer or captain of industry, owes his fellow workers all possible diligence in the prevention of accidents. This is his social duty. The extensive "Safety First" movement is without force unless it is backed by scientific coöperation of employer and employee.

The enthusiasm of first-aid meets which have been frequently held in various coal-mine camps is induced more by the love of popular approval and rivalry than by any sense of duty. If rivalry is to be appealed to, why not have a contest with a prize for the miner who kept his working place in the safest condition without unnecessary cost, or a prize for the organized rescue party that could reproduce ventilation in a trial district under conditions similar to those met with in mine explosions or fires?

Perhaps the cheering spectators, consisting of appreciative mothers and sisters could not be provided, but the same publicity might be procured in another way. It is not our intention to detract from the value of first aid, but simply to point out that the results of negligence and ignorance should not be given prominence over the study of the cause and the prevention of accidents.

Cost of Accidents

Disregarding the human or ethical side of the question, what is its economical value? In order to apply our arguments in as practical a manner as possible, let us assume a bituminous mine in operation in the Illinois field, producing 2000 tons of coal per eight-hour shift. With this idea in view, the information in accompanying table was taken from the Illinois Coal Report for 1912.

TABLE OF ACCIDENTS IN ILLINOIS MINES—1912

Mine	Tons Mined 1912	Men Employed	Accidents	
			Fatal	Injured
O'Gara No. 4	244,900	292	1	5
Wasson Coal Company	259,421	258	2	7
W. P. Rend Coal Company	267,441	295	3	5

Black Diamond Coal Co.	311,600	282	1	0
Bunsen Coal Co., No. 3	297,588	296	1	4
Clark Coal Co., Empire No. 2	253,414	280	1	2
LaSalle County Coal & Coke Co.	205,737	443	1	7
Superior Coal Co., No. 1	673,717	562	2	6
Average Mine	295,107	328	1¼	4¼

A representative mine was chosen for each district in order to obtain a fair average, and only those accidents where the injured was absent from work more than 30 days were included.

From this data we may assume that the average per year is one man killed and four seriously injured, for every three hundred men employed. Computing then the average time required for the injured to return to work, we find it is near sixty days. We will say that eight weeks is a fair figure. In case the operator chose to accept the protection of the Workman's Compensation Law of Illinois, it is possible to obtain an estimated value of the actual monetary loss for the average mine which was assumed before. One death claim at $3500 and four serious injuries requiring an absence of eight weeks' duration each, at $12.50 per week, would amount to $3900. Add to this claims for twelve nonserious injuries and numerous minor claims, and we have a total near $5500, which is a conservative estimate.

As a check on the above calculation, let us employ another method. A large protective insurance company operating in this field assumed all risk up to $5000 per individual at the rate of 2¼ per cent. of the total payroll. The average mine assumed with a yearly tonnage of 295,107, and an average labor cost of 75c. per ton, would give us $221,330 for the payroll of the working days. Add to this $20,000 for the idle days' cost and we have a yearly payroll of $241,330. Adopting the rate of 2¼ per cent. for insurance, we find that the protection for this mine will cost $5428. The comparison between this figure and the one obtained previously, indicates that we are near a fair value. There are also other items that really enter into an insurance cost, such as the hazard of a serious explosion in a large producing mine, or the loss of time due to a portion of the mine being closed on account of local fires, etc.

More Efficient Supervision Desirable

There can be no doubt but that a large portion of this insurance cost may be reduced by efficient management. Each mine may have its own peculiar problems, but general principles will apply everywhere. Much has been written in regard to more efficient management of factories, but little has been written that applies to mining. The management of a large coal mine is entirely different from that of a factory for the followng reasons: 1. The labor is more highly organized. 2. The labor is more inaccessible to supervision. 3. The product requires little technical skill from the miner. 4. The negligence of one may jeopardize the lives of all.

To obtain results in a mine, many bosses are required to personally oversee the various labors being performed. It is easy to shirk in the dark recesses of the mine, and it is also easy to break the state laws, which are made for the protection of the miner. The act may be through ignorance, or it may be done maliciously, but it is not so liable to happen if a boss is known to be constantly near. Why not apply some of the $5500 yearly expense in a practical way by hiring additional bosses as assistants to the mine manager? Let each assistant have his own special district for which he alone is responsible. The state records show that about 46 per cent. of all accidents are caused by falls of slate, rock or coal, and it is this class of injuries that can be reduced at least one-half if efficient supervision is provided. Other classes may also be reduced materially, but here the cause of the accidents can be anticipated.

---

*O'Gara Coal Co., Harrisburg, Ill.

EACH COMPANY SHOULD EMPLOY AN ASSISTANT MINE MANAGER

If the mine is provided with an assistant mine manager in charge of districts working 50 men or less, the following duties of managements which are ordinarily impossible in the rush of getting out coal, could be more readily carried out:

1. Visit every working place or workman at least once every two hours.
2. Instruct miners and timbermen as to the exact location and manner of setting all timbers.
3. Personally order and inspect the delivery of all timber and track material for each working place.
4. Permit no material to be lost in the abandoned works. In some mines this item alone will pay the salaries of all assistant mine managers.
5. Allow no shot to be fired until the drilled hole and the prepared cartridge have been inspected.
6. Provide a good air current and maintain full pillar width in all working places.
7. Pay especial attention to all day men who may be doing shift work, due to the fact that their working places were unavailable at that time from falls of rock or other causes.
8. Maintain discipline and justice at all times.
9. In case a large percentage of the labor is foreign, at least one of the assistant bosses should be able to give instruction in the miner's native tongue. Accidents due to ignorance could be much reduced if a full explanation of the law and its application was made to all concerned. This is especially true in the case of gaseous mines where the safety of all is in the hands of each employee.

A SET OF GENERAL RULES NOT POSSIBLE

It is useless to lay down fast rules to cover every case, for each mine is a special problem. In some instances the labor question is predominate, in others, the physical character of the operation is the principal problem to be solved. Consequently, no special organization can produce the best results in all localities. There is one rule, however, that applies to all, and that is, that we insist that all company men comply with the law in every particular, and that no disobedience of the law be permitted, regardless of the cost or the question of the justice of the statute. The time to fight an adverse law is before it is passed, and not after. If the company complies with the law, it is much easier to maintain discipline among the men, and discipline is preëminently necessary.

THREE IMPORTANT ISSUES

In conclusion, we desire to point out three important issues in the safety-first movement, that will need to be more fully developed before this movement can be greatly successful:

1. Strict obedience to the law.
2. Better educational supervision.
3. Coöperation of the U. M. W. of A.

The third issue has received little attention to date, but is absolutely essential for a satisfactory solution of the problem of scientific prevention of accidents.

Education Is Not the Only Requisite in Mine Superintendence

By CHARLTON DIXON*

There have been several articles published in COAL AGE recently, advocating the acquirement of more knowledge, profounder study and greater mental development generally for mine officials, which is commendable. The same advice might be given to the important men of other vocations with equal applicability; in fact, to everyone.

But after having been employed in a capacity which brought me in contact with a large number of mine superintendents and foremen, many of whom it was my duty to report on, I am convinced the desideratum is not a lack of knowledge so much as energy in applying the information already acquired.

With few exceptions, they were intelligent men, readers of general literature, but particularly that pertaining to their calling. One was a fair botanist, several were musicians, another was a preacher, a couple were quondam teachers and a few had been educated as engineers. In spite of such abundant education, mules were wading through seas of mud, motors traveling over submerged track, doing work particularly adapted to submarines. roads were in bad condition, rooms being lost for want of proper timbering, entries going awry, animals overworked, motors loafing on account of side tracks being too far back from the face, ventilation was poor, inspectors were dissatisfied and men were growling. The cause was not due to dearth of knowledge, but rather the failure of these officials to concentrate their education and apply it in a practical way.

A MINE SUPERINTENDENT MUST BE ON THE FIRING LINE

The above conditions were nearly always attributable to the superintendent's propensity to avoid the inconveniences of the firing line. In other words, inspection trips through the mines were only made when they could no longer be avoided. In order to maintain his interest in a mine, the superintendent must spend much time underground, so as to keep thoroughly posted on all that is being done. If such a policy is not followed, deterioration sets in, bringing a train of trouble in its wake; this takes the spirit out of the superintendent and foremen, filling them with regrets and future fears. The result is a wild form of paralysis of the managing faculties, often culminating in dismissal of the superintendent, the position being given to someone of less wisdom but more energy.

The combination of thorough knowledge with indefatigable physical activity is necessary to success in many vocations, but particularly so in the managing of a coal mine. It cannot be done by proxy. The work to be done efficiently must be constantly under personal surveillance. Yet many superintendents visit the inside but once a week, a few go under once a month, others only when they have to. It is a fact, therefore, that for every dollar lost by want of knowledge in mine officials, three are lost through lack of energy and application.

⁂

The Béthune Mining Co., of France, in 1904, began experimenting with reinforced concrete as a material for lining the entries, which were walled with 20 in. of ferro-concrete, supporting rolled joists which carried the roof. The experiment was so successful that the work was extended until several miles of roadway are now lined with reinforced concrete.

Pillar-Drawing Methods in Fairmont Region

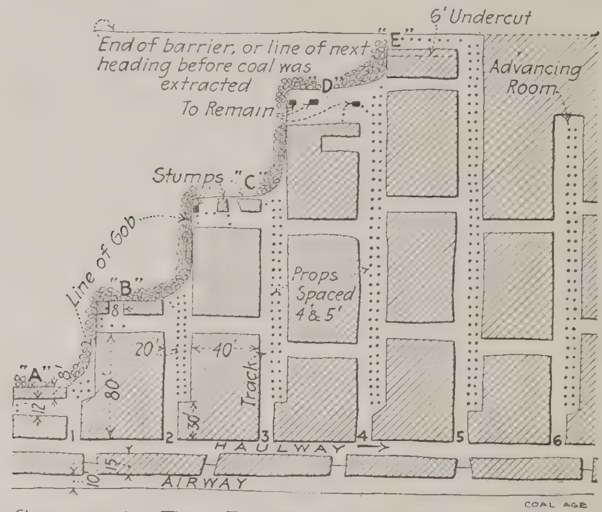
By A. W. Hesse.[*]

SYNOPSIS—The method of extraction of pillars in the Fairmont field results in a loss of about 2 per cent. of the coal, in pillars so small that they crush readily when the weight falls on them. At the same time the men are protected as far as possible from roof falls.

⁂

The method of mining coal in the Fairmont region has been already briefly described,[†] but how to keep a pillar line just right, when robbing is in progress, requires more detailed explanation than was given in that article.

All practical mining men know that the weight, which falls on the pillars when robbing commences, must be relieved by breaking the overlying strata covering the territory from which the pillars have just been extracted. Failure to do this means, of course, that the remaining stumps and ribs must carry this weight, frequently causing the coal to squeeze, and making its extraction difficult and dangerous, if the coal is recovered at all.



Sketch 1. The Fairmont Method of Pillar Drawing

Splitting Pillar Is Bad Policy

It has always been the policy of the Consolidation Coal Co. to discourage the splitting of pillars, except when all other methods were proved or considered out of the question. Such splitting usually results in the loss of one wing when the pillar is large, and frequently the loss of both followed by a squeeze over the remaining pillars if the rooms have been driven up the full length.

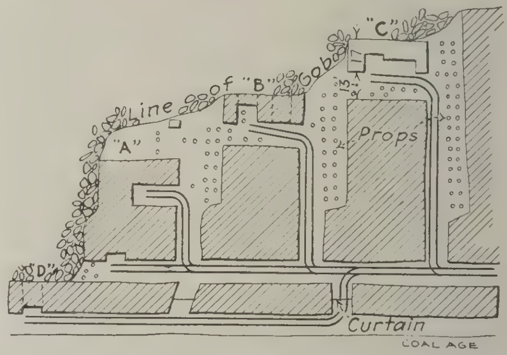
The ideal situation is to have the rooms driven up just in time to be able to return at once with the pillar. However, this is not so frequently attained as it is advocated.

The realization of this uncertainty has caused gradual widening between room centers. This gives the miner one, in fact two or three, opportunities of recovering his stumps without endangering his life or the loss of the rear pillars. If the rooms or several rooms contain falls, he may lay his track up a clear room, traverse the stumps of the rooms above, and reach the rear end of the last pillar and extract it without much fear of being cut off on the rear. He may also clean part of one room, split a stump, and thus reach the rear stump. This has been done even while the weight was causing considerable anxiety. The width of the pillars averaged 40 feet.

Where Crosscuts Are Not Favorable

Sketch No. 1 shows a series of working places on a room heading, of which five are pillars and one an advancing room. You will note at *A* a crosscut driven through the large pillar about 8 ft. back from the end. The driving of this roadway is the first step, the idea being not to expose a large block of coal to the advancing weight for too long a period of time.

The next step is shown at *B* and consists in cutting back through the 8-ft. stump to the gob, leaving to the left a square stump about 8 ft. through. This stump is then trimmed down to a size consistent with safety, usually about 3 ft., as shown at *C*.



Sketch 2. Modification of System near Original Crosscuts

Another crosscut is made in the remaining block of coal to the right, shown at *B*, leaving two stumps, as shown at *C*. The stump to the left is first trimmed down, then the track laid straight up the room and the remaining stump drawn. The finished operation usually leaves the condition as shown at *D*.

Quite frequently the drawing of the props will cause a cave at this point, but usually the next crosscut is driven before the fall occurs. At *E* where the last crosscut was driven and a barrier is left to protect the next heading, a cut or two across the rear end of the last stump gives the miner much machine coal.

Where Crosscuts Make Slab Too Thick

On Sketch No. 2 is shown a condition at *C*, which may occur due to a previously driven crosscut. This stump is 17 ft. thick, but still too thin to permit another crosscut to be driven through it. Therefore a slab is taken out for a width of 28 ft. before a cut-through is made to the rear as heretofore shown. This condition necessarily requires more timbering, which, if neglected, might cause considerable trouble, because a fall might prevent the complete recovery of the remaining coal of this stump.

If this system is consistently followed there is little doubt but that the recovery will be large, though a "slip-od" foreman will ruin a mine in a short time if he s not give it the attention it deserves day after day. e work requires considerable attention and often makes cost per ton high, especially if roof conditions are r much water has to be drained and slate-handling ilities are unfavorable. It frequently reaches that ximum value where the function, recovery, becomes re important than the real object of mining coal, king a profit.

---

⁂

Friction Rail Brake

The friction rail brake is a device for restraining the tion of railroad cars under tipples. The grade is ar-nged so as to assure forward motion at all times under vity and the necessary restraint is obtained by use of friction rail brake.

Usually a third rail is spiked in the center of the track, ighing from 40 lb. to 110 lb., no fishplates being used the joints. On this rail the brake or clamp travels car-ng a hook to which is attached a chain by which the is "tethered." Motion is permitted or restrained by raising or lowering, respectively, of a lever formed at short-arm end into an eccentric from which the clutch-g power of the shoe on the rail is obtained. It is also ed with a ratchet arrangement which works automati-ly when the clutch is applied rendering any sudden accidental releasing of the brake impossible.

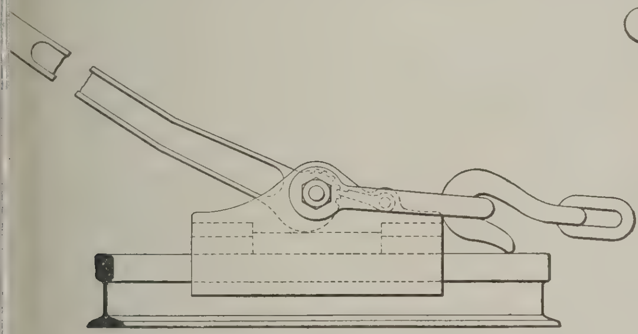

Fig. 1. Car Brake Working on Third Rail

The action of the clutch upon the rail is so positive that will stop a loaded car in motion, dead still at the will the man handling the lever and will break a ¾-in. in before slipping if the load is sufficiently heavy.

When the lever is thrown over toward the hook the entric is entirely released and the brake block can be rried or pushed back on the rail ready for another car.

Another form of brake is made suitable for use on an linary track in connection with patented fishplates. th types of rail brakes are made by the Miller Supply ., of Huntingdon, W. Va. These retarders are more iable than car brakes on a damp day or a steep grade.

⁂

New Development of American Mining Congress

The Committee on Ways and Means of the American ning Congress, W. T. Griffith, chairman, reported at recent Philadelphia session as follows and the sug-stions were accepted by the unanimous vote of the mem-rs:

The Committee on Ways and Means recommend that an ditional class of members, to be known as subscribing members, be created in this congress, which shall consist of corporations only and who shall have no right to vote; that the portion of funds to be raised from any state may be apportioned by the Ways and Means Committee for that state among all the mining corporations in the state in approximately such proportion as the value of the mining products of any corporation bears to the value of the total mining products of the state; that these subscribing members, in consideration of their subscriptions to the congress, shall have the right to receive all the publications, papers and other printed data of this congress and shall also have the right to request, from time to time, such information of a legislative and statistical nature, referring to mining questions, as the secretary may be able to supply from the records of the congress and it is further recommended that the secretary shall employ the necessary assistance to compile such data and to publish a bi-monthly bulletin which shall contain abstracts of pending legislation, opinions and other information of interest to the mining congress and this work be considered one of the important functions of the congress; that the Ways and Means Committee for each state as above mentioned shall consist of three members to be appointed yearly by the Executive Committee of the American Mining Congress and that the assessment for each state to be raised by these state committees shall, in the discretion of the Board of Directors, be approximately such a proportion of the total budget as the value of the mining products of each state bears to the value of the total mining products of the United States.

The smallness of the general apportionment and the lightness of the burden of any state or corporation under this scheme can be immediately seen by the record of the output prepared by the Government in which the total valuation of all products of the mines of this country are for the year 1911 in excess of two billion dollars. The total amount to be raised, we should suggest as a start, should be fifty thousand dollars, which is a small amount to provide for the proposed increased activities of the congress and this would show that for each million dollar output we are only asking for twenty-five dollars.

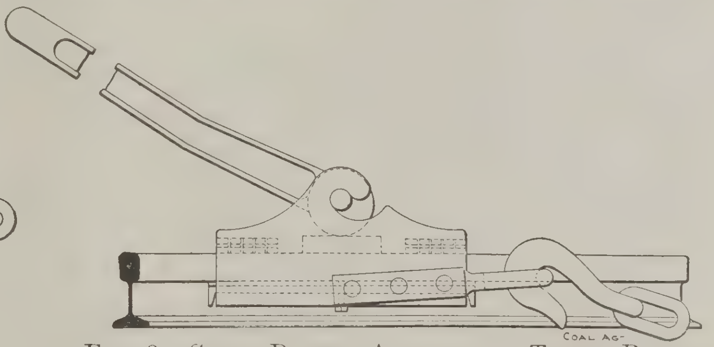

Fig. 2. Same Device Adapted to Track Rails

⁂

West Virginia's Coal Production for 1912

The production of coal in West Virginia in 1912 reached a total of 66,786,687 short tons, valued at the mines at $62,792,234, according to the figures compiled by E. W. Parker, of the U. S. Geological Survey.

West Virginia is a vast coal field, all of the state west of the escarpment of the Allegheny Mountains being in the coal-bearing formation, the actual coal-producing area embracing 17,000 sq.m. out of a total of 24,022 sq.m. in the entire state.

All West Virginia coals are bituminous or semi-bituminous, and mostly high grade. Some cannel coal and a peculiar type known as "splint" is mined in the southern part of the state. The production for 1912 marked the maximum record. It was nearly as much as the total output of bituminous coal in the whole United States in 1882 and exceeded the total production of both anthracite and bituminous coal for the year 1877.

Cost of a 50-Coke-Oven Plant

SYNOPSIS—We give below the estimated cost of 50 beehive coke ovens. This estimate was made a few years ago by a well known authority on coke ovens for a mining operation in Tennessee. It was made in detail and is given as it was made. It is valuable to anyone contemplating the erection of beehive ovens, as well as to those who desire to make a comparison with any other plant.

⁂

Excavating, tamping and filling	$3750.00
80,000 crown and lining brick, $24.00	4320.00
6,250 tile, 12 in. x 12 in. x 3 in. at $0.10	625,00
50 sets arches at $2.75	137.50
50 sets jambs, $2.75	137.50
100 rings, $1.80	180.00
75 tons fire clay, $3.00	225.00
2500 bbl. lime, $0.10	250.00
340 tons sand, $1.00	340.00
15,000 lb. coke oven door frames, $0.02½	375.00
50 coke oven valves, $0.75	37.50
50 pcs. in. x 18 in. pipe, $0.15	7.50
20 tons cast iron bowl pipe, 4 in. dia.	500.00
50 saddles for 4-in. bowl pipe 1-in. opening	75.00
50 coke ovens (labor)	1250.00
1600 yd. stone in place, $3.75	6000.00
30 tons railroad steel	900.00
500 railroad ties	125.00
33,000 lb. metal ties, $0.02½	825.00
1300 spikes, $0.02½	32.50
Total cost	$20,092.50

STEAM PLANT

1 125-hp. boiler	$1400.00
1 pump 10 x 5 x 18	200.00
1 injector	16.00
1 feedwater heater	300.00
Pipe and fittings	150.00
Engine and foundation	1200.00
Boiler and engine house	200.00
3 tanks	450.00
Total cost	$3916.00

SEPARATING PLANT

Bins	
50,000 ft. lumber at $18.00	$900.00
Doors and windows	13.00
Bolts and washers	200.00
Foundations	350.00
1 rotary screen for coal	1000.00
1 rotary screen for coke	750.00
Elevators coal	500.00
Elevators coke	500.00
Crushers coal	750.00
Crushers coke	750.00
Total Cost	$5713.00

STORAGE BINS

Storage bin	$200.00
Robinson washer, complete	15,000.00

HOUSES, STORE, ETC.

25 houses at $350.00	6250.00
1 house	750.00
1 store building complete with fixtures	1000.00
1 barn	300.00
1 tool house	100.00
Total cost	$8400.00
Laboratory	
Building	$200.00
Fixtures	600.00
Total cost	$800.00

EQUIPMENT

7 head live-stock, $150.00	$1050.00
2 larries, $325.00	650.00
1 tool box	10.00
2 stoves	10.00
12 leveling, $1.00 bars	12.00
2 levelling scrapers, $5.00	10.00
2 levelling barrows, $7.50	15.00
10 coke barrows, $9.00	90.00
10 sets hose, $5.00	50.00
20 scrapers, $3.50	70.00
1 railroad truck	25.00
10 running boards, $1.00	10.00
12 ladders, $0.75	9.00
1 drill press	50.00
1 pipe dies	90.00
1 steel stamp	2.50
1 set steel figures	2.50
1 carpenters vise	5.00
1 blacksmith combination vise	15.00
1 set branding irons	1.00
1 anvil	25.00
1 screw plate and dies	15.00
1 pair platform scales	40.00
1 100-ton railroad scales in place	950.00
1 Grindstone	10.00
50 grain sacks	9.00
2 carts	40.00
1 wagon	40.00
1 pump	450.00
Add 5 per cent	187.00
Total cost	$3943.80

Tools	
1 ax	$1.0
1 bar (spike)	1.0
1 bar (crow)	1.5
3 bars (pinch), $5.00	15.0
4 buckets, $0.40	1.6
2 brooms, $0.35	0.7
1 basket (feed)	0.5
6 brushes, $0.50	3.0
1 cold cutter	0.5
2 cars (oil), $1.00	2.0
2 chisels (cold), $0.50	1.0
1 cutter (H)	0.5
6 curry combs, $0.25	1.5
2 fullers, $0.50	1.0
2 flatteners, $0.50	1.0
6 files, $0.25	1.5
1 flue expander	15.0
2 hammers, set, $0.50	1.0
4 heading tools, $0.50	2.0
1 hatchet	0.5
3 hoes, $0.40	1.2
1 hoe (mason)	0.7
2 hammers (spike), $1.50	3.0
3 hammers, $0.75	2.2
2 hay forks, $0.75	1.5
1 jack (hoisting)	9.
1 jack (curving)	20
3 lanterns, $0.75	2
2 oilers, $0.50	1
2 picks (clay), $0.75	1
2 picks (RR), $0.75	1.
3 punches, $0.50	1.
6 padlocks	9
1 riveting machine	5
2 saws	2.
2 spirit levels, $2.00	4
1 square	1
1 set shoeing tools	5
2 swedges, $0.50	1.
6 shovels (coal), $0.75	4.
2 shovels (RR), $0.75	1.
1 sledge	0.
2 shovels long handle, $0.75	1
2 shovels scoop, $1.00	2.
1 syringe	0
1 pr. shears	1.
6 pr. tongs, $1.50	9
1 track gauge	3.
5 wrenches, (S), $0.75	3.
4 wrenches monkey, $0.75	3.
3 wrenches box, $0.75	2.
1 wagon jack	5
Total cost	$167.

RECAPITULATION OF COKE-OVEN ESTIMATE

50 coke ovens, bee hive type	$20,092
Steam plant	3916
Separating plant	5713
Storage bins	200.
Washing plant	15,000.
Houses, store, etc.	8400
Laboratory	800
Equipment	3943
Tools	167
Grand Total	$58,232.

⁂

State Mine in Victoria, Australia

The province of Victoria has a state mine at Wonthagg which reports a profit of nearly $50,000 last year. I gross output was 470,261 tons for the 12 months a the daily tonnage was about 1800 tons. Only 454,42 tons were shipped to market, the rest being used by th miners and the power house.

The mining rate is 66.6c. per ton. This was fixed after a strike lasting from Apr. 4 to May 17. The me had demanded that the three-shift schedule be changed t two and in return the manager sought a reduction in th mining contract from 73 to 66.6c. per ton. Eventuall the men conceded this reduction. The average wag earned per day under the new contract is $3.29.

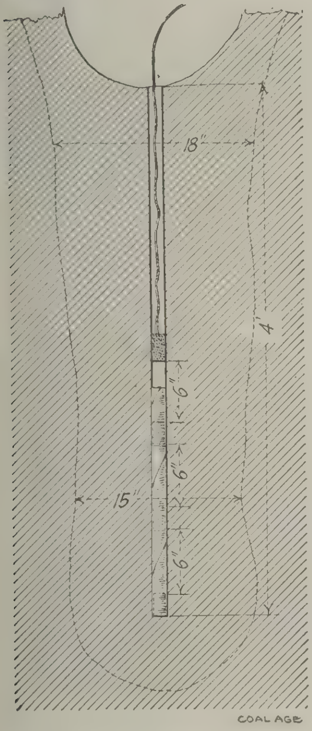
It is estimated that the coal area exploited by th Wonthaggi mine contains 26½ million tons. The are covered is 5100 acres. The plant uses electricity for hoisting, haulage, ventilation, coal cutting and pumping.

The equipment consists partly of engine-driven generating sets producing 3-phase alternating current at 520 volts and a frequency of 50 cycles. This is supplemente by Curtis turbo-alternators generating 530 kw. with exhaust and 1000 kw. with high-pressure steam.

The value of the plant is about $800,000 so the profi last year was over 6 per cent.

Blasting Pole Holes

The holes made for telephone and other poles can be blasted by electricity according to Vandeventer and Warren, telephone engineers, writing in the *Dupont Magazine.* The holes should be 4 ft. deep for a 20-ft. pole to 7 ft. for a 50-ft. The average hole is 4½ to 5 ft. deep. Poles are set for telephone service 150 to 175 ft. apart with an average of 35 to the mile. The holes have a diameter varying from 14 to 18 in. The cost of digging holes for 25-ft. poles by post-hole diggers is about 58c. each.



Arrangement of Cartridges

When blasting the holes by dynamite, the explosive should be distributed in the hole, as a charge at the bottom only, does not open the hole at the surface. A 4-ft. punch bar can be used for making the cartridge hole. It can be driven into place with a sledge and if knocked sidewise when driving can be removed without difficulty.

The Dynamite Should Be Divided into Short Cartridges

As the dynamite must be distributed, much time can be saved by making up cartridges of paper, 4 ft. 6 in. long, by rolling stiff wrapping paper round a stick of proper diameter and fastening four quarter sticks of 40 per cent. dynamite about 6 in. apart beginning at the bottom, as shown in the figure.

These small cartridges can be kept in place by the use of ordinary housewife's pins, stuck through the walls of the paper tube. This spaces the dynamite plugs properly and leaves a free space between them, thereby insuring the firing of the lower pieces, the cap always being placd in the top piece. Without the paper tube, there is some danger of the lower pieces not exploding, especially if much loose dirt intervenes. Water does not affect the proper exploding of the lower pieces, but loose soil does. A convenient way of placing the pieces of dynamite is to have a stick with marks 1, 2, 3, 4, etc., on it, and push the pieces into the tube one at a time and pin them in place.

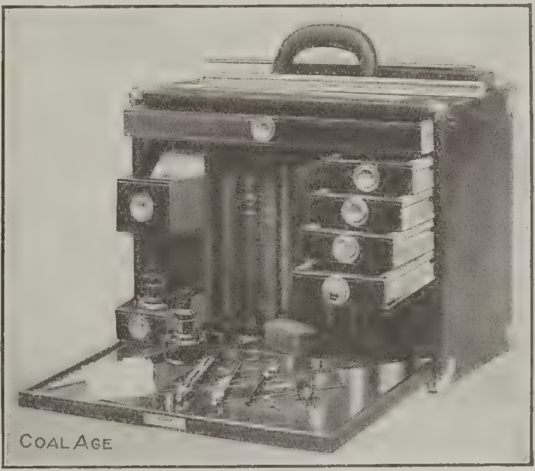
There is no need for using an electric exploder, but the use of safety matches is suggested. The fuse need project only 2 or 3 in. above the surface, and should be bent to one side. The operator is safe in staying within a few feet of the hole, when the dynamite is exploded, as there is no general upheaval of earth. An ordinary post-hole digger is desirable for removing the loose earth. No digging bars are necessary, the earth being well broken. The average time for cleaning is from 5 to 10 min. and the cost for dynamite 8½c., fuse and matches, 1c.; labor, 14c.; supervision, 3c., in all 26½c. The explosion hardens the sides of the hole and makes tamping around the pole, when set, less laborious. About 30 to 50 holes a day can be made by 5 men.

⁂

Draftsman's Chest

The draftsman's chest shown requires little explanation and is designed so as to be compact and at the same time to form a handy storage for all commonly used draftsmen's tools.

The case is covered with leatherette and the drawer fronts are solid mahogany. The top drawer is large enough to take scales, rules, etc., while the smaller drawers are used for the smaller instruments. The small drawer on the left is for a card index in connection with a vest-pocket, morocco-leather loose-leaf memorandum. The slide for ink bottles provides for three bottles and it will be noted that there is room for several reference books. The tray is the door or cover and is provided with brass cylinder locks and two keys. There is room provided back of the cover, when locked, for triangles, curves, etc., while under the drawers on the right-hand side there is provided a pigeonhole.



View of the Draftsman's Chest

This case is a recent product of the American Drafting Furniture Co., Rochester, N. Y.—*American Machinist.*

COLLIERY NOTES

The economical limit of animal haulage is reached at about 1500 feet.

⁂

An acre of coal 1 ft. thick is estimated to contain about 1800 tons. From 1200 to 1400 tons is usually minable.

⁂

Experiments are being conducted in Germany to discover the usability of liquid air and liquid oxygen as explosives for mines. The liquid oxygen is mixed with aluminum powder and detonated, producing a force 2½ times that produced by black powder. One advantage that it possesses is that no bad fumes are produced.

⁂

The Administration report on the railways of India gives the number of tons of coal mined in India during the year 1912 as 14,706,339. Of this amount 4,590,618 tons were used by the railways, while 1,325,238 tons were exported to ports outside of India. There was also imported into India 144,804 tons of coal from the United Kingdom and 415,987 tons from other countries.

Discussion of Miners' Compensation Laws*

SYNOPSIS—Full text of a most interesting and profitable discussion of compensation laws as they affect the miner and the operator, in coal mining. Description of the working of such a law, in Illinois, given by Thomas Moses, superintendent of the Bunsen Coal Co., Westville, Ill. Minor accidents previously disregarded are reported under the law. Conditions in other states—Alabama, Indiana and West Virginia discussed by mining men from those states.

⁂

THOMAS MOSES (*Illinois*)—In the passage of this law, the Illinois Legislature was much divided; the laboring people of the state were also divided. One board of organized labor was asking the legislature to pass the law, while the Federation of Chicago and the Board of Labor there were working for its defeat. Many were lobbying for the passage of the law, others for its defeat; but after a strenuous fight, the law was enacted. It was so amended that any person employing labor could elect to come under the law, or if they wished, reject it. The law was made optional with employer and employee. But any person who refused to come under the Compensation Law thereby forfeited the right to the "fellow-servant plea," or to assume risk for liability. Few coal companies, as I understand it, elected to operate under this law. Insurance companies who kept track of legislation of this nature, immediately raised their rates. The small operator became afraid to go under the law, for fear that an accident would throw him out of business. The insurance companies, as I am informed, made their rates so high, that the small operator was forced to go almost without insurance of any kind, and fight his own battles with his men and settle his liabilities as they arose.

ELECTED TO OPERATE UNDER THE LAW

The company by which I am employed, however, elected to operate under the Compensation Law, although there was much uncertainty as to the outcome. Close figures were kept on the cost and also on the accidents, which we were making strenuous efforts to reduce. We improved the equipment in the mines, to make them safe and sanitary; in fact, we put the mines in first-class condition, and adopted the slogan "Safety First" in and out of the mines. It surprised us to find that the accidents, after making these improvements, increased wonderfully. We had a greater number of accidents the first six months, under this law, than had ever been known in the mines before.

We were much concerned about this. We searched the records and found that the reason for the great increase in the number of accidents was explained by the fact that many accidents were being reported now that had never been reported or thought of before. A man would get his finger mashed, or cut a little, and he would at once go to the doctor and have it treated, which was then reported as an accident, and he was paid compensation, if he was off duty the required length of time. The law requires a man to be off nine (9) days before he is entitled to receive compensation, and then he gets one-half of his average earnings in the past. If he is killed, I do not recall the exact percentage to be paid, but the minimum amount is $1500 and the maximum $3500. The difference is gaged by the number of dependents and the earnings of the deceased before his death.

We found that when there was no claim for liability, a man who mashed a finger, or had a chunk of coal fall on his toe, or had a similar slight accident said nothing about it, as a rule, but went on with his work. But, under the compensation law, he would wait till perfectly well before he would return to work. The majority of miners (it proved so in our case) belong to the Mutual Mine Workers Benefit Association, and get a sick benefit of about $5 a week, for a certain number of weeks. Nearly all of them belong to one, two or even three sick benefits; so that the average miner, when he is getting half wages from the company and his sick benefits besides, can make more money than if he was working. That is one thing that helped to increase the number of accident reports.

EFFECT ON LITIGATION

I would draw attention to one point in the law that must be carefully guarded against, wherever such a law is enacted. It is as necessary to prevent the miner who is a rascal from cheating his employer, as it is to prevent the rascally operator from cheating his employees. We have had three law suits under this Compensation Law. The facts to be proven in court, in these cases, are, first, that the injury actually exists, and, second, the extent of the injury. How it happened does not enter into the trial; it makes no difference how it happened, the employer must pay for the injury. The extent of the injury may sometimes be questioned; as it often happens miners claim to be hurt when they are not hurt. I will mention one case.

The day after New Year day a miner in our employ came to the mine a little the worse for wear, and went to work in an entry. About 10 o'clock he went out sick. Some two or three weeks after this he made application for compensation, claiming that he was injured on that morning. I called the man to the office and asked him how he was injured. "Well," he said, "I went into the entry and the air was bad; it was full of blackdamp and I was overcome; it so poisoned my system that I was unable to work any more." I then called in the boss and others who had charge in the mine and they stated at once that in that particular part of the mine there was no question about good air. We investigated and found this to be a fact. We found that on the day this man claimed to have been overcome by bad air, the man in the next entry had worked all day, loaded ten tons of coal and drilled a hole and said he felt no effects whatever. The miner, however, pressed his claim, which I refused to pay, and we went into court.

The court adjustment is as follows: The complainant selects a man, and the company selects another, then the county court selects a third man, and a trial is held before this commission. But here is the weak point in the law. When the complainant selects his man, he is going to select one who is friendly to him; and the company, likewise, selects a man friendly to them; and the county court man is the only unbiased man. It appears to me therefore that he would be sufficient alone to try the case. We tried the case, however, subpoened every man who worked in that part of the mine or had any business there, as a witness, and their testimony was all about the same, with the result that the commission threw the case out of court.

---

*From the published Proceedings of the sixth annual meeting of the Mine Inspectors' Institute, U. S. A., held at Birmingham, Ala., June 10-13, 1913.

We have had three suits, in all, of this same nature. There is no question but that we will be held up by some of the men; but I must say, we have been given a fair deal. For 11 years previous to the time we started under the Compensation Law there never was a case of litigation that went to a jury but that the claimant got a verdict. A coal company never won a case in that county, for ten years. Of course, some cases were thrown out of court; but if it went to the jury, almost in every instance a verdict was returned in favor of the injured person. Since the Compensation Law went into effect, we have had three law suits and won all three; because it seems to have changed the sentiment toward the coal companies.

Men Report Violations of Law

Another thing: The men, in their daily work, don't hesitate to report one another when working in dangerous conditions; and they don't hesitate to stand up and tell just how an accident occurred. Previous to that, when a man was hurt or killed, the boss and all the witnesses were summoned; and if they happened to be foreign-speaking men, they immediately could not talk. Then, we had to get an interpreter, and he told the men just what to say and what not to say. Now, they can all talk at an inquest, and there is no trouble in getting them to tell the truth. Formerly, when an accident happened the boss would try to cover up the facts, if he was the least bit to blame. It was hard to get at the truth, under the old system; but now it is no trouble to find out exactly how an accident happened. We have a good fellow feeling among our men, which I think the Compensation Law is bringing about.

Two weeks ago I was invited to the local of one of our mines, when they had some matters to be brought up for discussion. I went and the proposition was made to me: "Mr. Moses, we are interested in your campaign for safety; we believe that you are honestly trying to do all you can for our protection. We visit back and forward a good deal during the day, and we want to make you this kind of a proposition: That every time we see one of our men working in danger we will report it to the boss, if you will agree to compensate us for the time that it takes. We ask this because we don't want to be regarded as carrying tales to the boss; if you give us the right to report to the boss and he does not recognize and remedy the danger, then we will report to you." Such a condition is only possible since the Compensation Law went into effect; if one had thought of making such a proposition before, he would have been thrown out of the window.

We have heard here, again, as we have heard at other sessions, that we do not have in the mines today the practical miner that we had some 30 years ago; coal is not dug today in the manner it was 30 years ago. We had, in our mines, in this country, then, a majority composed of English, Irish, Scotch, Welsh and German miners; and we wonder where these practical miners have gone. We recall that the doctors 30 years ago were not as good as the doctors of today; the lawyers 30 years ago were not equal to the lawyers of today; the merchants 30 years ago are not to be compared with the merchants of today. Advance has been made in every occupation, either professional or industrial, with the exception of coal mining; and we all admit that the miner today is not as good as the miner 30 years ago. Now, there is a reason for that; and the reason, in my opinion, is that the father has seen that he has no future in the coal mine; the battle was too hard against him and he naturally advised his sons to go into some other business, where the chances for advancement would be better. The sons have followed the advice of the father and taken up other lines of work.

Whenever we create in our mines a condition unfair to our employees, they will migrate into other callings. We must take them into consideration; we should be forced to do it, whether we want to or not. We should be compelled to provide for them in case of accident, and provide for their dependents, in case of death. The law should compel us to furnish first-class equipment for every mine, and to care for those injured by accident. When this is done, we will see the standard of practical miners grow, as we have seen the standard of every other occupation grow.

Now, I am not going to take up more time, because there are many angles and I cannot touch on them all; but I will be glad to answer any questions that I am able to answer regarding our experience with this matter. I will say this, however, we do not regard the Compensation Law of Illinois as perfect—far from it; but it is a step in the right direction—it is on the statutes and will never come off; and what is more, it is bound to be placed on the statute books of every coal-mining state. The thing for us all to do is to get busy and find out what is the best law. The principle is just and fair. There can be no question but that the operator is rightly obligated to pay what the coal miner has the right to claim; and the price of coal to the consumer must cover the cost of accidents as well as the cost of production. If it costs a human life to dig 300,000 tons of coal, should we not sell that coal with a view of compensating as far as possible for that loss of life? If we can mine 500,000 tons per life lost, so much the better; but the present death rate is 300,000 tons.

About two weeks ago I was called to Chicago where a number of men (employers and employees) were trying to eliminate some of the objectionable features of the Compensation Law. I am not a lawyer, but I want to state that there are some honest men working hard to overcome the dangers that stand in its way. The law at present meets opposition from the insurance companies, because it considerably reduces their business. It meets opposition from the lawyers for the same reason. Every dollar paid in compensation for injury or death goes to the man injured, or to his dependents if he is killed. The lawyer does not get it and the courts do not get it. They have never been entitled to one cent of that compensation.

Effect of Law to Raise the Standard of Mining

Mr. Bolt (*Illinois*)—I would like to ask Mr. Moses whether or not the operation of the Compensation Law in Illinois has had a tendency to raise the standard of the men employed in the mines; and what bearing it will have upon the education of future generations of men employed in the mines.

Mr. Moses—I think it will have the effect that when a person is injured at a coal mine he will not be burdened with the thought that those dependent on him will have to suffer for lack of support. With the knowledge that in case of accident the necessities of life will be provided for those dependent on him, I believe the tendency will be to uplift the men who work in the mines.

Mr. Bolt—But, to what extent will the amount paid as compensation benefit the family in an educational way. My father was a coal miner and his children were all educated in the coal mines. During his life time he had several serious accidents; and the only compensation received came from his immediate family. Of course, the only persons who suffered through his injury were himself and his immediate family. What I wanted Mr. Moses to explain or bring out was the fact that the real and lasting benefits to be derived from the adoption of a compensation law will be the education of future generations of mine workers. It will prove a greater benefit to the children of the injured parent, rather than to the parent himself, and, for that reason I claim that by the adoption of such a law throughout the United States, whereby employees will be compensated for injuries and their dependents, in case of death, the people who are going to be especially benefitted by that law will be the future generations, because they will be provided with food, clothing and shelter and, above all, a common school education.

The coal companies of this country as a whole ought to stand for higher education in the mines, first, last and always; and I believe, if they will do this, the day will come (it is not now, and we may not even live to see it) when coal operators will thank every person who had anything to do with the uplift movement and improving the condition of those in their employ. When we make a man a thinking man, a man capable of looking after his own interests, we create a man who will look after the interest of his employer, and this will foster a spirit of fairness. For that reason I believe (and I think you will agree with me) that the adoption of a compensation law—a comprehensive and sanely-worded compensation law—in all of the states is going to elevate by educating those who will be our miners in the future.

Mr. Moses—I heartily agree with Mr. Bolt in all he has said, and will say further that the compensation law is intended to relieve distress and if you relieve distress, you are going to elevate the condition of the people you relieve.

T. C. I. Plan in Alabama

Mr. Flynn (*Alabama*)—While Alabama has no compensation law, our company has been operating, for the third year now, under what is known as a voluntary-relief plan. That plan is similar, in fact almost identical, with the one Mr. Moses has just explained; and what is law in Illinois, is the adopted policy of my company in Alabama. I do not fully agree with Mr. Bolt; I believe that the Compensation Law *will* assist to educate the present generation of miners. As I said last evening, in my opinion, 80 per cent. of the safety in coal mines depends on the education of mining men. I can say for Alabama, the state where I have the most knowledge of mining conditions, and the most intimate experience in mining operations, that when you put on the statute books a law requiring coal operators to compensate their employees for accidents, you can rest assured that the companies will get busy; because it is cheaper to educate men to exercise due care than to pay for accidents.

Our company is carrying on a thorough system of education. We have men who constantly visit every mine employee. Experienced and practical men are employed continually to see that a miner does nothing that is unsafe. It is their duty to explain to the miners the practical and safe way. We are educating the present generation of miners up to a higher standard of realizing the dangers to which they are subject in their daily occupation.

Mr. Moses' statement that miners are deteriorating fast may be true enough, because parents are not taking their boys into the mines as they did years ago; and for the further reason that, in the earlier history of this country, coal mining was the only practical trade open to miners that came to this country from Europe. They had been coal miners themselves; this was a new country; coal mines were just being opened up; and, for that reason, they naturally went into the mines. Labor conditions here were not so crowded as in the countries from which they came. Over there, all of the industries were practically crowded; there was all the labor wanted for any kind of industry. That is not the case in this country, especially in Alabama. There has been a scarcity of labor for a number of years; and today some six or eight thousand men can find employment if desired. The rapid development of our coal mines has started other industries, and blast furnaces, steel plants, rolling mills and railroads have been built all over this country. These numerous industries have taken many of the younger generation from the mines, which explains why they have gradually drifted into other occupations.

I remember my father was a blacksmith by trade, but his eyesight became affected by constantly looking into the bright light and he had to give up his trade and go into the mines. Like 90 per cent. of other workers, he took his boys with him, as soon as they were old enough to go. But my father was very solicitous for the safety of his boys, more so than for himself; and the very fact that he had his own flesh and blood in the mines with him made him a much more careful employee than if he had had no responsibility other than looking after himself. But to return to the system of education and the voluntary-relief plan, aside from the human side of the question there is also a moral side. The human side would be considered on account of sentiment, but I have always contended that all the wealth of the world will not compensate for the loss of one human life.

To my mind, the Compensation Act will do much to educate the miners up to a higher standard, and they will protect themselves and prevent accidents, by teaching caution; because the company will soon only employ men with a practical education. I believe there are in the coal mines of the Tennessee Coal, Iron & Railroad Co. as many practical miners today as 30 years ago, notwithstanding the fact that they have,as laborers, mostly non-English-speaking men. Today 40 or 50 per cent. of the miners are negroes, and only about 20 per cent. are non-English-speaking foreigners from southern Europe—

English, Irish, Welsh, Scotch, etc. That class of labor is not coming to Alabama now, in such numbers as formerly. The contention is that the condition of miners in Europe now is better than in America; and they are more contented and less inclined to leave their native country. I think this is true, but if we have this class of labor we must educate them, and our company has succeeded in educating them up to a point that they exercise due care in regard to their own safety.

We have many accidents from absolute carelessness; we will always have them. We all get careless, at times; we work under dangerous conditions. I always tell the miners when I am going around the mines that I am never afraid of a man getting hurt in a place that he things is dangerous. It is the coal that the miner thinks will not fall, that catches him. I often say, in talking to the miners: You can gamble on making it 7 or 11; you can gamble on throwing nine; but you cannot afford to stake your life against a piece of rock or coal not falling; because when you lose your life you have lost all. If you want to gamble, then gamble on something less valuable than your life. As I said last night, I believe if the inspectors and mine officials would exercise all of their ability and use all the time at their command, to insist on miners doing their work in a scientific and safe manner, I believe we could cut out 50 to 75 per cent. of the accidents that occur from carelessness and negligence, or trusting to their own judgment as to the danger of rock or coal falling.

Advocates the Apprentice System

I advocate a system of apprenticeship by which to raise the standard of efficiency to that of the practical miner of other days. This system was opposed by the organization to which practically 90 per cent. of our miners belonged. The system that I believe has done more to eliminate the practical experienced miner than any other system is the apprentice system. Organized labor is bitterly opposed to what they term the "labor system," where one man takes in a helper until the helper becomes an experienced practical man. They claim every man ought to have an equal share of what he makes. I don't believe in such a theory. I believe in the apprenticeship system in coal mines; and I believe if we had a compensation act, that the miners themselves would realize that mining is a skilled trade. There is an art in mining, and it requires skill to perfect one's self, just the same in coal mining as in other trades. In all other trades they have the apprenticeship system, why not in mining?

If we had the apprentice system, the operator would be more careful in the selection of labor that he placed in his mines; he would not be willing to endanger the lives of 150 or 200 practical men for the sake of putting in some inexperienced man, who by reason of his inexperience would perform some act and cause the loss not only of his own life, but that of every man in the mine. They would be more careful in the class of labor they selected, and would educate them up to a higher standard of efficiency. We have got to have labor to operate our mines; and in order to replace the labor that is drifting away from the mines, we have got to adopt some method that will fill the mines with practical miners, who will educate their fellows to take care of their own safety. I am a firm believer in a compensation law for all classes of workers in coal mines as well as in all other trades.

Commission Appointed in Indiana

Mr. Pearce (*Indiana*)—I wish to say, for Indiana, that it is, at the present time, one of the few coal-producing states that has no compensation law; but I am glad to say that there has been a commission appointed, which met the first of this month; and there is little doubt but that this commission will recommend a compensation law that will be passed by our next legislature. I am a firm believer in a compensation law, and am convinced that if any state hopes to promote progressive legislation it must not oppose the enactment of such a law. I understand that, at the present time, the constitution of most of the states prevents the enactment of a compulsory compensaion law; but I feel sure that within the next two years, Indiana will have enacted, as nearly as possible, a model compensation law.

The statement has been made that we have not made the advance we should in the mines; or we have not today the practical miners that we had some 30 years ago. We must remember, however, that mining conditions have advanced very rapidly in 30 years. We are mining coal today with electrical machinery; and electrical equipment has been installed in our mines; and we are working under entirely different systems that were not thought of 30 years ago. I believe we have as practical men, and I might say, even more practical men in the mines today than 30 years ago. Our mines are developed on a more scientific and practical basis and a larger scale of operation, giving greater efficiency both for the operator and the miner, and producing a maximum output of coal at a minimum cost.

The West Virginia Law

Mr. Martin (*West Virginia*)—I am glad to be able to report that West Virginia is one of the states that has adopted a Workman's Compensation Law. The law, however, has been in effect less than a month and I have had no time as yet to read or consider it, and am therefore unable to say much as to its good or bad points. Nevertheless, we have it and it has come to stay. We believe that in a few years it will work out its own defects. West Virginia has had a great forward movement in respect to the safety-first idea. I believe that the compensation law, which will compel the operator to make compensation for workmen injured or killed, will have a tendency to reduce the number of fatal accidents. We can see an improvement in that direction already. Many of the companies have put on district bosses to take care of from 25 to 40 men. Previous to a year or two ago, this movement had been given very little consideration in West Virginia. The mine foreman was supposed to visit all working places, in compliance with the mine law; and in many cases he was unable to do justice, in respect to the safety of the mine. We have also been studying the question of humidity in the mines, and many companies have installed appliances to reduce the quantity of dust, by sprinkling, using a pipe line and hose. This, together with a special system of timbering, which many companies have installed, we believe, will go a long way toward reducing the death rate in the mines of the state. And so, as I said before, I am glad to say that West Virginia has enacted such a law.

POWER DEPARTMENT

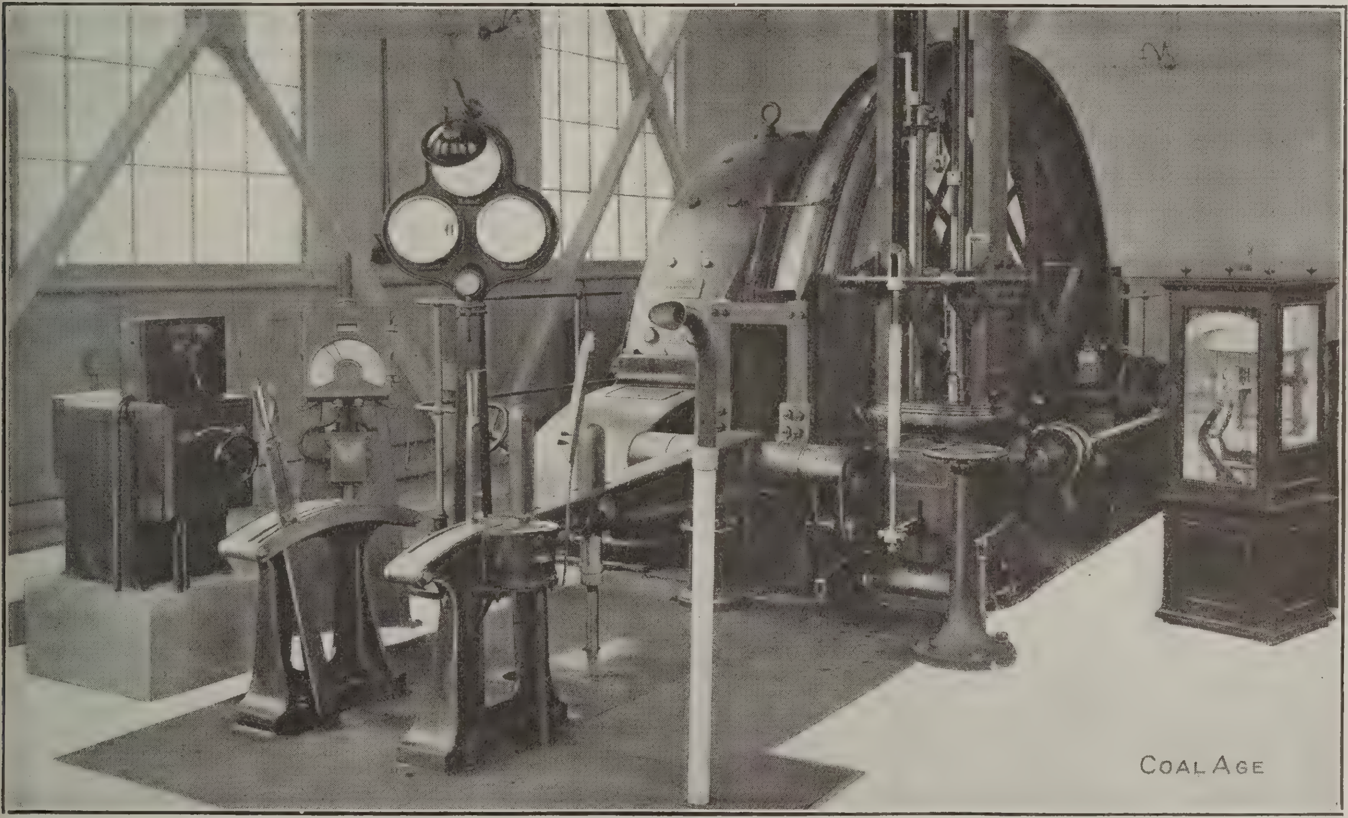
Machines for Continuous Current

By C. A. Tupper*

SYNOPSIS—The second of two articles upon this subject. It deals with motors and the precautions that should be observed to insure the successful and continuous operation of this class of machinery.

⁂

The greater number of the previous observations on the installation and operation of generators also hold good for direct-current motors, allowing for the usual differences in the size of the machines. The following, however, applies particularly to the three types of motors.



A Continuous-Current Motor Geared to a Mine Hoist

As an especial precaution to observe, do not attempt to start a shunt-wound motor until you have tested out the field circuit and made certain that it is closed. Failure to do this has caused much trouble and expense to coal-mine operators installing new motors. This test can easily be accomplished as follows:

If an automatic-release starting box is used, remove the armature lead at terminal, usually marked "Arm" at box, and carefully insulate end of cable. Then close the main switch, also starting-box lever, and note whether the release coil holds the lever in position. This coil is in series with the field and hence insures a closed circuit.

Again, with the above conditions, go to the motor and with pliers or a piece of iron note whether the poles give a strong magnetic pull. In doing so be careful not to touch the field terminal with the piece of iron, thus grounding or short-circuiting the field. As a final and third test, slowly open the main switch, and if an arc results, the field circuit is complete. Open the main switch and replace the armature wire at the starting box. If the fields are separately excited through a field switch, the above tests can more easily be made.

When connecting a motor supplied with a starting box having no voltage release, it is important that the lead from the motor be connected to terminal marked "Arm" and lead from switch to terminal marked "Line."

To start up, close the main switch and gradually cut out starting resistance until the motor runs at full speed. See that the armature oscillates in its bearings and that the oil rings are carrying oil. If speed seems excessive, check connections to see that no coil is in backwards.

If a field rheostat has been provided for increasing speed, see that all resistance is out of the circuit when starting.

The directions given for shunt-wound motors will also apply to compound machines. In case the speed is above normal, the series field is probably opposing the shunt. If sufficient starting resistance is at hand, the motor should be tried as a shunt and as a series machine. In the latter case do not attempt to get the motor up to speed. Just

Coal-Unloading Crane Driven by Continuous-Current Motor of the Mine-Locomotive Type

allow it to turn a few revolutions to see that it runs in the same direction as when running as a shunt motor. This test should be made under no-load conditions.

After testing for rotation as above, make permanent connections and start up the motor.

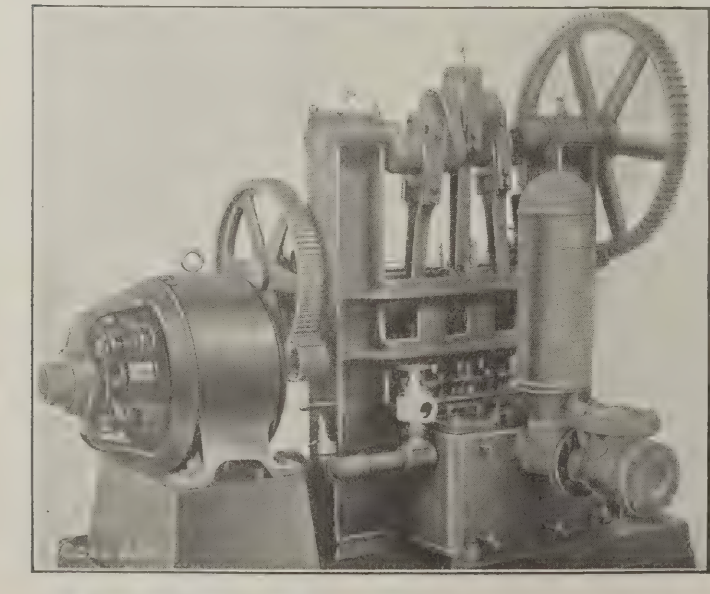
Never attempt to start a series motor without load, as it will attain a dangerous speed. On starting, gradually cut out the resistance, and on shutting down put it back into circuit.

Rules to Be Always Observed

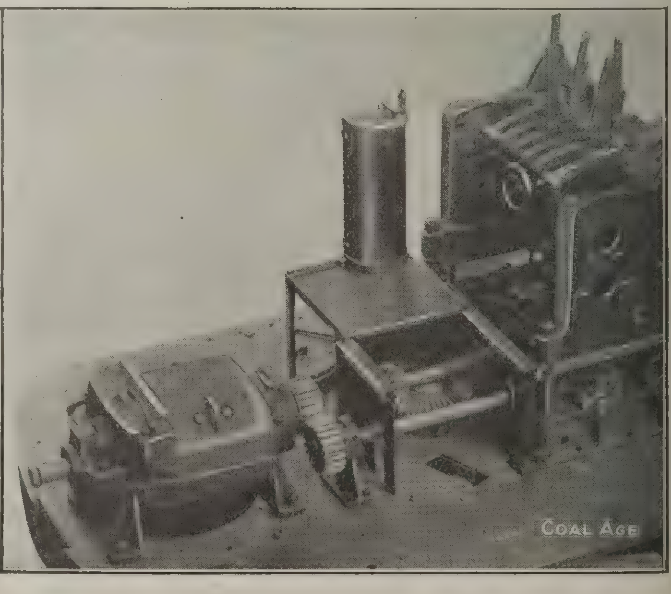
For all classes of direct-current machinery, generators and motors, there are a few simple rules which should always be observed.

In the first place, keep the commutator lubricated by using a very small quantity of vaseline applied with a cloth. If the commutator becomes rough, sandpaper moistened with oil may be used, running the machine at slow speed; or, if a piece of sandstone is available, hollow this out to fit the commutator and apply, moving it back and forth across the face of the commutator sideways until the surface becomes smooth. However, if the commutator is in bad shape, very rough, or out of true, it should be turned down. This can be done with the armature in its own bearings, using a special slide rest and running the machine slowly. After turning down the commutator, go over it carefully and remove any copper which may have lodged between the bars.

A good running commutator should present a dark, glossy appearance free from scratches. Too much attention cannot be paid to the commutator and brushes, for these are the vital parts of the machine, and their



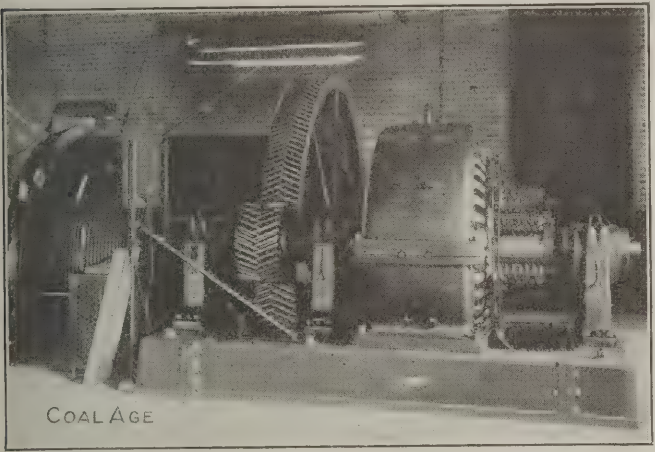
A Mine Pump Geared to a Continuous-Current Motor



Continuous-Current Motor and Controller on Coal-Dock Crane perfect or imperfect condition in a central station is strong evidence of the competency or incompetency of the attendants. There is a certain knack in caring for a commutator, easily acquired by any careful, painstaking man, and a good point to remember is that prevention, not cure, is the best remedy for commutator trouble.

If properly installed and operated, most standard machines will run practically sparkless at all capacities up to a reasonable overload. Bad sparking would, therefore, indicate improper installation, lack of attention, or in rarer cases a mechanical defect that has developed after the machine has left the factory; whatever its cause, it should be investigated at once, as sparking is destructive to both commutator and brushes.

Sparking, when first starting a machine, may result from the following: Dirty commutator, improper fitting and spacing of brushes or insufficient tension upon them. The proper adjustment of brushes and holders will effectually overcome these faults.



A Continuous-Current Motor Driving a Mine Hoist

A Direct-Current Underground Locomotive

A Direct-Current Surface Locomotive

Position of Brushes with Respect to Field

The improper setting of brushes with respect to field coils will also produce sparking. Most armatures are so wound that brushes stand on line with the center of the polepiece, when on the neutral position. The best operating position will be found from three to six bars from the neutral, forward with rotation for a generator, and backward against rotation for a motor.

The brushes can be more accurately adjusted as follows: With machine running idle at normal voltage, shift as above mentioned, until very slight sparking is noticed under the edge of the brushes. If the lead obtained, after following these instructions, is too great, causing, in the case of a motor, greatly increased speeds, or in a generator, decreased voltage, an experienced man would then advise that the brushes be set to sparkless commutation at operating load. Sparking may appear after the machine has been in operation, from developments caused by lack of attention to any of the above details, also from roughened commutator, open circuit in armature windings, or from operation at other than normal voltage and load.

With belted machines see that the armature oscillates freely in its bearings while running under load, as this will greatly lengthen the life of the commutator and bearings.

Breaking a Field Circuit

Never break a field circuit suddenly, as the inductive discharge voltage is always many times higher than the operating voltage, and may puncture the insulation of the field. A discharge resistance should be used connected to a special field switch, which is ordinarily supplied with the larger machines.

Do not open a switch on a circuit carrying a large amount of current. Trip the circuit-breaker first, then open the main switch.

See that all switches, circuit-breakers, etc., are open when the machine is not operating.

Always close the circuit-breaker first; then close the switch.

In case no protective device is used on the generator and trouble appears on the line, put all rheostat resistance in the circuit first, and then open the switch. Bearings should be given daily attention; nearly all bearing troubles are due to faults in operation rather than in design or manufacture. Some of the causes that lead to hot bearings are as follows: Poor grade of oil, grit and dust in oil well and bearings, foreign particles in oil grooves stopping circulation of oil, oil well not full, too tight or too heavy a belt, too much end thrust on armature, sprung shaft, babbitt worn down or badly cut, leaving a rough surface.

See that no bolts, nuts, screws, etc., are left around, as these may be drawn into the machine when its fields are excited and it is running. And in conclusion, upon all occasions, take care that direct-current generators or motors are kept clean, dry and free from dirt.

EDITORIALS

The Economical Combustion of Coal

In its relation to economy, the proper burning of coal for the production of power is of as great importance as its extraction from the bowels of the earth. The fuel item is one that often determines the success or failure of an industry. Hence, it is that the engineering features of modern boilerroom practice are attracting so much attention of late. The rise in the market price of coal has given fresh impetus to the investigation of the fuel question. The object sought in these investigations is to ascertain the particular features that increase the efficiency of the furnace in which the fuel is burned.

The efficiency engineer discovered some time ago that the supply of a sufficient amount of air (oxygen), per unit weight of coal burned, was not the only essential feature in the economical combustion of the fuel. He found that the element of time per unit weight of fuel burned, was also an important factor and one on which the real economy of the operation depends.

A given weight of coal burned in a given supply of air yields a known quantity of heat (B.t.u.), just as a given weight falling through a given vertical height performs a known work (ft.-lb.). But, just as the performance of a given work in a fixed time indicates the *power* employed, so the production of a given number of heat units (B.t.u.), in a fixed time, shows the energy developed and the efficiency of the combustion.

This reasoning, based on scientific knowledge, has led to important practical results. It is now well understood that, to produce the greatest efficiency in the combustion of fuel, for power purposes, the combustion must be rapid and take place at a high heat. By this means, the loss of heat from convection, conduction and radiation is reduced to a smaller percentage of the total heat developed, and the fuel itself is more completely burned.

In producing this combustion, the essential factors are: 1. To burn the coal under a high air pressure. 2. To utilize as large a percentage as possible of the heat generated by the combustion of the fuel, in the actual production of power. In the use of a high air pressure, say 4 or 5 in. of water gage, the fuel will often be blown from the grate. To avoid this difficulty, a balanced draft is necessary, which produces a differential effect, with the result that the combustion is maintained at a higher temperature and the fuel is more completely burned. Under these conditions, the furnace temperature is often extremely high—white hot.

The scheme is, after all, nothing less than an application of the old principle of a blacksmith's forge and a "hollow fire." The increased supply of cxygen produces a rapid and complete burning of the fuel at a high temperature. The heat of the combustion is greatly conserved by the type of furnace known as the "dutch-oven arch." To produce the best results, the air blast must be evenly distributed throughout the fuel bed.

A recent inspection of some steam plants, located in the vicinity of old culm piles and refuse-fuel heaps, reveals the fact that many of these plants are burning this refuse of earlier times, successfully. Such refuse now forms the chief fuel supply of many coal-mining plants where, formerly, the marketable sizes of coal were used. Such has been the increased market demand, in late years, for the smaller sizes of coal, for the production of power, that many coal-mining plants now depend wholly, for the production of their own power, on the refuse "dirt" of former years.

In the burning of anthracite dust, mine and washery refuse, etc., however, the use of a segment grate is necessary. Preferably, the construction is such as to reduce the air space to 5 per cent. of the grate area, or less. This segment grate is set in a dutch-oven furnace; and a high air pressure of 4 or 5 in. of water gage is used with a balanced draft in the furnace to prevent the fine fuel from being blown away. In the sharp competition, at the present time, it is more than ever necessary to employ every means to increase the economy of operation.

⁂

The Pneumatic Signaling System in Mines

The importance of a good signal system at shaft and slope mines has often failed to receive the attention it deserves, until some incident has occurred to reveal the inadequacy of the signal system in use. The common method formerly employed for transmitting signals between the engine room and the shaft or slope bottom, or from the mine opening to the inside workings was that by which a gong was sounded by pulling a wire, or by making an electrical connection through a wire conductor.

The defects and petty annoyances arising from these systems are numerous. Wires are broken, or false signals are given by falling material coming in contact with the wire; or by someone meddling with the wire by which the signal is transmitted. The spirit of mischief, always prevalent among irresponsible men and boys in mines, has resulted, in some instances, in serious accident due to the meddling with signal wires, which is possible in both of the old systems of signaling.

Much annoyance is also caused by the corrosion of the wires and connections. There is always the possibility, also, that the proper signal may fail of transmission at one or more points, which would prove a source of danger. Interruptions are at times caused by the freezing tight of the wires, or the short-circuiting of the electric current, at intermediate points.

The pneumatic signaling system is devoid of all these defects and possesses the further advantage that the pipe line through which the signals are transmitted can be made to serve as a speaking tube. The system permits of no interruption or meddling at intermediate points, except as the pipe line may be broken by a heavy fall. A pneumatic system of signals properly installed is practically free from any expense for maintenance, during the life of the mine. One of its chief advantages is the that it cannot get out of order through disuse; but ways ready when required, after a season of idle- . At such times, an electric system of signaling re- s much attention to again put it in shape for use. pneumatic system is also more exempt from damage ase of fire than either of the other systems of signal-

ne pneumatic system is in use in many of the mines he Lehigh Valley Coal Co., and it is stated that the aware & Hudson Coal Co. have recently decided to in- this system in their mines. The same system is in in the mines of the Oliver & Snyder Steel Co. and in umber of mines throughout the West.

⁂

he Public Coal Lands of the West

: is always a mistake to permit a misstatement of facts ccur in the defense of a good cause, one which is so red of ultimate success that only mistaken advocacy delay it. It is with this spirit that we view and re- the errors pointed out by George O. Smith and G. H. ley in the letters we print today.

nd it is strange to note when reading those letters with the peculiar vertigo which blinds and weakens controversialists, Mr. Ashley has made a misstatement ebuttal which he would doubtless be as pleased to cor- as we are to admit our own errors in fact. No hunt- musty files of governmental reports will be needed, ply a reference to our issue of Nov. 1, which was be- him when he wrote the letter in question.

Ir. Ashley quotes us as saying that the Geological Sur- sells coal lands. If he will read again carefully he light upon the word "indirectly," which he com- ely overlooked in his quotation. This adverb was not ust in without intention but with the somewhat insane a that it was necessary to prevent the subscriber and of reader from thinking for one unreflecting minute t we thought the Survey really did sell lands of any d. We could hardly believe that our readers would nk us guilty of such a misapprehension of one of the t known facts of civics, but we put the word in the tence to make assurance doubly sure.

But to show how correct the sentence is as printed when said that "Mr. Smith has indirectly the selling of the rimony of a nation"; we wish to call attention to one eresting fact. The Land Office in making its yearly ort says but little about coal-land sales except to total ir distribution, number, acreage and value since 1873, the director of the Geological Survey tells us how sales compare now with those before the year 1907 l gives the number of acres sold at each price since t date.

Of course, the Survey does not sell land, it only names price. If an individual could only do that, he could l Scranton, Pittsburgh or New York City within six nths if he made the price low enough.

In accepting the statements of Mr. Smith and Mr. hley, we must specifically object to forming an opinion the amount sold under the new *régime* until we are d how much of the coal land sold since July 1, 1907, s been classified by the department and how much has n sold before withdrawal or at prices below rates ap- aised, as is customary when lands have been filed, on before such withdrawal.

Moreover, we may be excused for wishing personally to know that the 905 sales made represent 905 conveyances to separate individuals and associations and not sales at different prices to a fewer number of such persons, actual or constructive. We are moved to make this inquiry because we find that the conveyance of the square-mile sale is not reported in the 1911-1912 report of the Geological Survey, for the land sold under any one price above $50 per acre does not amount to any such acreage. This sale was apparently entered under several separate price items, which method is not an incorrect one but such as obviously increases the number of entries, as some of them may be thereby made as low as 40 acres.

The Western coal-land question is of great interest and we expect to give it in the future more editorial space. In some matters we shall doubtless find ourselves in sympathy with the Geological Survey, though in many matters we are wholly at variance. Some of their difficulties are those of all geologists and they are merely conspicuous victims of their profession. The ascertainment of even surface-land values is an economic question of difficulty and the relation of coal value to location is of similar uncertainty. When to that problem is added all the geologic irregularities of the Western coal lands, the strain approaches the breaking point.

By putting the lands at an unsalable figure, the coal will remain in the ground so that no public officer will be condemned for giving coal land away for a questionable purpose or accused of enriching an individual at the public expense. The position of a governmental officer in these days of public scandals is not an enviable one. But the people must be served rightly even despite the threat of the muckraker. The public wealth must not be monopolized by the government merely because its officers fear that, otherwise, they might in some cases enrich an individual. Such governmental caution as we too often see resembles the fears of the miser.

⁂

Protection That Does Not Protect

The developments of the past week, in Scranton, remind one of a game of hide and seek. We refer to the peculiar situation growing out of the recent investigations undertaken by the Scranton Protective Association, in the interest of property holders; and the work of the Mine Cave Commission, authorized by the Davis Mine Cave law, which passed the assembly and was signed by Governor Tener, July 28, 1913.

The question of surface support, in Scranton, has assumed the aspect of a three-cornered fight between the resident property holders, the city officials responsible for the enforcement of law and the protection of the lives of citizens, and the coal companies operating the mines underlying portions of the city.

The Mine Cave Commission has been severely criticized for its seeming inactivity during the past three months. The report made to the city council Nov. 14, however, is a vigorous arraignment of the director of public safety and incidentally, also, of the city solicitor, to whose evasive methods the commissioners ascribe the delay in the enforcement of the law. So strong was the evidence presented by the commissioners that the city fathers have now asked Director Terwilliger for an explanation of his failure to act on the reported violations of the law.

The amusing feature in the situation, which has reached a white heat, in Scranton, is the absence from the city, on a hunting expedition, of both the director of public safety and City Solicitor Davis. It might be appropriate to ask: Why are these two much needed officials more absorbed in their own pastime and enjoyment than in the faithful prosecution of the work entrusted to their care? Is the hunting of game of greater moment than the protection of the city's interests, at a time when law is being violated?

All interests are now looking forward hopefully to the coming of President Truesdale to Scranton to confer on the question so important to the business interests of the city. The Lackawanna president can be expected to evolve a scheme that will bring relief and make the people of Scranton proud of the Anthracite Road.

⁂

Effect of New Tariff Law on Coal Business

"Largely sentimental" is the way New England views the effect of the new tariff law on the coal business. The reduction of the old rate of 67c. to the 45c. imposed by the Payne-Aldrich law of 1910 was of negligible effect, and the placing of bituminous on the free list now is hardly likely to attract any materially increased tonnage from foreign ports. What foreign coal comes to New England is almost exclusively from Louisburg, Cape Breton, and while in ten years the consumption of American soft coal has steadily increased in our north Atlantic states at the rate of several hundred thousand tons a year, the receipts of provincial coals have in the main grown steadily less.

Portland and Boston are the only centers where Cape Breton coal is imported in any quantity, and in 1912 at Boston the entire tonnage received was only slightly over 300,000, or less than 7 per cent. of the total by water. The answer is that Dominion coal is relatively so inferior and withal so expensive to put on the market, that even duty-free, the outlet for it here is bound to continue narrow, and restricted to special instances.

For several years the Cape Breton coal entered at Boston has been exclusively for one of the large gas-producing companies, under an old and long-term contract, and the smaller and smaller amounts taken from Louisburg is due to the larger tonnages received each year from West Virginia. Buyers have been so liberally educated in heating values the last few years, that there is less and less interest in prices alone; there is now a broad discrimination against fuels that are high in ash or low in fusing temperature, and the differential between "poor" and "good" is each year an increasing one. On quality, then, there is little chance of any influx of provincial coal, and quality as a factor will probably more than offset the elimination of the 45c. duty.

From Great Britain, the only remaining possible source of supply, receipts of coal since 1903 have been practically nil, and doubtless they will remain so, at least under ordinary circumstances. Ocean freights, the cost of mining, and a normal market at home are of themselves sufficient to keep British shippers from ventures in this direction.

Indeed, it is not as if "free coal" were an untried experiment. Jan. 15, 1903, by special act of Congress, called forth by distress in the big cities on the Atlantic seaboard as a result of the great strike in Pennsylvania, coal was admitted free for one year, and had it not b for the attempt of the Hampton Roads agencies that s son to get an abnormally high price for their West V ginia output, there would have been much less impor coal than was the case.

On Apr. 1, 1903, the f.o.b. price of Pocahontas a New River coals was "established" at $3.35, a price 5 higher than the high season price of ten years later, a two or three of the largest corporations who refused pay it were found later with Cardiff steamers alongsi Needless to say, the Hampton Roads price soon drop to $2.50@2.60, then a normal figure. The statistics the port of Boston show that there were practically imports of British coal after May, 1903.

That episode was, of course, a special case, and Brit coals and freights have since advanced along with Am ican prices and rates, and the increasing coal traffic o seas is from here across, to points that were formerly s plied from England, and not from England here. Ame can coal, therefore, needs no more protection than nat and geographical position themselves afford, so far as c cerns our northeastern states, and "free coal" as a bo to New England is rather like a soft word—it costs v little and does no one any harm.

Of the indirect effect of the tariff on coal mini through the manufacturing industries, there are differe opinions. It may be there will be a halt to the expansi that has gone on so fast during the past decade or t but it is hardly expected that the consumption of bitu inous, in the aggregate, will decrease.

There is caution now in most directions, particula among textile people, but once adjusted to the new sche ules and policies and with the money market more s tled, there is small reason for thinking 1914 will be a but a flourishing year for soft coal in the United Stat It is only indirectly that any slump is likely to come, a representative opinion does not countenance such a p sibility. Certainly on neither ground, inroads by forei shippers nor through industrial depression, is there lia to be any serious upset in the present course of the c business in New England or elsewhere.

⁂

Recent Legal Decisions

By A. L. H. Street*

Adjustment of Coal-Land Transaction—Plaintiff, havi accepted repayment of advances made by him in the pu chase of coal lands, in lieu of an interest in the lands recover which he had sued, was precluded from afterwa suing to recover an interest in the land. (United States Ci cuit Court of Appeals, Fourth Circuit; Coal & Coke Ry. C vs. Nease; 207 Federal Reporter 237.)

Liability for Demurrage—When a vessel is chartered carry a cargo of coal and is directed to report at a certa coal company's docks for loading, the charterer becomes liab for demurrage incurred because of the company's failure give customary dispatch in loading. (United States Distri Court, District of Maine; Carleton vs. Three Hundred Sixt seven Tons of Coal; 206 Federal Reporter 345.)

Duty to Instruct Inexperienced Employee—The rule of la which requires an employer to warn an inexperienced em ployee against the dangers which are incident to the work which he is assigned is not limited to minor employees, a extends to adults. (Pennsylvania Supreme Court, Zeskie v Pennsylvania Coal Co., 88 Atlantic Reporter 414.)

Duty to Furnish Miners' Props—A Kentucky mine ope ator is liable for injury to a miner resulting from failure furnish him roof props on request, as required by statut unless the danger was so imminent that a reasonably pruden miner would not have remained at work under the circum stances. (Kentucky Court of Appeals, Left Fork Coal Co. v Ownes' Administratrix, 159 Southwestern Reporter 703.)

SOCIOLOGICAL DEPARTMENT

The Use of Injectors on Breathing Apparatus

NOPSIS—Answers are given to Prof. John Cadman's rtion that injectors are dangerous in breathing ap- atus. German authorities declare that there is no und for favoring breathing appliances in which the ctor is omitted. Just as steam operates a boiler inspira- by its passage through a tapered orifice, so the oxygen ping from its cylinder draws air through the injector breathing equipment. The injector draws from the containing exhaled air and tends to cause a ht vacuum, which is increased by the absorption of bon dioxide by the potash in the alkali cartridge. If bag is punctured or its connections leak, carbon noxide may be drawn in. To avoid this, new appar- s provide that the pressure shall, in all parts of the ice, be greater than atmospheric and that the air cir- ation shall take place at increased pressure in the gs. Care to hold air in the lungs when putting on the met will also aid in preventing such unduly low ex- ation-bag pressures.

⁂

Coal Age has already published some items (Vol. 3, ge 718) about the danger alleged by Prof. John Cad- n, of Birmingham, England, to be attendant upon the of injectors with breathing apparatus. His views re- ved much attention in the papers at the International ngress on Rescue Work and Accident Prevention, held Vienna, Austria, September, 1913. It may be worth ile to present the following notes, translated from ab- acts in the "Montanistische Rundschau." The first is m a paper by Doctor Fortsmann, mining assessor and nager at the rescue-work headquarters in the Rhenish- estphalian coal-mining district:

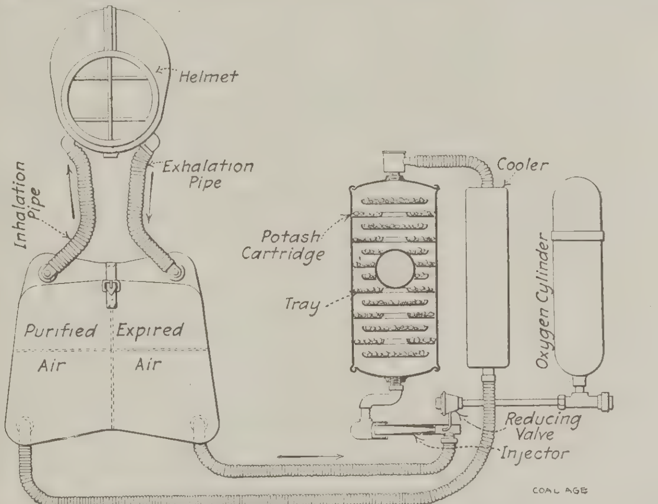
ressures Lower Than That of the Atmosphere

"Professor Cadman, of Birmingham, has, in recent ars, determined that pressures below atmospheric in eathing apparatus equipped with injectors may occur d, in case of leaks, be dangerous to the wearer. He erefore discourages the use of injectors on such ap- ratus. It has long been well known to us that such w pressures occur and are a source of some danger. evertheless, in Germany, the introduction of injectors is garded as essentially progressive, and the danger is met abundant warnings to the rescue crew of the danger of aks, together with careful tests immediately before put- ng on the apparatus. The publications by Professor adman have caused the Rhenish-Westphalian rescue eadquarters to make extensive experiments concerning e magnitude of its danger. These tests have resulted as llows:

"The degree of the low pressure occurring in breath- g apparatus varies within wide limits. It depends upon:

1. The adjustment of the blow-off valve;
2. The degree of depression produced by the automatic;
3. Whether the breathing bag is completely filled with air or not.

"The quantity of outer air entering the breathing apparatus through a leak is dependent upon these factors, as well as upon the size of the opening. With large leaks the penetrating air may become dangerous if it contain poisonous gases. Such leaks can, however, be determined even by a cursory test with the depression meter. For small leaks (through orifices of 0.08 in. diameter), the man with the depression meter can also determine, if he makes the test carefully, whether under normal conditions so much outer air does not, at least in case of great exertion, enter the breathing apparatus as to endanger the life of its wearer.



New Model of Draeger Apparatus Which Forces Air and Oxygen through Potash Cartridge. Drawing Air through the Resistant Potash Cylinder May Sometimes Cause Mine Gas to Be Sucked through Leaks

Apparatus with Injectors Is of Proved Value

"According to this, the opinion expressed against injectors is exaggerated, and there is no ground for preferring injectorless breathing apparatus, with which much less work can be accomplished."

The other paper which treats of this subject is by Mining Assessor Grahn, instructor in the mining school at Bochum, and manager of rescue work for a Westphalian mining association:

"Oxygen breathing apparatus with injectors, as in particular that of the Draeger Works, of Luebeck, the Westfalia Co., in Gelsenkirchen, and the Mining Engineering Co., Ltd., in Sheffield, England, has been used for a number of years in most mining districts and in related industries, the results generally being excellent. At the Bochum mining school, for 12 years past, all pupils and often mining officials also, have been in-

---

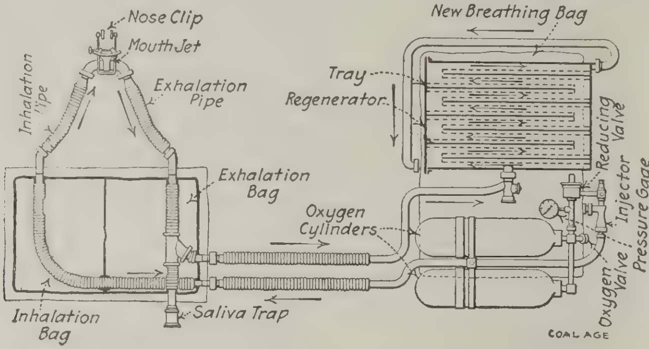
Note—Translated for "Coal Age" by E. F. Buffet.

structed in the use of breathing apparatus with injectors. For as long a time such apparatus have been kept for the use of the mines in the district in case of emergency.

"Such disasters as that in an English coal mine, at Swansea, mentioned by Professor Cadman, which was attributed to mine air containing carbon monoxide, which had been sucked into the apparatus as a result of injury to the regenerator, have not so far, to my knowledge, been observed in the Rhenish-Westphalian industrial district.

Importance of Testing

Breathing apparatus which have not been duly filled before the beginning of breathing and carefully tested for tightness and efficient working of the automatic, have indeed, in individual cases, where improperly used, led to accidents, especially to carbon-monoxide poisoning.



Modification of Westfalia Apparatus with an Additional Breathing Bag Carried on Back to Avoid Pressures Lower than Atmospheric

The fact determined by Professor Cadman that low pressures occur in injector breathing apparatus and, if leaks be present, may admit air from outside, is correct and has been observed since this apparatus has been in use.

According to my determinations, the depth of depression can amount under especially favorable conditions, to 3.2 in. of the water column.

What quantities of outside air may be sucked into breathing apparatus through leaks of determined size under certain conditions, is a subject extensively investigated by Doctor Forstmann, in Essen, and more fully reported in his address. According to this, it appears almost impossible that the rescue man can be endangered in gases of combustion with an ordinary carbon-monoxide content of not more than 1 per cent., when the cross-section of the leak does not exceed 3 or 4 sq.mm. (0.0047 to 0.0062 sq.in.).

Pressure Provided Equal to or Greater Than Atmospheric

To meet objections that have been raised in many quarters on the ground of the foregoing facts, the firms named which manufacture breathing apparatus are making, where desired, the following changes or improvements:

(a) The Draeger Works, in Luebeck, let the injector on its 1910-1911 model blow the exhaled air through the regenerator instead of arranging it so as to suck the expired air through as formerly.

(b) The Westfalia Co. and the Mining Engineering Co. furnish with the previous 1912 model, a second large breathing bag to be carried on the back and c nected in the circuit of the air behind the regenerat The bag is furnished inside with weak rubber bands that it contracts as soon as the ordinary pressure in apparatus falls. The relief valve of the exhalation bag set so as to blow off at a higher pressure than befo namely, 4 in. water column. Of the alterations just m tioned, I have hitherto been able to test only that of Westfalia in the trial room of the mining school.

These experiments have proved that, if the appara be properly used, these changes prevent low pressure b ter than the old plan. I have in view to make furtl tests, with the Westfalia and Draeger apparatus, an expect to report upon them to a meeting of this congre

For the use of injector breathing apparatus of the and new designs, in case of emergency, the following ru are most important to follow, hereafter as heretofore:

(a) The apparatus before using is to be subject by the well known methods to very careful testing, pecially for tightness; (b) The entire apparatus, a especially the breathing bag, must be filled with air b fore the rescue man exerts himself; (c) During use, t apparatus is to be constantly watched by the leader.

⁂

Underground First-Aid Stations

By Joseph Daniels*

The Northwestern Improvement Co., operating c mines in Montana and Washington, has taken an acti lead in adopting safety measures and appliances and organizing and training its officials and men into efficie rescue and first-aid units. Examples of some of t underground first-aid stations in the mines of the Rosl field are shown in the illustrations.

Fig. 2 shows a station at the intersection of a manw and entry in No. 5 mine. Part of the wooden stopping used for a door and the rest carries a first-aid box mou ed in a wooden frame which is illuminated by five 32- lamps. The wooden frame is 2 ft. 6 in. long, 2 ft. wi and 6 in. deep, made of inch boards and lined with asbestos back. The bottom of the box forms a shelf which may be placed any supplemental articles, such bottles of picric acid. The stoppings and the walls are all whitewashed. No man in the mine can fail to know where to go in case of emergency, and there is always sufficient light by which to work. Fig. 1 shows details of the station box.

Another form of station is shown in Fig. 3. This is cut in the coal and roof rock on the entry at the partin and is about 12 ft. long and 6 ft. high and lined with wo and then whitewashed. In addition to the first-aid bo already described, a roll of blankets carried in a close

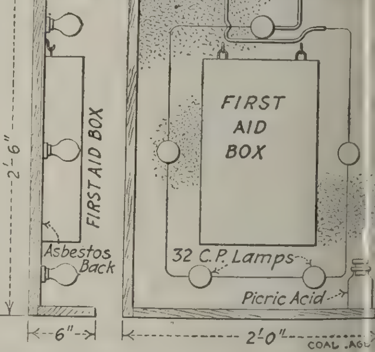


Fig. 1. Manner of Installin First-Aid Box in Roslyn Min

sheet-metal tube or frame 5 ft. long, 10 in. in diameter, is suspended on a pair of hangers. A stretcher, also carried in a metal tube which is 8 ft. long and 7 in. in diameter, is similarly carried by hooks. These metal tubes are either of galvanized or ordinary iron painted black and have a large red cross marked on them. A complete assortment of splints rests on the tubes. These stations are being installed throughout the various mines of the field.

⁂

Training for Rescue Work

The Bureau of Mines has kept in mind the fact that there is a broad gap between theory and practice, and has inaugurated a series of practical maneuvers in the mine of the Consolidation Coal Co., at Chiefton, eight miles south of Fairmont, W. Va. In this mine, the conditions of an explosion are imitated and a rescue drill is practiced.

In all, 24 teams of 5 men each will be put through their paces by the men in charge of car No. 6, now stationed at No. 72 or the Chiefton mine. One of the company tenements has been formed into a rescue station, one room being devoted to first-aid equipment and the second to helmets and pulmotors. The upstairs apartments are used as changerooms for the teams which will be trained.

Near the entrance to the mine, a smokehouse has been built for testing the apparatus in formaldehyde gas in order to find whether there are any leaks before venturing into the mine. A blind entry off the main heading directly inside the entrance has been equipped as an underground emergency hospital.

The door leading to the smoke area which is to be used in training work, is 350 to 450 ft. in, along the main haulway. The area consists of 3 rooms and 3 side entries closed off by stoppings and brattice cloth. In case the apparatus of any of the men should fail, a fan furnishing 25,000 cu.ft. of air per min. can clear out the smoke in from 3 to 5 min. Thus there is no risk accompanying these drills.

There is to be, as usual, some spectacular work. The bureau is convinced that the interest of the people, and above all that of the wives and the co-laborers of the miners and others engaged, should be aroused. Consequently electric lights have been strung in the main roadway and window sashes have been placed in the trap doors. The roads leading to the smoke area have been made clean for visitors, so that anyone can go in the mine and watch the work without having his clothes soiled.

Two teams will undergo training each week. They will be taught not only rescue work but first aid, a syllabus of 24 first-aid and 6 rescue events being provided for instruction and practice. C. O. Roberts is first-aid instructor and E. Steidle is foreman in charge of the car. The names of the companies presenting teams for training are given in our issue of Oct. 4, p. 502.

⁂

The Human Factor in Welfare Work

The success of the work of all welfare organizations, such as that at Decota, W. Va., is not so much in the elaboration of details, or even in its response to the actual needs of the people affected as in its *mutuality*. At the Y. M. C. A., built by the Carbon Coal Co. and described in our issue of Nov. 15, every effort is made to enable the employees to feel that the enterprise is their own and depends on their efforts for its proper support.

The management of the coal companies has never interfered with the association policies, but has left the entire management of its affairs in the hands of the men and the trained secretary. The company gives liberally to the support of the work and feels that it is a good investment. The men are also liberal in their patronage for they know that any surplus revenue, instead of going to the company or to the pocket of any private person, will be used by themselves in an extension of their own enterprise. The success of such an undertaking depends largely on the selection of the right person to be the leader. He must have had the training which will give him the correct perspective; he must know the value of the human personality; he must be able to sympathize with human weakness and know how to develop the best in each of his men.

⁂

The Colorado Fuel & Iron Co. employs a rather novel method for humidifying mine air. A radiator is placed on both sides of the heading through which the entering air passes. The waste steam from the radiator is conducted to a perforated pipe to which is attached a curtain of burlap or brattice cloth. The purpose of the burlap is to bring the condensed steam in contact with the air current. As the air pases over the radiator it is heated and its capacity to pick up moisture is greatly increased. It then strikes the saturated curtains and absorbs the moisture.

DISCUSSION BY READERS

Starting Fan after Explosion

Letter No. 8—Referring to the recent discussion of this subject, I want to say that the question of whether a fan should or should not be started, after a brief idleness because of being damaged by the explosion, is a difficult question to answer directly; because the conditions vary so much, in all accidents of this kind.

In my mining experience of 57 years, I have had much to do with gas and have witnessed many serious explosions. I was in Bryndu colliery, near Pyle, South Wales, when the explosion took place there, in 1858, that killed every man in the split of air in which it occurred. In 1862, I was at the Park Shaft colliery, Briton Ferry, South Wales, when an explosion took place that killed every man on the east side of the mine, which was ventilated by a separate air split. In 1867, I was at the Ferndale colliery, South Wales, when all the men on the east side of that mine were killed by an explosion. The two mines last mentioned were ventilated by furnaces, which were the only means of producing the circulation of air through these mines.

If we assume an explosion takes place in a gaseous mine ventilated in five or six separate splits or air currents, it may happen that this will be wholly confined to the one split in which it occurred; or, if the explosion is assisted by accumulations of dust and more or less gas distributed throughout the mine, all of the splits may be affected alike, the explosion being general. In that case, the force developed would probably be sufficient to damage the fan, which would have to be stopped for repairs. It is natural, then, to imagine that the main entries and roadways would be blocked by numerous caves or falls of roof.

Under these conditions, it is certainly a difficult problem to decide upon the best thing to be done. There are, probably, many men still living in the mine and many who have been killed by the blast or buried beneath the falls. Moreover, fires may have been started in different parts of the mine. As has been stated before, in this discussion, the fires would produce more or less circulation of air through the mine and endanger the men who are still alive, as much as would result from starting the fan. On the other hand, if no fires exist in the mine and there is no circulation of air, the accumulations of gas in the workings will endanger the men still alive and entombed therein. In a gaseous mine, there is, of course, the danger, in starting the fan after a brief idleness, of driving accumulated gas into a fire area and causing another explosion, with the possibility of a greater loss of life even than before.

In the face of these numerous difficulties, it frequently happens that good use can be made of the mine-rescue corps, wearing helmets or other breathing apparatus. It may be possible, by this means, to penetrate the inner workings and obtain information of the condition of the mine and rescue many survivors. Whenever this is possible, it is certainly the best thing to be done; but this system has not as yet, in my opinion, been fully developed and is often ineffective, except where the circumstances are peculiarly favorable.

Where the explosion in a gaseous mine has affected one split only, there is grave danger in allowing the fan to remain idle for any length of time, which would permit the accumulation of large bodies of gas in the other splits. In this case, the fan should be put in operation as quickly as possible, and steps taken to confine the circulation of air to those splits not affected by the explosion.

Lehigh Valley Coal Co.

Pittston, Penn.

⁂

The Certificate Law

Letter No. 2—The question of a universal certificate law seems to be attracting the attention of mining men to a considerable extent, at the present time. As has been suggested, an intelligent exchange of views and opinions on the question will not only be interesting, but cannot fail to secure a better adjustment of the matter.

The remark was made by Mr. Dixon, Coal Age, Oct. 25, p. 604, that it would be a wise provision if each coal-mining state would pass a law, making the holders of a duly authorized certificate of competency in another state eligible to like office in that state also. He argues that: "Such a law would encourage the interchange of intelligent mining men and * * * * * provide a means by which ambitious young men could obtain a wider experience and increase their competency."

I am of the opinion that nothing would be gained by the enactment of such a law; and that the present condition has a greater tendency to stimulate ambitious young men to study and increase their competency and gain a wider experience than the proposed change could effect.

It appears to me that it would be a difficult proposition for the different states to enact laws that would be sufficiently universal in their application to the various conditions and requirements existing in different coal fields. Some states are more progressive and further advanced in their mining laws, and require a higher degree of proficiency in candidates for the position of mine foremen than is the case in other states.

Under the present system of examination, each state maintains its own standard and coal operators do not suffer by the employment of mine foremen who have been examined and certificated by a board in another state where the requirements are not as severe. The adoption of such a universal system of certification would, I believe, tend to endanger the lives of miners by increasing the migration of irresponsible foremen of limited training and experience, and by the employment of foremen who are not fully acquainted with local conditions.

The matter of standardizing examinations in different states, as conducted by different examining boards, would be another difficult proposition. No two examining boards mark alike, and the grading of candidates in examination would depend as much on the intelligence of the examiners as upon the replies of the candidates. It should be no great burden or task for a mine foreman holding a certificate of competency in one state, to secure a like certificate in another state, if he is capable of meeting the requirements made necessary by the different conditions in the other state. On the other hand, it would be an incentive to the candidate to further study and the acquirement of greater knowledge.

It goes without saying that the examination in different states must conform to the conditions of mining and the standard of proficiency required in each case. It is also true that the mining industry is progressing, and it is necessary that the standard of examinations must advance at the same rate, in order that only capable and efficient miners be awarded certificates of competency. It does not follow that a miner who is qualified and competent to discharge the duties of mine foreman in one mining district or state is like qualified or competent to discharge the same duties in another district or state where the conditions are more complex.

It is my belief that the coal-mining industry of the country can be best promoted, and the safety of miners best conserved, by each state enacting laws regulating the mining of coal in its own territory. I believe that a certificate of competency to act as mine foreman should be good only in the state where it is granted, and that no certificate of competency should be issued for a longer period than six years.

It is too often the case that a candidate will prepare for examination by studying diligently for a few weeks previous to going before the board; and when the examination is over and the certificate granted, all further study is dropped. If, however, the candidate knew that he was required to pass another examination in a few years, again, he would keep up his study and interest, and his mining knowledge would increase. It is enough to convince any reasonable mining man of the absurdity of granting certificates of competency for an indefinite period or making those certificates good in all states, when we observe the number of mine foremen who read no mining journals or make any systematic effort to acquire more mining knowledge. There are many such foremen in all mining camps.

Having been a member of the new examining board, referred to by U. S. Wilson, Coal Age, Nov. 8, p. 710, I am familiar with the incident he narrates of a man holding a second-class or "Class B" certificate granted by a previous examining board in Tennessee, failing to pass an examination for a first-class or "Class A" certificate, or even to receive a sufficient average to entitle him to the "Class B" certificate which he already held. I want to say that the failure of that man to secure the necessary mark in the second examination before the new board was due to no fault or unfairness of either examining boards; but can be attributed to the fact that after receiving his "Class B" certificate, in the first examination, he neglected further study of the methods and systems of mining and, as a consequence, instead of advancing in knowledge and experience, he retrograded to that extent that his present knowledge and qualifications would not warrant the granting of a "Class B" certificate.

This incident is only one of many I could mention in support of my argument, that certificates of competency should be frequently renewed. I believe in a progressive system that will keep men studying methods of safety, means of sanitation and plans of producing coal, and that will stimulate them with an ambition to make better mine foremen. There is the same demand for raising the standard of competency in mining that there is in teaching school. As systems of education have changed and the required standard has been raised, so mining operations are conducted upon new and improved methods, and require a higher degree of proficiency in mine foremen than was required a few years ago.

John Rose,
District Mine Inspector.

Dayton, Tenn.

⁂

Letter No. 3—The question raised by Mr. Dixon, Coal Age, Oct. 25, p. 604, in regard to making mine-foreman certificates good in all coal-mining states, is an interesting one. It is quite true that, previous to the certificate law being enacted, a competent man could secure a position to act as mine foreman in any district or state where he might chance to go, without being required to pass an examination to prove his competency.

I do not wish to detract one iota from the importance of the certification of mine foremen, as, in my opinion, every official connected with mining, in an active capacity, should be required to pass an examination, from the mine manager down to the shotfirer. I would urge that such examinations be required in every coal-mining state. The certificates should be graded, and a percentage of efficiency required in accordance with the importance and responsibility of the position desired by the candidate.

On the other hand, while I believe in the examination of candidates for mine foremanship, in each state, it does not seem to me fair to require a man of experience to serve another apprenticeship in mining when he migrates to another state. In my opinion, the mining laws of the state should not require that a candidate for mine-foreman certificate should have a specified number of years' experience in the coal mines of that state. Where such period of apprenticeship is required by law, as in the case of the bituminous mining law of Pennsylvania (Art. 24, Sec. 4), or the coal-mining laws of Colorado (Sec. 40), the law should be so amended as to eliminate this requirement. The bituminous law of Pennsylvania requires an apprenticeship of five years and the coal-mining laws of Colorado demand a similar apprenticeship of two years, before a candidate is eligible and can be granted a certificate of competency to act as mine foreman. I believe the eligibility of a candidate should depend solely upon his competency as determined by an examination in the state where he desires to serve as mine foreman.

It cannot be denied that the different coal fields present conditions that vary widely in their requirements, in respect to the safe and economical extraction of the underlying coal. But, after all, the principles involved in the operations of mining are very much the same; and a man who has proved his competency in examination before a properly constituted examining board, should not require more than one or two years of service as assistant mine foreman, in the state, to make him eligible to the higher position of foreman.

In my opinion, Mr. Dixon's suggestion of a universal certificate of competency would have a tendency to lower the standard, not only because the holder of such a certificate would feel he could hold the same position in any state; but, because it would authorize the employment of many mine foremen under conditions with which they are totally unfamiliar. It would remove the stimulus for study and improvement. While the incident cited by Mr. Wilson, Coal Age, Nov. 8, p. 710, where mine foremen operating adjoining mines on the border line of Kentucky and Tennessee could not cross the state line and occupy the same position, presents a somewhat aggravating condition, it may prove a necessary requirement in other mines and districts of these states; and, as a law, it shoud be strictly enforced.

J. E. Ambrose.

New Durham, N. J.

⁂

Collapsible Stoppings

Letter No. 10—To speak of "collapsible stoppings," in reference to mines, is quite indefinite, and the question has well been asked: "What is a collapsible stopping?" Most of the stoppings as built at the present time may be classed under that head, as in few instances only, would they withstand the force of an explosion.

While it would certainly be an expensive proposition to build all main stoppings of a noncollapsible type, yet I am heartily in favor of building the stoppings on the main heading in a substantial manner, so that they will be capable of withstanding the shock due to an ordinary local explosion. I believe this is especially necessary where gas and dust are met in dangerous quantities in the workings. It is as important that the stoppings should be in place after an explosion, as before, in order that the ventilating current shall take its true course. I venture the opinion that more lives will be saved where the stoppings have withstood an explosion and remained intact, than where they have been blown out by the force of the blast. In the former case, the ventilating current will again resume its regular course, while, in the latter case, the ventilation in the workings would be deranged and the accumulation of gas that would result would make possible a second explosion and further loss of life.

In regard to gaseous and dusty mines, the main point to be considered in the ventilation of the mine is to divide the workings into separate ventilation districts or panels, and to leave a sufficient barrier of coal between the several panels. Where this system is adopted, an explosion of gas in one panel will generally be confined to the district in which it occurred. The air current in the other districts, or panels, would not be vitiated as a result of the explosion, and the situation is more easily handled immediately following the explosion.

The Coal Age Pocket Book

EXAMPLES IN HYGROMETRY

Caution—It is absolutely necessary in the use of such formulas as embrace terms or constants of a given denomination to use only values of that denomination. For example, the formula for finding the weight of moisture that will saturate a cubic foot of air at a temperature of t degrees, is

$$w = 0.6235 \frac{p_v}{0.37\,(460 + t)}$$

This is recognized as being derived from the formula previously given for finding the weight of one cubic foot of dry air at a pressure p and temperature t, by substituting for the atmospheric pressure p (lb. per sq.in.), the saturated vapor pressure for p_v (lb. per sq.in.); and multiplying the formula by the specific gravity of water vapor (0.6235) referred to air.

In these formulas, the pressure must always be expressed in pounds per square inch, because the constant 0.37 is in that denomination; and the temperature must be given in Fahrenheit degrees, for the same reason. Also, the weight will be found in pounds per cubic foot and if desired in grains per cubic foot, must be multiplied by 7000, as there are 7000 grs. in 1 cu.ft.

On the other hand, the formulas given for calculating the relative humidity of the air, or the actual vapor pressure contain the constant 88, which is based on barometric pressure (in. of mercury) and Fahrenheit temperatures. The constant 88 is used for all temperatures above 32 deg., and 96 for any temperature below 32 deg.

The table of saturated vapor pressures, on the preceding page, gives the pressure or tension of water vapor for different temperatures (Fahr. scale), from 30 deg. to 212 deg. The pressures are given both in inches of mercury and pounds per square inch.

Example—Find the actual vapor pressure, the relative humidity, dew point and weight of moisture present, in grains per cubic foot, when the readings of the dry- and wet-bulb thermometers are 62 deg. and 54 deg. F., respectively, and the barometric pressure is 28.2 in.

Solution—The actual vapor pressure, in this case, as calculated from the saturated vapor pressure corresponding to the wet-bulb reading (P_{54} = 0.4178 in.), is

$$p_v = 0.4178 - \frac{28.2}{30}\left(\frac{62 - 54}{88}\right) = 0.33235 \textit{ in.}$$

The saturated vapor pressure for the given temperature (see Table) is P_{62} = 0.5561 in., and the relative humidity,

$$H = \frac{0.33235 \times 100}{0.5561} = 59.7 \textit{ per cent.}$$

The dew-point temperature corresponding to a saturated vapor pressure of 0.3323 (see Table) is 47.7 deg. F.

The actual weight of vapor is

$$w = 7000 \times 0.6235 \frac{0.597 \times 0.2731}{0.37\,(460 + 62)} = 3.6 \textit{ grs. per cu.ft.}$$

Two Letters on Public Coal-Land Sales

SYNOPSIS—George Otis Smith declares that the Land Office has sold almost as much coal land in six years under the new valuations as in five years before under the old prices. Since July 1, 1907, it has disposed of 225 square miles. The average price of the assessed lands is $41.30, and of the sales, $18 per acre. In Colorado last year sales of coal resources equaled output. Appraisals have increased taxable values in the states where public coal lands have been evaluated.

⁂

Your editorial of Nov. 1 on "The Western Coal Lands" is incomplete in its quoted statements of fact. In the interchange of views between Senator Shafroth and myself, at the recent Philadelphia session of the American Mining Congress, I distinctly stated that the sales of government coal lands under the new system of appraisal compared favorably in acreage with those made under the former practice of disposal at minimum prices. The "solitary square mile" was mentioned only as the high-water mark in public coal-land prices, and as such was used as the basis for some extemporaneous comparisons of taxable values of coal land, of coal-mining plant and of output.

Recent Public Coal-Land Sales

The facts are that in the six years beginning July 1, 1907, when public coal-land appraisals began, the sales numbered 905 entries as opposed to "this one insignificant sale," as you term it, and the area sold was 225 square miles, rather than "a solitary square mile." In the five years prior to July 1, 1907, the acreage of coal lands sold as such was some nine square miles in excess of the area just given.

Again, that "$400 an acre" quoted in the Coal Age editorial is not at all a fair measure of the appraisal prices fixed by the Geological Survey. Under the regulations in force, a large part of the public coal lands will continue to be valued at the minimum prices specified in the law, $10 and $20. Thus it is that more than two-thirds of the sales under the new system have been at those minimum prices and the purchase of large acreages at these prices will doubtless continue. The average price for the 18 million acres appraised in the six years ended June 30 last, is $41.30, while the sales for the same period averaged about $18 an acre, or perhaps $5 more than for the corresponding period prior to 1907. It needs to be understood that the new prices are higher than the old only as well determined differences in tonnage and quality of coal are given consideration in the valuation of the lands. Large areas have been classified and valued, but each forty-acre tract is treated by itself in all appraisals above the minimum rate.

Sales of Coal Lands Equal to Output

In passing permit me to correct some Colorado figures given in Coal Age's excellent report of the Philadelphia meeting. I deny that there are "9,425,000 acres of (public) coal land in Colorado which could not now be purchased at any price and might later be offered for $400 per acre." The facts are: On July 1 last; there were 2,844,202 acres of public lands in Colorado classified and put on the market as coal lands at an average price of $59; there remained awaiting classification 5,037,721 acres, some of which has since been restored to entry; and the restorations to entry as coal land and non-coal land in Colorado during the preceding 12 months was more than 3 million acres. Also, the public coal lands sold in Colorado last year had an estimated tonnage equivalent to the year's output from Colorado mines. Several of these facts were mentioned by me at Philadelphia.

Appraisals Have Increased Taxation on Neighboring Coal Lands

The important subject of taxation, which was given special emphasis both by the Senator from Colorado and in your editorial, is a phase of this matter also fully appreciated by those of us charged by you as having "theories." Indeed, knowing as we do from personal experience and observation, that the development of the West brings in its train large public burdens, it has been a source of particular gratification to those of us working on the valuation of public coal lands in the Rocky Mountain States that our appraisals, which are a matter of public record in the local land offices, have resulted in the increase in taxable values of adjacent lands, and thus augmented the revenue available for public uses.

In counties where the assessors have had the interests of their fellow citizens at heart, the large corporate and private owners of coal lands have been forced to pay taxes on a coal-land valuation rather than on one based on the use of the land for grazing. The reports of this change in practice that come to our attention, both as criticisms from the large holders of idle lands and as requests for assistance by state officials, lead me to venture the suggestion that the local governments have largely benefited by reason of the federal policy of putting a reasonable valuation on the public coal lands.

Furthermore, recent legislation makes it possible for the surface of coal lands to be separately acquired for agricultural use, and such surface patents are being issued for hundreds of thousands of acres, with the result that to that extent the government coal lands are not untaxed any more than have been the millions of acres of railroad and other large grants and holdings of coal lands assessed on only a grazing-land basis. I mentioned this significant fact at Philadelphia.

Why Tax Coal Land and Not Output?

In conclusion, permit me to suggest in the columns of the Coal Age, as I did on the floor at the Mining Congress, that the principle of taxation of coal in the ground has little beyond the sentimental force of precedent to support it. The need of the community for returns from taxable property and the ability of the owners to pay taxes are better harmonized in a system of taxation on output.

Let us extend the principle of the Federal income tax and have state and local taxes that come nearer to varying directly and not inversely with the taxpayers' ability to pay. Moreover, as pointed out by R. V. Norris in his address at Philadelphia, reported in full in the Nov. 1 issue of the Coal Age, even moderate taxation of the coal in the ground puts a tremendous premium on haste and waste in mining, while the suggested method of a tax on output would result in the payment of taxes in maximum amounts at times of greatest production and largest local population and consequent need for public funds.

and would discourage mining in advance or in excess of normal demand.

George Otis Smith,
Director, U. S. Geological Survey.
Washington, D. C.

(Letter No. 2)

Your editorial on "The Western Coal Lands," in Coal Age for Nov. 1, reminds one of the old definition of a lobster as "a red fish that walks backward," recalling that the lobster is not red, is not a fish and does not walk backward. Confident from constant reading of your journal that you wish to be both accurate and fair, I venture to offer some figures and suggestions. You say:

> Mr. Smith . . . . has managed after a long delay to dispose of a solitary square mile.

While Mr. Smith is doubtless interested in the sale of the public coal lands, the Survey of which he is director has nothing to do with the sale beyond setting the price which, in the majority of cases, is the minimum allowed by law. There has been no delay in the sale of coal lands, as sales have proceeded month by month at practically the same rate as before the present policy was adopted. Instead of "this one insignificant sale," "a solitary square mile," of 640 acres, the government, under the present policy, has sold over 144,000 acres.

Survey Would Put Some Coal Land below Legal Limit if Permitted by Law

The implication of the second paragraph that the Western coal lands are being held at $400 per acre, as though that were the usual or average price, is misleading, to say the least, for the average is almost exactly $^1/_{10}$ of that figure. As just stated, most of the coal land is and will be priced at the minimum allowed by law, namely, $10 or $20 per acre, and much of it would be priced still lower did the law allow. On the other hand, where the land priced is in the center of one of the fields of high-grade coal, near successfully operated mines, the prices may be as high as several hundred dollars, if the coal is of coking character or if present in many beds or is of great thickness. The land cited by you as selling at $400 per acre is in the heart of one of the best fields of the West and adjoins large working mines, with 70 ft. of developed coal, of probably a little better grade than that of the Illinois and Indiana coal now going into Chicago. Under the present regulations, as high a price as $400 per acre could only be given under these extremely favorable conditions of location and knowledge of coal quality and tonnage. The statement that Western coal lands "held for $400 * * * * * would barely bring $5 or $10 per acre * * * * * if sold by individuals" must certainly have been a slip of the pen. As a matter of fact, the government sale prices are based on and compare favorably with private sale prices in the same fields when the lands are sold on the same basis; that is, for immediate development with both buyer and seller knowing the quantity and quality of the coal.

Appalachian and Western Prices

You state in another paragraph:

> The majority of the fuel in the Appalachian States can be bought for $5 to $100 per acre.

Undoubtedly *"the majority"* of the fuel in the Appalachian States can be bought at prices within the limits given, notwithstanding the fact that a perusal of the columns of Coal Age for the present year fails to show a single sale of coal lands in the Appalachian field at less than $30 per acre and shows many sales at over $100 and up to $2000 per acre. There are doubtless plenty of coal lands in the Appalachian States that can still be bought at less than $30 per acre, and many of them will never be worth that sum. On the other hand, the larger part of the coal lands of the West are and will continue to be valued at the minimum price allowed by law, $10 to $20 per acre.

The unfairness of your editorial is in comparing the highest-priced lands of the West with the lowest-priced lands of the East, as though they are in any way comparable in actual value. It is true that none of the Western coal lands have ever sold at as high a figure as some of those in southwestern Pennsylvania or the anthracite fields of that state, but lands containing good coal, situated near railroads, are limited in the West and, where they occur, the coal finds wide and ready sale, yielding, as a rule, a higher average profit per ton than similar coals in the East.

After all, the value of coal lands is determined by the net profit per ton and the available tonnage and, as most of the limited fields of good coal in the West near railroads are in private hands, and as many of them contain from 2 to 20 times as much available coal per acre as most of the Eastern coal fields, this, with the higher average net profit per ton, will explain the good prices at which coal lands in the West are sold between private parties. A comparison of assessments on coal lands in Colorado, as taken by the writer from the county assessor's manuscript reports (as given on page 34 in Survey Bulletin 424), with the assessments on Eastern coal lands shows that the Western coal lands in the limited fields of high-grade coal are held at as high, if not at higher, figures than lands containing coals of corresponding quality in the East.

Land Valuations Are Not Throttling the West

The questions which you raise as to taxation are a little out of my line, but I cannot help noting that the surface of coal lands is open to entry under the homestead, desert land and other forms of non-mineral entry, to whomsoever will use them and thereafter subject to taxation like other agricultural lands; that Wyoming, the principal coal state of the West, does not tax coal in the ground but as it is mined; that instead of "development * * * * * being throttled," the Western coal operators have the same complaint of over-competition as their brothers in the East, though it is not so keen or grinding. The Western coal mines are today amply meeting all of the market demands of that region for coal and apparently are pushing out into territory that would appear to belong to other fields further east, as when Wyoming coals are shipped to Omaha, and they are doing this with probably a little more satisfactory financial returns than the mines of the East. It is this slightly higher return for mining in the West, especially in the limited fields of the better coals, that is reflected in the prices of Western coal lands where sold by private owners. High retail prices of coal in the West are not the result of artificially restricted development, but of long average haul, slightly higher cost of mining (averaging about 30 per cent.) and possibly slightly better net profits.

If it be admitted that the present coal-land laws are entirely inadequate to properly meet present conditions of the coal industry, I cannot see how the public would profit by your suggestion of a return to the last century interpretation of those laws. Rather, we need new laws based on first-hand information that will be fair to present coal owners and operators and to the public as the present owner of much coal and as the present and future users of coal.

George H. Ashley,
Chief, Coal Section, Land Classification Board.
Washington, D. C.

You Are Interested in This

The next few issues of Coal Age will be the most interesting and valuable ever published. There will be an article on "Shaft Sinking," which will describe how obstacles were overcome when sinking through water-bearing strata. There will also be an article describing the coke plant owned by the State of Tennessee. The author will give valuable cost data, both on construction and operation. Another article will describe the coal fields in Nova Scotia, and still another writer will expound a theory regarding the process of coal formation. He will try to prove that anthracite is the result of extreme pressure, and that it is formed from bituminous coal at a far lower temperature and in shorter time than soft coal is developed.

Then there will be an excellent article defending the flame safety mine lamp, which will show that such lamps have been blamed unjustly for many mine disasters. The author declares that he believes a safety lamp may be crushed in a gaseous mixture without causing an explosion. A European writer has given us an article on "Cementation in Shaft Sinking." This will describe methods employed in France to effectually exclude water from shafts, both during sinking and subsequently. These are only a few of the articles we will print in the next two or three issues. Two or three of those above mentioned will appear next week. If you are interested in the latest progress in coal mining, this reminder is sufficient.

COMING SOCIETY MEETINGS

The Coal Mining Institute of America will hold its winter meeting at the Fort Pitt Hotel, Pittsburgh, Penn., Dec. 4 and 5. C. L. Fay, Wilkes-Barre, Penn., is secretary.

West Virginia Coal Mining Institute will hold its winter meeting at Charleston, W. Va., on Dec. 8, 9 and 10. Neil Robinson, Charleston, W. Va., is president; E. N. Zern, Morgantown, W. Va., is secretary.

The Scranton District Mining Institute will hold its annual dinner in the Town Hall at Scranton on the evening of Nov. 29. It is reported that upward of 1200 banquet tickets have already been sold. J. H. Dague, of Scranton, is president.

An International Exposition on Safety and Sanitation will be held Dec. 11 to 20, at the Grand Central Palace, under the auspices of the American Museum of Safety. Dr. Tolman, of 29 West 39th St., New York City, is director general of the exposition.

The Rocky Mountain Coal-Mining Institute has decided to postpone indefinitely the November meeting which was booked for Denver. This decision is due to the serious strike situation which now exists in Colorado. F. W. Whiteside, Denver, Colo., is secretary.

Fuel Consumption in California

On account of the large production of petroleum in California, and its use for fuel, coal mining has practically ceased in that state. According to Edward W. Parker, of the U. S. Geological Survey, the production of coal in the last two years has been only 10,747 tons in 1911, and 10,978 tons in 1912.

The production of petroleum in California in 1912 was 86,450,767 bbl., of which not less than 50,000,000 bbl. was used directly for fuel. Large quantities of oil were also used in place of coal for gas making, and on the estimate of 3½ bbl. of petroleum, being equivalent to one ton of ordinary bituminous coal, it is probable that from 14,000,000 to 15,000,000 tons of coal would be required to perform in California the service now rendered by petroleum in the production of heat, light and power.

There is still, however, some demand for coal in California, particularly for domestic use and for the bunker trade at San Francisco, but this is almost exclusively supplied by coal from other states or from abroad.

There are within the state a number of small, widely separated coal fields, chief among which are the Mount Diablo field, of Contra Costa County, the Corral Hollow field, of Alameda County, the Priest Valley and Trafton fields, of San Benito County, and the Stone Cañon field, of Monterey County. The first two, which are on the eastern border of San Francisco Bay, and consequently in the west-central part of the state, produce black lignite or semibituminous coal.

The coals in Monterey County are of the same geologic age as those farther north, but they have been altered into true bituminous. The alteration in the San Benito County area has not progressed so far as in Monterey County, but the coals closely approach the bituminous grades. None of these, however, possess coking qualities.

Explosion at Acton, Ala.

An explosion in No. 2 mine of the Alabama Fuel & Iron Co., at 3:45 on the afternoon of Nov. 18 probably entombed 40 miners. Up to 9 o'clock the bodies of L. L. Patterson, E. Bright, John Langston, Henry Childers, Burns Kittrell and two unidentified negroes had been recovered. Kittrell went into the mine to do some cleaning, only five minutes before the explosion occurred. On Nov. 19 the number of dead recovered totalled 24 and 6 had been rescued alive.

Some of the victims are white and some are negroes. The normal quota of employees is 70 men, but as Nov. 17 was payday, some of the men did not report for work on 18th.

The first rescue parties reported several dead, lying beside the tramway of the main slope. State Mine Inspector C. H. Nesbitt and a number of surgeons arrived from Birmingham.

The mine has been considered one of the best equipped in the district.

Erratum

In our issue of Nov. 8, the article entitled "A Central Station in West Kentucky," appeared as being written by Newell G. Alford, of Earlington, Ky. This should have read, "By Newell G. Alford and Robert E. Wipfler, engineers for the St. Bernard Mining Co., Earlington, Ky."

INQUIRIES OF GENERAL INTEREST

Gas in Pump Discharge

We are pumping water 600 ft., from the swags in a nongaseous mine. At the end of the discharge pipe line, we can light the gas. Since no gas is generated in the mine, I would like to ask if you can explain where this gas comes from that is given off at the end of the pipe.

J. W.

Sullivan, Ind.

The gas is probably marsh gas (CH_4) with which the water is charged. It is common, in marshes, to see bubbles of gas rising to the surface of stagnant pools containing more or less organic matter. The slow decay of this matter forms marsh gas, which fact suggested the name of the gas.

In the present instance, the gas given off at the end of the pipe line may have been formed in the same manner; but it is more probable that the gas is given off from the strata underlying the coal seam, in such small quantities as not to have been noticed or detected in the mine workings. There are many mines generating small quantities of gas, in this manner, which are supposed to be "nongaseous mines"; because the quantity of gas generated is so small that it is carried away by the air current as rapidly as formed.

It is probable that, under the action of the pump, the gas absorbed by the water is liberated in the pipe line. The vacuum created by the suction of the pump and the motion given to the water in the act of pumping, would both tend to liberate the gas, which would burn when ignited in contact with air.

⁂

Burning Culm Piles

The slow burning of slack piles has proved an intolerable nuisance in many mining camps. Can you give me information of the cause of these piles taking fire and the best way to handle the fire after it has started, so as to cause its extinction?

A. H. Gardner.

Louisville, Ky.

The cause of slack or culm piles taking fire is commonly due to the generation of heat within the pile. The fire may have been started, in some cases, by a stray spark from a locomotive or chimney; but, in the large majority of cases, the fire is due to spontaneous combustion taking place within the pile. The prevention of these fires is more easily accomplished than their extinction. In order to prevent a culm pile firing, it is necessary to avoid, as far as possible, the mixing of fine coal and slack with the waste of the mine. Another means of prevention is to carry off the heat generated within the pile, as far as this can be done. In some cases, this has been accomplished by drilling holes into the pile and sinking pipes to provide a sufficient ventilation to reduce the heat within the pile; but not allowing of the admission of sufficient air to promote combustion. How far this plan will be successful will depend very much on the inflammable nature of the coal, the size of the pile, the presence of pyrites or sulphur in the coal slack, and other causes that favor the generation of heat.

When fire in a culm pile has attained considerable headway, it is a difficult matter to extinguish it. Water is only a temporary benefit thrown on the pile, as the moisture thus provided greatly assists the decomposition of the coal and the generation of heat, with the result that the fire will be increased rather than decreased, later. A more practicable way of dealing with the situation is to dig out the fire, in its early stages, and do everything possible to decrease the heat being generated in the pile, as previously suggested.

In this connection, we would draw attention to the editorial in the present issue, entitled: Combustion of Coal, which suggests the great value of much mine waste, in the production of power. By the installation of a proper grate and furnace, the waste heaps of former years can be utilized to good advantage, for power purposes. This is what should be done with all culm piles, the burning of which proves a nuisance in any community. No argument is required to prove the economy of so doing. Instead of being a nuisance, the waste heaps then become a source of revenue.

⁂

An Important Inquiry

From the time the first issue was published, to the present, I have been an interested reader of Coal Age, and have been particularly impressed with the practical nature of the discussion, of many important mining questions.

In regard to discussion, there is one question that occurs to me, which I believe should be brought to the attention of readers, and some definite policy decided upon, in order to arrive at practical conclusions as to what should be considered the most safe and sane way of handling the many difficult and dangerous problems that confront mining men today.

We have all noticed that the opinions expressed by practical mining men of equally long experience and intelligence, differ widely as to the best methods to pursue on occasions calling for prompt and efficient action to effect the rescue of lives endangered or the protection of property. It seems to me that some method should be suggested or some means adopted that will determine the superiority of one method over another. Certainly, in the discussion of such important questions as: Starting a Fan after Explosion; The Use of Mixed Lights in Mining; The Building of Collapsible Stoppings; etc., some definite conclusion should be reached. What can be done to gain this end?

Charter Subscriber.

Johnstown, Penn.

[The above is one of a number of similar inquiries received from time to time, and we would be glad to receive suggestions as to the best method of bringing the discussion of a question to a successful and practical climax.—Ed.]

EXAMINATION QUESTIONS

Miscellaneous Questions

(Answered by Request)

Ques.—What horsepower will be required to haul a loaded trip of 15 cars, weighing 1 ton (2000 lb.) each, up a 5 per cent. grade, 3800 ft. long, at a speed of 350 ft. per min.?

Ans.—When the grade is slight, as in this case, say less than 10 per cent., the weight of the loaded trip can be taken as the normal pressure on the incline; and, in this case, in order to find the load on the rope, it is only necessary to add together the tangent of the angle of inclination or the percentage of grade and the coefficient of rolling friction, which may be taken as 0.025. Multiplying this sum by the weight of a loaded trip will give the load on the rope. Thus,

$$L = 15 \times 2000\ (0.05 + 0.025) = 2250\ lb.$$

If greater accuracy is desired, a certain size of haulage rope should be assumed and its weight added to the weight of the loaded trip. Thus, in this case, a ¾-in. six-strand, seven-wire rope of Swede iron can be used, weighing 0.89 lb. per lineal foot. The total weight of this rope on the incline is then 3800 × 0.89 = say 3400 lb. This makes the total load hauled when the trip is at the foot of the incline, 15 × 2000 + 3400 = 33,400 lb. The total load on the rope is then

$$L = 33{,}400 \times 0.075 = say\ 2500\ lb.$$

At the given speed of hauling (350 ft. per min.), the required effective horsepower is

$$H = \frac{2500 \times 350}{33{,}000} = 26.5\ hp.$$

Allowing an efficiency of 75 per cent., which is more than sufficient for any ordinary slide-valve haulage engine, the required horsepower of the engine is 26.5 ÷ 0.75 = 35 hp.

Ques.—Find the horsepower of an engine, having two cylinders, each 30 in. in diameter, and a 5-ft. stroke, when the engine is making 60 strokes per min., with an average steam-cylinder pressure of 30 lb. per sq.in. and an average back pressure of 4 lb. per sq.in.

Ans.—The sectional area of each cylinder is

$$a = 0.7854 \times 30^2 = 706.86\ sq.in.$$

The average effective pressure, in this case, is 30 — 4 = 26 lb. per sq.in. The total effective pressure, for a single cylinder, is, then, 706.86 × 26 = 18,378+ lb. For a 5-ft. stroke and a speed of 60 strokes per min., the piston travel is 5 × 60 = 300 ft. per min. At this speed, the horsepower developed in a single cylinder, is

$$H = \frac{18{,}378 \times 300}{33{,}000} = 167\ hp.$$

For a duplex (two-cylinder) engine, at this speed, the horsepower developed would be 2 × 167 = 334 hp.

Ques.—(a) What is "lead", and why is it desirable that the valve have lead in a quick-running engine? (b) Why should exhaust pipes be larger than steam pipes?

Ans.—The valve of a steam engine is said to have lead when it is set at a slight advance so as to open the steam port a little before the piston reaches the end of its stroke. By this means, the live steam entering the cylinder assists the steam compressed in that end of the cylinder, to reduce the shock of the reciprocating parts and the engine runs more smoothly.

(b) The volume of the exhaust steam is always greater than that of the live steam admitted to the cylinder, because of the reduced pressure caused by the opening of the exhaust port. In order to accommodate this larger volume and to reduce to a minimum the back pressure in the cylinder, the exhaust pipes should always have a greater sectional area than the steam supply.

Ques.—What must be the sectional area of a square airway that is required to pass 50,000 cu.ft. of air per minute, under a water gage of 1 in., the length of the airway, including the return, being one mile

Ans.—A water gage of 1 in. corresponds to a ventilating pressure of $p = 5.2$ lb. per sq.ft. The formula for ventilating pressure, in terms of the quantity of air in circulation and the dimensions of the airway, is

$$p = \frac{k l o q^2}{a^3}$$

But for a square airway, $o = 4\sqrt{a}$. In order to avoid two unknown quantities, it is necessary to substitute this value for o in the formula, which gives

$$p = \frac{4 k l \sqrt{a} q^2}{a^3} = \frac{4 k l q^2}{\sqrt{a^5}}$$

Solving this equation for a, gives

$$a = \sqrt[5]{\left(\frac{4 k l q^2}{p}\right)^2}$$

Finally, substituting the given values in this equation gives, for the sectional area of the airway,

$$a = \sqrt[5]{\left(\frac{4 \times 0.00000002 \times 5280 \times 50{,}000^2}{5.2}\right)^2}$$

$$= 132.76\ sq.ft.$$

Ques.—Where is a common place for the piston rod of an ordinary hoisting engine to break?

Ans.—Piston rods that are secured to the follower by battering down the end of the rod so as to hold the follower firmly against a shoulder of the rod, instead of using a nut for this purpose, frequently work loose, the rod pulling out of its socket.

A more common occurrence, however, is for the piston rod to develop weakness at the point where it enters the crosshead. This is especially the case when there is any lack of alignment in the guides. The piston rod is more likely to break at this point than elsewhere.

Ques.—What parts of a boiler require strengthening by stays?

Ans.—In a plain cylindrical boiler it is necessary to stay the flat surfaces of the boiler, as, for example, the boiler ends.

COAL AND COKE NEWS

Washington, D. C.

The Interstate Commerce Commission has at last embarked upon what is perhaps its most important coal inquiry. Hearings in the case will be conducted first of all at Philadelphia and later at New York and Washington. The inquiry started on Nov. 17 in Philadelphia but all preparations had been made before that time. The Commission starts the proceedings on its own initiative because of a belief on its part that anthracite rates were unreasonably high. While the rumor is in constant circulation that the commission intends to bring about a reduction of from 15 to 20 per cent. in the charge for hauling coal from the mines to tidewater, no positive evidence in support of the idea can be secured. The fact that the anthracite rates are a good deal higher, relatively speaking, than other freight rates is admitted, and it is also acknowledged that in every recent instance where these rates have come up before the commission for adjudication there has been a reduction or a criticism showing that that body was disposed to reduce them.

Many data have been collected in advance of the actual opening of the hearings. These have been intended to show the character of the ownership of the railroads and of the anthracite deposits, with the apparent intention of demonstrating that this ownership is all in practically identical hands. Elaborate maps showing the movement of the coal have been prepared and filed by the roads and information has been furnished concerning the physical value of the properties and of their equipment. Estimates have also been made of the value of land and other investments, including trestles, sheds, wharves, docks, scales, coal pockets, buildings, etc., used by the coal carriers. Statistics as to the traffic movement on each of the roads have also been compiled and furnished to the commission to afford a basis for decision as to the equity of the anthracite rate. The Government has claimed for some time, that the alleged failure of the roads to live up to the commodities clause has made them less anxious to increase efficiency and decrease mining costs than would be the case if the mines were owned and controlled by an independent corporation entirely dependent on mining for its profits. This has been based on the belief that whenever there was a lack of profit from mining it has been made up by an increase in the charge for hauling the coal and vice versa.

Trust Inquiry to Use Data of Commission

Another assertion concerning the inquiry which opened on Nov. 17 is that an outcome of it may be found in the filing of antitrust suits at Washington as a result of the information developed in the course of the work there. This statement seems to be little more than conjectural, save that there is a basis for it in the fact that there is a disposition among Government officials to look for a ground of complaint, which would enable them to apply the Sherman law and thereby to get the credit of uncovering the violations, and bringing the offenders to justice. It is true, however, that while the scope of the proceedings now pending will be large, it is not possible, accurately, to forecast the extent to which they may be carried and they may have ramifications which are not now altogether evident.

Increased Pay to Trainmen and Full-Crew Bills

Estimates of the increased costs due to the award in the trainmen's arbitration case, have shown that the increase of 7 per cent. in wages will fall very heavily upon the so called coal roads between the anthracite regions and the coast points. This increase in expenses cannot be precisely estimated, but it is regarded as likely to fall heavily upon the same roads that have been already subjected to materially increased expense, in consequence of the full-crew bills adopted by Pennsylvania and other neighboring states within the past few months. The arbitration board declared that an increase in the cost of living equal to at least 7 per cent. of the cost in 1910, had occurred and this was practically the sole ground upon which action was taken. It is not believed to be an altogether fair estimate of the added cost of living in the section covered by the anthracite roads.

With reference to the apparent suggestion contained in the report that additional increases in operating expense will necessitate additional charges for freights, this is but one of many similar suggestions which have lately been coming to the Interstate Commerce Commission and to other Federal authorities, in favor of a prompt action by the commission designed to grant the 5 per cent. increase for which application has been made, or, at all events, to give the railroads some power to make charges above those that are now exacted by them for the movement of freight. It is quite generally admitted in administration circles that the case of the railroads is being greatly strengthened by such action as that of the arbitration board.

An inquiry of some importance and extent was instituted by the Interstate Commerce Commission on Nov. 17 with reference to the rates on bituminous coal from points in Virginia, West Virginia, Kentucky and Tennessee to points in Virginia, North Carolina, South Carolina, Georgia and Florida. The investigation thus planned will extend work which has been in progress in connection with coal rates in the bituminous field for some time past, the previous investigation of such rates having been more or less sporadic and dependent upon individual complaints filed from time to time.

HARRISBURG, PENN.

Suggestions of importance to both the miners and the operators of the anthracite fields were prepared at a meeting of the subcommittee of the mine inspectors of Luzerne County at a recent meeting in Wilkes-Barre. The meeting was the result of a session of the inspectors from this state held about a month ago in that city with James Roderick, the chief of the department of mines of the state.

At the meeting of the committee it was found that more than 75 per cent. of the accidents which occur in the anthracite fields are due to three causes, which are: Falls of coal and rock, the use of powder and other explosives, and to mine cars.

In regard to the first cause in which a large number of men is injured, it was suggested by the committee of inspectors that the chambers and gangways be made more safe by employing an additional number of props and timbers, the latter to be placed at smaller intervals than is now the practice. It was pointed out that in many cases the accidents from falls of coal and rock are caused by the failure of the men to place the timbers close enough together to prevent any of the loose material from coming through. Instances were cited where a piece of rock from the roof had slipped through without any warning and caused injury to either the miner or laborer, when if the timbers had been placed close enough together such an occurrence would have been impossible.

In regard to the use of explosives the committee is determined that more care shall be used in the handling of the same than is now exercised. It was pointed out that the only precautions adopted by many of the men in handling powder are those printed on the package. One bad practice of the miner of today is to open his keg of powder and make a charge while the contents are exposed to view. In many cases a spark from his lamp may fall into the keg, and the next moment an explosion occurs which may cause an explosion of gas and the injury of more men than the miner himself.

Precautions of Susquehanna Coal Co.

A compliment is paid the Susquehanna Coal Co. for the manner in which it is looking after the safety of the men in its employ. It was stated that the company had at its own expense placed 22 men at work, their sole duty being to instruct employees as to how to avoid accidents. The men go through the workings of the colliery daily and make suggestions to the men employed therein, and see that the same are carried out. The result of this system is most satisfactory to the company, and has resulted in a decrease in the number of accidents.

Those who were present at the meeting of the committee and the districts represented by them are: Hugh McDonald. sixth; Thomas J. Williams, seventh; S. J. Jennings, eighth; D. T. Davis, ninth; Joseph J. Walsh, tenth; David J. Roderick, eleventh.

PENNSYLVANIA

Anthracite

Mount Carmel—A 7-ft. bed of coal has been found on the Bolich property near Taylorville, and a 25-ft. seam has been discovered at the Locust Spring mine, of the Philadelphia & Reading Coal & Iron Co. The output of the colliery will be greatly increased by this new discovery. The Reading Co., have just opened a new hospital and washroom for the miners at the foot of the Locust Spring shaft.

Dunmore—The Pennsylvania Coal Co. is reported to be negotiating for the purchase of the Sibley colliery of the Elliott-McClure Co., on the mountainside, west of Old Forge. Formal announcement is expected soon.

The Sibley colliery has been in operation for many years as an independent company. The coal beds are said to contain many thousands of tons of coal yet. The Elliott-McClure Co., present owner, is a Philadelphia concern, and has worked this mine for several years.

Scranton—Following the dismissal of two slate pickers, 1000 miners struck at the Bellevue colliery, owned by the Lackawanna Co. The boys charge that the boss was discriminating against them, and when they complained of the alleged unfair treatment the strike was called.

A settling caused by mine working started in the rear of a building on South Washington Ave., the hole was ten feet in diameter and thirty feet in depth. The mine underneath this part of the city is operated by Sloan and the Central Coal Co.

Plymouth—The Delaware & Hudson Co. tract, in the vicinity of No. 4 shaft is perforated like a sieve with cave holes, which allows the surface water to flow into the mine workings, and to prevent this, a force of men have been put to work to change the course of a stream from the mountainside toward Brown's Creek. The borough has instructed its attorney to apply for an injunction restraining not only the D. & H. Co., but also the Lehigh & Wilkes-Barre Coal Co. and Kingston Coal Co., from allowing water to flow over its streets and into Brown's Creek.

The settling in the Dodds mine of the Plymouth Coal Co. caused considerable damage to property on Main St., and for a time it was feared that some of the buildings would topple over.

Bituminous

Brockwayville—The Toby Coal Co. operating in Elk County, has purchased a new tract of coal lands and will open a mine to take the place of the Black Diamond mine, which is almost exhausted.

Harwick—The Allegheny Coal Co. has filed a suit against three miners in which it seeks to recover $500 damages from each, for the defendants' refusal to vacate houses of the company after having received due notice to do so.

Du Bois—The Northwestern Mining & Exchange Co. will soon begin the sinking of a shaft at Cramer Station, Jefferson County, on the Buffalo, Rochester and Pittsburgh R.R., which is expected to result in the building of a new mining village and one of the largest coal operations of that company in this part of the state. Work is expected to start very soon.

Pittsburgh—For almost a year there has been such a brisk market that the demand for good coal land has been steady and it is at present said to be better than in a long time. A 5000-acre tract of coal in Cumberland Township, Greene County, is being examined as to the titles, preparatory to being transferred to a big steel company, the selling price averaging about $1000 per acre. The coal land belongs to J. V. Thompson and others at Uniontown, but just what steel company is buying it has not been disclosed. One rumor is that it goes to the Jones & Laughlin Co., but this is denied by a member of that corporation. Large tracts of coal in Allegheny, Washington and Westmoreland Counties are also being so closely held, as to be practically unobtainable, which accounts for the good prices being obtained for coal farther away from Pittsburgh.

The H. C. Frick Coke Co. recently filed a suit against William P. Snyder in which it seeks to recover $80,000 damages. It is alleged in the statement of claim filed by the company that Snyder and Charles Donnolly, now deceased, owned the McClure Coke Co., which was later purchased by the H. C. Frick Coke Co. It is averred by the plaintiff that it has been compelled to pay obligations which belonged to the McClure Coke Company.

The Pittsburgh-Buffalo Co. has paid to the Union Trust Co., trustee of the first mortgage bonds, $272,000 for sinking-fund account, to retire and cancel bonds of that amount.

The Johnetta Coal Co., a subsidiary of the Pittsburgh-Buffalo Co., during the week satisfied of record $57,144 of mortgages, held by owners of coal lands in Washington County.

WEST VIRGINIA

Clarksburg—The severe storm laid off 2000 miners, railroad cars being unobtainable.

Wellsburg—Four hundred men of the West Virginia and Pittsburgh Coal Co. at Gilchrist and La Belle are out to obtain the 8-hour day, check weighmen and a recognition of the union. The company will not concede the last demand.

Charleston—One death and three nonfatal accidents each working day is the record of the coal mines of West Virginia for the four months ending Oct. 31.

Following the purchase of the New River coal field by British interests, local operators predict that it may not be long until other extensive holdings pass formally into foreign ownership. Agents of D. A. Thomas, Welsh mine owners and capitalists, are in the West Virginia fields, and it is understood they have gathered options on more than 30 properties, with an annual output of 2,500,000 tons.

The case against John P. White, national president of the United Mine Workers of America and other national and district officials was called Nov. 18. The defendants are indicted for alleged conspiracy in restraint of trade.

Governor H. D. Hatfield and Chief Inspector E. A. Henry are conferring on a system of classification of mines into nonhazardous, hazardous and extra-hazardous operations. It is proposed that the more hazardous be more frequently inspected and the system is to be used as a basis for liabilities chargeable under the working men's compensation law.

Coal operators from Kanawha and New River districts met Nov. 8 and appointed a committee to confer with the Chesapeake and Ohio R.R. relative to car supply. Failing redress they propose to appeal to the state public service commission or the interstate commerce commission.

KENTUCKY

Henderson—The coal men nearby have started a price war and prices have been reduced 25 to 50 per cent.

Providence—Several thousand acres of coal privileges in the Lisman, Corluth and Nebo sections have been sold to Pittsburgh capitalists, W. L. Baker, of the Corluth country, secured options on the property some time ago. The syndicate will open mines.

Whitesburg—It is reported that a deal is pending between C. Bascom Slemp, the Virginia congressman and coal operator, and the Mineral Fuel Co. and the Consolidation Coal Co., looking to a change in the ownership of Mr. Slemp's fine coal properties in the Boone's Fork region. Mr. Slemp and a number of other prominent coal operators recently went through the new operations of the Mineral Fuel Co. at Fleming and Potter's Fork, and also visited the Consolidation Coal Co.'s mines at McRoberts, Dunham, Jenkins and Burdine.

ALABAMA

Acton—Twenty-four miners are known to have been killed and at least 12 others are still missing as a result of an explosion at the Alabama Fuel and Iron Co.'s No. 2 mine near here. It said that 43 men, the majority white, went into the workings early today but how many left before the explosion is not known. The Federal mine-rescue automobile car, recently transferred to Birmingham, made a quick run of 34 miles to Acton, arriving at the same time as the Tennessee Coal & Iron Co.'s rescue car which was dispatched by special train. The mine fan was not injured and was set in motion at once.

OHIO

Belle Valley—The Imperial Mine of the O'Gara Coal Co. had another explosion Nov. 12 in which one man was burned.

Columbus—Joint ownership of the Kanawha & Michigan Ry. by the Lake Shore and Chesapeake & Ohio Ry. must cease by order of U. S. Circuit Court.

Secretary B. F. Nigh, of the Ohio-Indiana-Michigan-Coal Association has been called before the Interstate Commerce Commission in the anthracite coal freight hearing. Mr. Nigh represents the association which consists of hundreds of dealers throughout the states of Ohio, Indiana and Michigan who are asking for a general reduction in anthracite rates. It is claimed that the rate to Buffalo compared with other rates of like distance is inequitable.

The joint legislative commission which was named by Governor Cox to investigate and report on a policy respecting the future of the canals of the state will meet in Columbus soon to take evidence. Coal men are very much interested in the proposition as the question of the abandonment of Ohio canals will be considered.

ILLINOIS

Springfield—Pittsburgh Coal Co., of Pittsburgh, purchased at receiver's sale all the properties of the Illinois Collieries Co. in Sangamon, Macoupin, Montgomery and Bond Counties for $2,000,000. The bonds were principally held by the Pittsburgh Coal Co. The receivership dates back to 1909.

Taylorville—The Christian County Coal Co.'s mine is closed and 350 men are on strike to get better terms for two motormen. The men do not work every day and want $87.45 per month.

Eldorado—The miners of the Eldorado Coal & Mining Co. are on a strike, to force the above named company to remove the mine manager, because he permitted violations of the mining law.

The miners have made a complaint to the State Mining Board, asking that the manager's certificate be canceled.

Belleville—Owing to the cylinder head of one of the cylinders of the hoisting engine at the Massie mine blowing out, the mine was closed down several days, and a serious accident was averted by the presence of mind of the engineer in applying brakes, preventing one of the cages dropping.

INDIANA

Petersburg—Parish & Co., of Bicknell, who have leased 1600 acres of coal land west of this city, are testing the territory with core drills for a suitable location for the shaft.

Terre Haute—An explosion occurred at the new mine of the Clovelly Coal Co., near here, on Nov. 10, driving both cages to the top of the tipple and causing great damage to same.

Three men are dead, the result of an explosion in the Higgins-Martin coal mine at Pine Ridge. Two of the men were suffocated, and the engineer died from heart failure, due to the excitement incident to the explosion.

COLORADO

Denver—Forbes, a camp of the Rocky Mountain Fuel Co., 12 miles north of Trinidad was reoccupied by the state militia on Nov. 5 after a skirmish in which Robert Nichol, the superintendent was fired on. The operators in the strike district agreed on Nov. 7 to take back all strikers but those guilty of crimes. It is said there are 140 thus blacklisted. The operators still refused, however, to recognize the union.

Large numbers of miners were returning to work at that date but the fight at Forbes was renewed Nov. 8 killing 5 nonunion men, probably mortally injuring 2 others, less seriously hurting another; four troopers were deported, two nonunion men beaten and four R.R. bridges burned. At La Veta three guards bringing home a miner were ambuscaded and all four men killed.

Gov. E. M. Ammons threatened to call on the U. S. troopers at Fort Douglas as he was hampered by State Auditor Roady Kenahan leaving the state without signing certificates of indebtedness for the support of the militia. At a joint meeting of the chamber of commerce and the real estate exchange, Frank Gove, counsel for the Victor-American Co. offered to give the city or state a mine, as the company officials wanted to see how successful municipal or state operators would be. On Nov. 11, five miners confessed to the ambuscade and murder at La Veta.

Pueblo—Judge Lewis declared to the grand jury investigating the strike, that attempts to prevent the mining of coal, which was still in the ground was not a conspiracy in restraint of trade.

MISSOURI

Fulton—The Callaway Coal Co. has begun stripping operations, with a $25,000 stripping machine at its property five miles southwest of here. The machine, it is estimated, will uncover 200 tons of coal a day, and at this rate between seven and eight acres of coal will be mined in a year. The company has options on 200 acres of coal lands which will be all that will be needed for several years. The machine will remove earth and rock 30 ft. deep at a single operation.

WASHINGTON

Spokane—Attorney N. W. Prockett, of the Puget Sound Traction, Light & Power Co., of Tacoma, Seattle and Olympia, has asked the Public Service Commission for the privilege of putting into effect at once the new tariffs for power furnished the coal-mining operators of western Washington. The privilege will be granted as soon as a few changes are made.

Organization of the Wilkeson Light, Fuel & Power Co. has been finally consummatd by coast men, taking over 960 acres of coal lands in Pierce County near the town of Wilkehon, and including the Briar Hill, Davis and Bowen properties, which are said to contain between 60,000,000 and 80,000,000 tons of high-grade bituminous coal. A townsite will be established and a light, water and power plant put into operation just as soon as possible.

NEW MEXICO

Dawson—Rees H. Beddow states that the explosion of Oct. 23 was caused by coal dust. The U. S. Bureau of Mines found only 0.19 per cent. of methane in the sample of air sent from the mine a week before explosion. In last 10 days experts have hunted gas and have nowhere seen a cap on the lamp. The loss of life is fixed at 263 men.

ALASKA

Cooks Inlet—Capt. Neilson has discovered a valuable deposit of anthracite along the Knik River at the northeastern corner of Cooks' Inlet.

Next year Fairbanks will receive coal from the British Yukon, near Five Fingers, where a mine was opened this year by C. J. Milton and other St. Paul capitalists.

RECENT COAL AND COKE PATENTS

Steam Boiler Furnace—Orland D. Orvis, New York, N. Y., 1,071,787, Sept. 2, 1913. Filed Jan. 20, 1911, Serial No. 603,685.

Gas Producer—Emile Dor-Delattre, Leige, Belgium, 1,072,098, Sept. 2, 1913. Filed July 24, 1911, Serial No. 640,182.

Smoke Consuming Device for Fire Boxes—W. D. Boyce, New York, N. Y., 1,071,689, Sept. 2, 1913. Filed May 15, 1912, Serial No. 697,443.

Furnace Door—F. Orth, Indiana Harbor, Ind., 1,071,786, Sept. 2, 1913. Filed Dec. 4, 1911, Serial No. 663,801.

Water Tube Boiler—Wilheim Schmidt, Cassel-Wilhelmshohe, Germany, 1,072,174, Sept. 2, 1913. Filed April 12, 1911, Serial No. 610,540.

Fire Box for Boilers—J. McClellon, Everett, Mass., 1,072,865, Sept. 9, 1913. Filed June 7, 1909. Serial No. 500,562.

Boiler Furnace—Gustav de Grahl, Zehlendorf, Germany. 1,073,039, Sept. 9, 1913. Filed Nov. 20, 1911, Serial No. 661,352.

Stop for Mining Cars—James A. Nolan, Bowerston, Ohio, 1,072,977, Sept. 9, 1913. Filed Aug. 7, 1912, Serial No. 713,938.

Apparatus for Separating Fine Coal and the Waste Materials Thereof. G. B. Damon, assigner to Lehigh Coal and Navigation Co., New York, 1,072,833, Sept. 9, 1913. Filed Aug. 8, 1908, Serial No. 447,630.

PERSONALS

M. G. Doll has accepted the position of general sales manager with the Bury Compressor Co., of Erie, Penn.

Frank Oakes, former general shop foreman of the Chicago works Link-Belt Co., has been made superintendent of their works at Philadelphia.

C. Willis Adams, former superintendent of the Link-Belt Co.'s Philadelphia works, has been transferred to their Chicago works to take up his duties as assistant to the president.

Oscar W. Schnell, general outside foreman of the six collieries of the D. & H. Co. in Larksville Borough, has resigned his position, and Charles Contine, of the Dickson colliery has been selected as his successor.

C. V. Kerr, the organizer of the Kerr Turbine Co., New York, and later with McEwen Bros., of Wellsville, N. Y., is now connected with the staff of the Centrifugal Pump Department of the A. S. Cameron Steam Pump Works.

Anthony Mohr has returned to Portland, Ore., after a five months visit in the coal mines of eastern Oregon in which he is interested. He reports that the development work in the mines in Wheeler county is far exceeding all expectations.

George Gould, breaker foreman at the South Wilkes-Barre colliery of the Lehigh & Wilkes-Barre Coal Co., has been appointed outside foreman at the Parrish colliery of the same company, to succeed John Bresnahan, who recently resigned.

Hywel Davies and W. J. von Borries have entered into a partnership under the firm name of Davies & von Borries as consulting mining, civil and industrial engineers, with offices at 39 Hernando Bldg., Lexington, Ky., and 110 S. 7th St., Louisville, Ky.

C. L. Newcomb, Jr., has been appointed to succeed G. B. Turner as western representative of The Goulds Mfg. Co., Seneca Falls, N. Y. Mr. Newcomb's headquarters will be at 12 Chamber of Commerce, Denver, Colo., and he will look after the company's interest in the Rocky Mountains and Northwestern territories.

M. M. Bardwell, who was formerly located in Louisville as general manager of the coal companies in which Byrne & Speed, of Louisville, are interested, has transferred his offices to the Western Kentucky operation of the Taylor Coal Co. at Beaver Dam. Mr. Bardwell still spends a good deal of his time in Louisville, however.

Elmer O. Long, assistant chief engineer of the Consolidation Coal Co. in Somerset County has tendered his resignation and will engage in business with Frank B. Flick, mining engineer and engineer for Somerset borough. Charles Ling succeeds George B. Glennas general manager of the Sunnyside Coal Co. at Johnstown.

Philip P. Bourne has recently been appointed chief engineer of the Epping-Carpenter Pump Co., with shops at Pittsburg. Mr. Bourne was for eight years, chief of the engineering staff at The Blake-Knowles Steam Pump Works, East Cambridge, Mass. This appointment is in line with other recent activities of the Epping-Carpenter Pump Co., in strengthening their organization and enlarging their business, especially in high duty and centrifugal pumping machinery.

John W. Smith, special disbursing agent of the U. S. Navy with the Matanuska coal mining expedition, was in Seattle recently purchasing horse sleds and other equipment necessary for the transportation of the coal to tidewater, a distance of about 300 miles. It is expected that the entire winter will be spent in moving the coal. There were about 800 tons taken from the experimental mine during the summer. According to Mr. Smith, this will all be aboard the naval ships by June, 1914 ready for its tests.

The Lehigh Valley Coal Co. has announced the following appointments as District Superintendent in the Wyoming Division, to fill the vacancy caused by the death of District Superintendent Joseph J. Jones: J. S. Hammonds, formerly District Superintendent at Henry, Mineral Springs, Franklin and Warrior Run Collieries, to be District Superintendent at Henry, Prospect and Dorrance Collieries; and Sheldon Jones, formerly Asst. District Superintendent at Prospect Colliery, to be District Superintendent at Mineral Spring, Franklin and Warrior Run Collieries.

CONSTRUCTION NEWS

McComas, W. Va.—The Thomas Coal Co. will equip its power station at Mora, W. Va., with new 100-kw. and 200-kw. rotary converters and switchboards, and has ordered the apparatus from the General Electric Co.

Dante, Va.—The Clinchfield Coal Corporation will soon place in operation in its mines eight 5-ton and two 10-ton electric mining locomotives recently purchased from the General Electric Co.

Ellsworth, Penn.—The Ellsworth Collieries Co. has arranged to add to its power-plant equipment a 937-k.v.-a. Curtis turbo-generator unit with 25-kw. turbo-exciter, switchboard panels and accessories. The apparatus will be built and installed by the General Electric Co.

Belmont, Ohio—Belmont Coal Mining Co. is remodeling the outside layout of its Glencoe Mine. The old car haul which extended into the mine was abandoned, and is now being replaced by a shorter and steeper one, which has the advantage of keeping all the machinery on the outside where it is accessible and can be better taken care of. The electric locomotives will now bring the cars out of the mine through an opening made for the purpose, delivering them to a chain car feeder, which feeds them regularly to the chain car haul. The new equipment is being installed by the Fairmont Mining Machinery Co., Fairmont, W. Va.

Elkins, W. Va.—The Davis Colliery Co. is remodeling the tipple at Coalton mine. Preparation is being made for a better grade of lump and egg coal. Shaker screens separate the sizes, delivering the lump and egg coal to separate picking tables. The tables are located over the railroad tracks, running longitudinally with them, and loading into the cars over adjustable booms—thus eliminating breakage. The nut and slack sizes are used for coking. A Bradford cleaner is being installed to improve the quality of these sizes. Contract for this equipment was awarded the Fairmont Mining Machinery Co., Fairmont, W. Va.

INDUSTRIAL NOTES

Bucyrus, Ohio—The recently organized Bucyrus Lumber Co. has taken over the planing mill, coal and builders supply yard of the White Lumber and Coal Co., of Bucyrus.

Oakwood, Ill.—The large new tipple of the Two Rivers Coal Co. at old Missionveld, southeast of this village, is nearing completion, and it is stated that coal will be hoisted here within a few weeks.

Spokane, Wash.—The Summit Coal Co. near the slope mines of the Northwestern Improvement Co. at Cle Elum has been sold to the Roslyn Fuel Company, the consideration being in the neighborhood of $40,000.

Erie, Penn.—The Erie Pump & Engine Works has recently purchased the business, patterns, etc., of the Lake City Engineering Co., of Erie, Penn. The business of the latter firm will be continued under the new management.

O'Fallon, Ill.—All Illinois coal-hoisting records were broken at the Nigger Hollow Mine No. 2, when 4400 tons of coal were hoisted in 7¼ hr.; the previous record being held by a mine at Benld, Ill., which hoisted 4356 tons in 8 hours.

Pittsburgh, Penn.—The H. C. Frick Coke Co. has purchased from the Pittsburg-Buffalo Coal Co. 395 acres of coal land located in Jefferson township, at a consideration of $274,000. The coal underlies 12 tracts of land facing the Monongahela River.

Windber, Penn.—The Berwind-White Coal Co. has closed a deal for the purchase of approximately 2000 acres of coal land owned by the Henrietta Coal Co. adjoining the Berwind-White No. 42 operation. It is likely that an opening will be made in this tract.

Franklin, Kan.—The Western Coal & Mining Co., which is opening up two new mines at this place, has announced that coal has been reached in both. One of the company's new mines at Lexington, Mo., has begun production, while the tipple on a fourth is being built.

Sewalls Point, Va.—The 200,000-ton storage plant of the Gulf Smokeless Coal Co., which has been building for some months, is now completed. It has been given a test, about 500 tons being dumped into the receiving pits and transferred to the storage yard. The plant consists of two 20-ft. concrete receiving pits built in the center of a cleared field. Railroad tracks run across the pits and the coal is dumped from hopper-bottom cars into the pits. After the coal has been dumped, it is dug out by a steam shovel and deposited in the storage yard on either side of the receiving pits.

NEW INCORPORATIONS

Indianapolis, Ind.—The Oak Ridge Coal Co. has been organized with a capital stock of $10,000. Robt. Hall, M. E. Magg and W. E. Linton are the directors.

Indianapolis, Ind.—The Oak Ridge Coal Co. has been incorporated here with $100,000 capital stock, to mine coal. The directors are Robert Hall, M. E. Magg and W. E. Linton.

Minneapolis, Minn.—The British Columbia Collieries Co. has been organized with a capital stock of $500,000. The incorporators are James C. Andrew, George B. Norris, George H. Derry and Walter H. Hickman.

Clarksburg, W. Va.—A charter has been issued to the Norwood Coal Co., with an authorized capital of $10,000. The incorporators are: Karl Horner, Chas. B. Shont, J. Lee Horner, Wm. H. Wolverton and Chas. B. Johnson.

Kewanee, Ill.—The Streicher-Stuhlsatz Coal Co., to conduct mining and construction business, has been organized with a capital of $2000. The incorporators are: John Streicher, John Stuhlsatz, John P. Steeicher and Peter Stuhlsatz.

Bristol, Tenn.—The United Collieries Co. has been organized with a capital of $5,000,000 for the purpose of extensive developments in the Black Mountain coal district. Chas. W. Pondurant is president and manager of the new company.

Charleston, W. Va.—The Horse Creek Block Coal Co. has been chartered, with an authorized capital stock of $100,000. The principal offices of the company will be in Charleston. The incorporators are: G. B. Combs, T. R. Farley, P. R. Hendrick, A. A. Honaker, John Jarrell and G. W. Johnson.

COAL TRADE REVIEWS

GENERAL REVIEW

Hard coal more active as season advances. Companies drawing on their stocks. Soft coal moderately firm with a tendency to decline. Lake shipping about finished.

Seasonable weather conditions have created a demand for hard coal at all the distributing centers, and the trade has attained the greatest activity of the year. The last rush of water shipments to points soon closing to navigation is now on, and there are some anxious phases to the situation. Stove coal continues the leader in demand, and the shortage is becoming more sharply defined as the season advances. While concessions in the circular are occasionally heard of on certain sizes, this is confined almost entirely to shipments threatened with demurrage charges; the market generally is so strong that the companies are already beginning inroads on their storage supplies.

Bituminous coal continues uncertain, with a pronounced wavering tendency, and generally firm, though far from active. The tendency is strongly toward a declining market due to the apathy in general business. Adequate, though not excessive, tonnages are reported at all the large distributing centers, and business is quiet. Contract consumers are showing a disposition to take more on their contracts, however, and it is clear that the more seasonable weather is having an effect upon conditions. The outlook is by no means clear. The opening prices for 1914 are already being discussed, and in view of the possible labor trouble next April, the opinion prevails that a higher level will be established.

An embargo of several days' duration was declared in the Pittsburgh district against Lake shipping as the result of the heavy storm of last week; the tremendous losses by the Lake shipping interests will now make it impossible to move as much coal to the head of the Lakes as was anticipated. Because of the tie-up in transportation facilities there was a temporary urgent demand, manufacturing interests being the worst sufferers, but normal conditions are now about restored. The trade is now face to face with the problem of finding new markets for the Lake tonnages, but with a heavy demand in the West not much difficulty is anticipated. However, the readjustment is being viewed with some uneasiness, particularly because of the rather critical position of the market.

The Ohio market has stiffened up sharply due to the recent storm; Lake shipping has, of course, been badly crippled because of the large number of vessels lost, and a congestion is threatened at some of the junction points. Considerable difficulty is being experienced in getting sufficient coal forward at Hampton Roads to meet contract requirements; shipments have been heavy, and the slow return of railroad equipment from the Lakes is tightening the car supply. Consumers in the Southern market are taking the minimum amounts on their contracts and domestic coal has failed to develop any briskness in spite of the approaching cold weather and uncertain car supplies.

The steam trade in the Middle West is showing improvement, but in spite of the severe weather conditions, the domestic market continues slow. Some storing of coal is already being done in anticipation of possible labor trouble next April.

EASTERN MARKET

BOSTON, MASS.

Hampton Roads coals plentiful, and only a quiet demand. New England consumers accepting deliveries more regularly. Georges Creek and the Pennsylvanias show no significant change. Water freights easy and anthracite showing possibly a milder tone, but with dealers no less anxious.

Bituminous—The Hampton Roads coals are mulling along, $2.85 continuing the price on what few sales there are of spot coal. There is a sufficiency of coal on hand at all the piers, so the dispatch is excellent, although with most of the agencies the coastwise trade is still being relied upon to furnish the more consistent market. Off-shore the demand is better, but so far confined to the larger shippers. In this section business is only quiet. The corporations are accepting deliveries on their contracts rather more regularly than early in the month and the advance of seasonable weather makes a difference. The prospect for December is not clear, however, and there are many who think spot purchases will continue to be made at the season contract price.

Georges Creek is also quiet, but with a normal movement on contract. The same is true of the better grades from Pennsylvania. There is some see-sawing of prices on the latter, the tendency being down rather than up, however, and all hands are still in doubt as to what the season will bring forth. The inferior coals are slow, and those operations that have been imprudent enough to ship on the market are netting some low prices at New York and Philadelphia. The call here for Pennsylvania is only scattering, and there is nothing that signifies any material improvement in the near future. All-rail trade is in about the same situation as the business at tide.

Freights—Rates from Hampton Roads are still easy at 70@75c. on large sailing vessels, with almost no inquiry for steamers. On Long Island Sound, barges from New York have been moving slowly and freights are up 5c. or so.

Anthracite—The last cargoes are now being loaded for Bangor and other Eastern ports that soon will be ice-bound. The demand is strong everywhere, although retail trade is having a temporary lull. The dealers, however, are still anxious about supplies, particularly of stove, and they are beginning to be in a mildly complaining mood. There have been several short interruptions to the movement of tows the past fortnight and that has meant rather slower shipment than would otherwise have been the case. Less is heard of premium coal in New York and there is perhaps an easier tone than a week ago.

Quotations on bituminous are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahonta New Rive
Mines*................	$1.00@1.55	$1.25@1.65	$1.67@1.77	
Philadelphia*..........	2.25@2.75	2.50@2.90	2.92@3.02	
New York*............	2.55@3.05	2.80@3.20	3.22@3.32	
Baltimore*............			2.85@2.95	
Hampton Roads*........				$2.85@2.90
Boston†..............				3.72@3.82
Providence†...........				3.75@3.87

*F.o.b. †On cars.

NEW YORK

Bituminous slow but buyers are quietly accumulating surplus tonnage. Shipments on contracts continue good. Stove coal becoming shorter as the season advances. Most of the hard coals now in short supply.

Bituminous—The New York soft-coal market is in fair condition, but quiet. Consumers, as a rule, are not buying very heavily, but on the other hand, there is the general belief that they want to see more coal ahead at this time of the year. Such a condition is only natural as the appearance of a protracted spell of severe weather would soon wipe out all available supplies, and create a tight situation. It is this uncertainty that is probably the mainstay of the market.

The heavy storm of last week had little effect upon conditions here, particularly as regards Pennsylvania coals; the mines in that district were not in the storm zone, and experienced little or no inconvenience. Car supply on the Pennsylvania R.R., however, tightened up preceptibly toward the end of last week, being reported at only 60% requirements, and showed indications of being inadequate the beginning of the current week. The New York Central is furnishing a full supply. The labor question continues to be a bothersome factor, not so much in the supply, mines having a relatively full complement of men, but finding it impossible to keep them at work steady. The market continues as follows:

West Virginia steam, $2.65@2.75; fair grades of Pennsylvania, $2.75@2.85; good grades of Pennsylvania, $2.85@2.95; best Miller Pennsylvania, $3.15@3.25; George's Creek, $3.20@3.30.

Anthracite—The feature of the New York hard-coal market is the acute shortage of stove coal; the trade seems to be absolutely barren of this grade. Nut coal at the present time is nearly as short as stove, and as a matter of fact, egg is the only grade that can be supplied with any dispatch. This was in short supply a few weeks ago, but has rently become a complete drug on the market. As a rule usiness is quiet, not because of the lack of orders, but due ore to the difficulty in obtaining tonnage.

In the smaller sizes, buckwheats are generally heavy with ne exception of the high grades of No. 1 which are short. ice coal is holding its own, while barley is exceptionally ng. Pea coal continues the leader in the smaller sizes; the rade is expressing the wish that the producers would readjust their preparation so as to increase the proportion of ea coal.

The car supply seemed to be much improved in the region with the exception of the Reading on which the supply is naccountably tight; apparently, however, this applies more articularly on shipments East.

The New York hard-coal market is now quotable on the ollowing basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular*	Individual
Broken	$5.00	....	$4.95	
Egg	5.25	$5.10@5.25	5.20	$5.00@5.20
Stove	5.25	5.25@5.75	5.20	5.20@5.70
Chestnut	5.50	5.50	5.45	5.35@3.45
Pea	3.50	3.50	3.45	3.45
Buckwheat	2.75	2.60@2.75	2.45@2.70	2.20@2.70
Rice	2.25	2.25	1.95@2.20	1.70@2.20
Barley	1.75	1.60@1.75	1.70	1.40@1.70

*An addition of 2½% is required on the prepared sizes in this column to cover the new Pennsylvania state tax.

PHILADELPHIA

Hard coal showing a consistent improvement with demand good on practically all sizes. Stove coal the leader. Companies beginning to lift their storage supplies. Car supply unsatisfactory. Bituminous uncertain.

The close of this week finds the anthracite trade at the highest stage of activity so far this season. Outside of egg coal almost everything is moving off without any special urging. Stove coal has been scarce for so long a period, that it is an old story, and as the winter advances, the shortage becomes more emphasized. Premiums of anywhere from 10 to 25c. per ton are made but notwithstanding the demand, one still hears of concessions on some of the sizes. Demurrage charges at the distributing points in the regions, for cars held over a certain length of time, is doubtless responsible, in some cases, for this condition. It is no doubt a fact that orders flow in more freely some days than others, and when it happens that there is an accummulation of cars that are approaching the danger line, an inducement in the way of concessions from the so called circular, furnishes a prompt disposition. This probably applies more to egg than any other size, as all other coals are moving freely.

Operations at the mines still continue at capacity, and the output is running well ahead of the corresponding period for last year. Coal stocks are already being depleted on certain sizes, particularly pea and chestnut. It is understood that none of the companies have any appreciable tonnage of stove on hand, and what little they had has doubtless been sent to the market. The car supply seems to vary from day to day. One hears of occasional complaints of the shortage and the situation as a whole is not satisfactory.

In bituminous coal the trade seems to grow worse instead of better. Orders are harder to get, but this may be accounted for by the fact that the operators are still holding to the prices that obtained a month or six weeks ago. A disposition to dicker, has a tendency to bring business, consumers seeming to be willing to buy, if they can do so at their price, or a little lower than what the operators are asking. The consuming trade seems to appreciate the unusual situation and are taking advantage of it. From now on, unless conditions change materially, there is likely to be a marked softening in prices, gradual but apparently sure.

BALTIMORE, MD.

The trade still facing a declining market. Complications from blizzard in mining regions. Car movement easy, and exports increasing.

That the coal trade here is still facing a declining market has to be admitted. This is particularly true in the West Virginia and Pennsylvania bituminous fields, due to the cutting off of heavy shipments to the Great Lakes. The steel industry, the cement trade and other branches of business that use considerable quantities of coal and coke, are all more or less flat.

In West Virginia good grade run-of-mine coals had been cut to 90c., while slack is selling about on the same basis, or in some cases a little less. In Pennsylvania, while little good coal can be had at less than $1.20 and $1.25, it is being offered freely at that price, a decided contrast to a few weeks ago when agencies were begging for it at $1.35 and $1.40.

The coke market is also weak, and it will not surprise the trade to hear that a number of important ovens will be banked at any time.

Complications appeared last week as a result of the blizzard-like weather in West Virginia, shipments being delayed four and five days, and all communication with the mine centers being shut off for several days. There were plenty of cars in the region, the only trouble being that the railroads could not move them as desired. Later in the week the car supply and movement was reported good.

The anthracite trade is quiet. Steam sizes are reported in only fair demand and the domestic grades are in best call.

Exports are again increasing, a total of over 60,000 tons having been sent out the past month, against 45,000 tons for September.

BUFFALO, N. Y.

Bituminous dull and unsteady. Free tonnage difficult to place. Uncertainty regarding readjustment of business following the closing of Lake shipping. Effects of the heavy storm.

Bituminous—The status of the trade at the present time is rather uncertain, but it is clear that there is more bituminous coal offering than there is demand for. Where dealers have good contracts behind them, they express complete satisfaction with the situation but the new jobber seeking to place tonnage is finding it difficult to do so. Indications are that the market will not be clearly defined until after the Lake navigation has closed, and the shipments in that business covered in other markets. Lake business has been heavy this season, and the readjustment will be felt.

Prices are steady and difficult to quote, probably being weak at former figures. There is a surplus of coal all over the eastern part of the state, and probabilities are that there will be a decline, although the trade is not of the opinion that even this will help to move the surplus tonnage. The heavy storm of last week delayed the movement from a day or two to a week. Lake shipments were at the same time reduced to practically nothing. The generally adverse weather conditions, however, have been against a good consumption of coal.

We quote the market weak and unsteady at $2.90 for Pittsburgh lump; $2.80 for three-quarters; $2.65 for mine-run, and $2.25 for slack, the last being no longer any firmer than the sizes; Allegheny Valley coal is quotable at about 25c. less.

Coke—Coke has failed to firm up any even at the reduced price quoted last week. The weak situation is said to be due to a conflict between coke and steel interests, and the outcome is dependent upon conditions in the steel industry. Coke is quoted in the local market on the basis of $4.70 for 72-hr. Connellsville foundry.

Anthracite—The heavy storm and snow blockade of last week was of too short duration to have any material effect upon the situation, and although there is a fair demand for hard coal, the weather is still the controlling factor. Retail trade is dull.

The movement by Lake is good, considering the storm, being for the week 126,000 tons. It is about at an end, though, as insurance on wooden hulls expired on Nov. 15, and will not be obtainable for anything after Dec. 1, except at very high rates. The underwriters will not be free to give extensions unless the vessel is especially promising, the Lake storm already having cost them about $5,000,000.

CENTRAL STATES

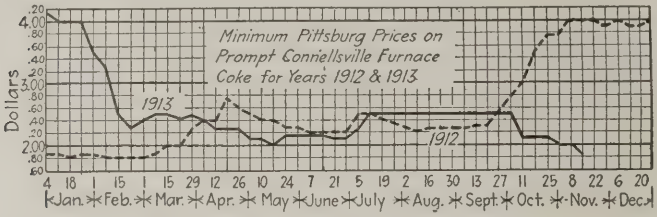
PITTSBURGH, PENN.

Coal movement recovering from effects of storm and temporary scarcity being relieved. Much Lake shipping lost. Connellsville coke stagnant, with consumption decreasing.

Bituminous—While the coal trade has largely recovered from the sudden rush of demand for domestic coal resulting from the storm referred to in last report, the movement of coal is not yet altogether normal as the railroads were seriously affected. In particular, an embargo was on for several days against coal destined for lake shipment as the terminals at Lake Erie docks were in no condition to receive it. The storm did great damage to lake shipping, destroying at least 125,000 to 150,000 tons of vessel capacity, and although little coal was actually lost, it will be impossible to move nearly as much up the lakes as was expected.

Shipments to manufacturing consumers tributary to the Pittsburgh district were much interfered with, and are hardly normal yet. For several days there was an insistent demand for spot coal, and relatively fancy prices were offered, but the market is now back to its old basis. Mines are running fairly well this week, with the car supply improving after what amounted to a blockade, and with a fair supply of men. We quote for short contracts and prompt: Slack, $1@1.25; mine-run, $1.40@1.50; ⅞-in., $1.50@1.60; 1¼-in., $1.65@1.75, per ton at mine, Pittsburgh district.

Connellsville Coke—The market has been extremely quiet the past week, with many more sellers than buyers. Prices have not yielded materially since last report, but it is not improbable that if any important inquiries had come out they would have developed lower figures. Furnaces are going out of blast and consumption is correspondingly declining. No one is taking any interest in contracts for 1914. It is uncertain how many furnaces will run and those that are sure of running expect lower coke prices so that they are not inquiring. We quote: Prompt furnace, $1.85@1.90; contract (nominal) $2.25; prompt foundry, $1.60@1.75; contract foundry, $1.60@1.75, per ton at ovens.



The "Courier" reports production in the Connellsville and lower Connellsville regions in the week ending Nov. 8 at 354,045 tons, a decrease of 21,185 tons, and shipments at 376,479 tons, an increase of 10,933 tons. The preceding week production had been reported as exceeding shipments by 21,000 tons and the excess of shipments over production the succeeding week has improved the situation.

TOLEDO, OHIO

Heavy storm of last week stiffened the market up sharply. Transportation seriously crippled. Lake shipping badly delayed and a number of vessels lost.

The effect of the recent storm on the Great Lakes and sweeping over this section of the country during the past week has been to stiffen quotations here to such an extent that almost any price can be secured for track coal. The railroads have been urging mine shipments of their orders and as a consequence no difficulty in the way of short fuel supply was felt here.

Cars, however, are scarce. There is practically no equipment on track here and the T. & O. C. was for days the only road open, shipments being greatly curtailed over the B. & O. and Pennsylvania lines, and even yet the movement is exceedingly slow. The railroad men declare that the congestion here is no worse than in other years at the same season and some hope is held out that the freight congestion at other points will be better this year. Heretofore the lack of yard space at Detroit has forced embargoes on north bound freight, throwing back on Toledo the burden, not only of its own cars, but of hundreds of freight cars for Detroit and other northern points.

Toledo roads have long been preparing for the handling of a heavy volume of freight, and some of them notably, the Hocking Valley are in fair shape. The Hocking Valley has just received six new Mikado engines which are said to be the heaviest and strongest freight engines ever in use in this section. About Dec. 1 the 1000 new 115,000 lb. capacity coal cars ordered by this road will be delivered in part at least, which will greatly facilitate the movement; these will be the largest capacity coal cars in use in this section.

The demand for both domestic and steam coal has been good although the warm weather of the past few days has had a quieting influence on the domestic market. Prices are firm and holding unusually close to the list. Many large freighters carrying coal and ore were endangered and some went down during the big storm among them the Henry B. Smith, one of the big ore boats recently built; she foundered off Keweenaw Point, carrying down a crew of 28 men and 10,000 tons of ore.

COLUMBUS, OHIO

Sudden cold snap of last week caused a general stiffening in the market. Car shortage still bad and gradually growing worse. Prices ruling firm and inclined to advance. Lake demand still good.

The feature of the coal trade in Ohio during the past week was the storm which covered the state with about a foot of snow and caused a rush of domestic orders. The long expected had come and in most cases the dealers were able to cope with the situation. Their stocks were fair and they were able to make deliveries promptly despite the icy condition of the streets. As a result no shortage appeared in any line.

The storm also had its effect on the railroads and the movement of coal cargoes was slower than has been the case. Drifting snow and ice delayed all trains and as a result the car supply in Eastern Ohio was only about 40 per cent. of normal. In the Hocking Valley the supply was not much shorter than has been the case for some time and 50 per cent. was reported. In the Pomeroy Bend district the shortage was more pronounced and the output in that section was curtailed to 40 per cent. of the average.

There is a good steady sale of steam sizes and many of the manufacturing plants have gradually increased their requisitions. There is also a slight tendency on the part of managers of factories to accumulate a small surplus to guard against a shortage later in the season.

Lake trade is still active, although hindered by the severe storm which caused a falling off in ore movement and boats engaged in the lake coal business will either have to come back light or carry grain. The car shortage is seriously interfering with the lake movement. There is a good demand from the Northwest and the trade will probably continue until Nov. 25 or even later.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump.....	$2.00 @ 1.90	....	$2.25 @ 2.15	$2.00 @ 1.90
3-4 inch...........	1.85 @ 1.75	$1.50 @ 1.40	2.00 @ 1.90	1.85 @ 1.75
Nut..............	1.30 @ 1.20	....	1.75 @ 1.65	1.40 @ 1.35
Mine-run..........	1.50 @ 1.40	1.35 @ 1.30	1.50 @ 1.40	1.50 @ 1.45
Nut, pea and slack..	0.90 @ 0.85	....	1.00 @ 0.90	0.85 @ 0.80
Coarse slack........	0.80 @ 0.75	1.00 @ 0.95	0.90 @ 0.80	0.75 @ 0.70

DETROIT, MICH.

Increase in demand and a like decrease in car supply. Top prices of the season. Hard coal becoming scarce.

Bituminous—The local steam trade still continues active notwithstanding the advance in prices, and it is freely predicted that further increases are in sight. The railroads are finding themselves unable to cope with the situation, the difficulty seemingly being one of inadequate motive power, rather than lack of equipment.

As a result of these conditions operations in all the mining fields of both Ohio and West Virginia are seriously restricted. The sharp fall in temperature last week developed a new vigor in the trade, and dealers are insisting upon prompt delivery. Stocks in the hands of the large wholesalers are light, and prices are stiff and inclined to advance. Some abnormally high prices have been quoted during the past week. The following is approximately the market at the moment:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump.	$1.90	....	$2.25	....	....	$3.00	$2.75
Egg............	1.90	....	2.25	....	....	3.00	2.75
Nut...........	1.65	....	1.85	....	....	....	....
Steam lump....	1.50	....	....	....	....	....	....
¾-in. lump......	1.50	$1.50	1.65	$1.65	$1.65	....	....
Mine-run.......	1.50	1.50	1.50	1.50	1.50	1.75	....
Slack..........	1.00	1.10	0.90	1.00	1.00	....	....

Anthracite—Dealers in hard coal are already experiencing trouble in making prompt delivery. Spot coal is becoming steadily scarcer and the market is strong on this grade.

HAMPTON ROADS, VA.

Demand still heavy on Pocahontas and New River. Shortage of coal at all piers. Gulf Smokeless Coal Co.'s large storage plant at Sewalls Point completed.

Coal shipments from Hampton Roads for the week have been heavy. A large number of the shippers are short and are having considerable difficulty getting sufficient coal forward to take care of contract business. There have, however, been a few spot sales during the week where some of the suppliers have had an excess of their contract requirements. While it is difficult to get exact figures at which sales have been made prices quoted have ranged from $2.85 to $3 although it is hardly likely any sales have been made at the latter figure.

The present shortage of coal at Hampton Roads is due to two reasons. There has been a shortage of cars on one or two of the roads, due to the fact that cars which have been sent out with shipments consigned to the Lakes have not yet been returned. The demand has also been heavy at all piers during the last few days which has cut down the accumulation. The largest shipments during the week as usual have gone to the New England market although there has been one or two small shipments to Southern ports. Foreign shipments have gone to Port of Spain, St. Thomas, Cristobal, Para, Manos, and Santiago.

KNOXVILLE, TENN.

Market in excellent condition. Car shortage. Domestic prices improve with the season. Large cotton crop and industrial outlook good.

The outlook in the Kentucky-Tennessee fields has never been brighter. The Southern Railway has developed an acute car shortage, but operators feel that this is compensated for by a general stiffening in prices. This lack of equipment will also be materially relieved by Dec. 1. All roads seem to be making every endeavor possible to handle everything offered them with the utmost dispatch. This is probably due in a measure to the close coöperation between the roads and the Southern Appalachian Coal Operators' Association.

LOUISVILLE, KY.

Closing of Lake shipping having a detrimental effect on the market. Railroads heavy buyers and are storing coal. Market quiet.

The recent cold snap stimulated the local market materially, but it is still rather weak at the moment. The low temperatures were not of sufficient duration to create a permanent demand. In addition to this, the heavy storms brought the lake shipping to an unexpectedly short termination, with the result that this tonnage has been thrown upon the open market.

The railroads are taking abnormally large tonnages which would seem to indicate that they are doing some storing; a few instances where the roads have confiscated coal en route has also been reported. Car supply is good, no complaints having been heard of in that quarter. Domestic quotations are about stationary, with no advance apparent for some time. The increased schedule announced for the 15th of the month was not put into effect, because of the unsettled condition of the market. Eastern Kentucky block is steady at about $2.35, with block and lump at $2.10, round at $1.50, and nut and slack at 80@85c. Western Kentucky lump is active at $1.35, while mine-run is selling at 90c.@$1 and nut and slack at about 70 cents.

SOUTHERN AND MIDDLEWESTERN

BIRMINGHAM, ALA.

Steam coal quiet, but domestic slightly improved. Both furnace and foundry coke slow and blacksmith coal about normal. Practically no demand for pig iron. Car situation shows no improvement.

This week has brought no decided change either way in steam coal. The demand, other than on yearly contracts, is not brisk; the majority of contracts are taking their regular tonnage, though some of the larger ones have reduced shipments to the minimum. The domestic market is rather a puzzle just now; notwithstanding the fact that cold weather will soon be here, and the prospects for cars not encouraging, the producers are not shipping near the normal tonnage for this season of the year and dealers claim to have sufficient stocks for the time being. A few days cold weather, however, will undoubtedly catch many of them short. Consumers using only a car or two each season are waiting until they are forced to buy.

Furnace and foundry coke are both in small demand. Alabama under normal conditions, ships a large tonnage of furnace coke to Mexican smelters, but due to the present trouble, this demand has been temporarily cut off, until there is practically no Birmingham coke moving to Mexico; this is having a tendency to weaken the local market, but even under such adverse conditions, the price is holding up well. Blacksmith coal is about normal, the demand being satisfactory and prices at $2@2.25 f.o.b. mines. The car situation shows little change over last week. With the usual heavy winter movement, little hope can be held out for much improvement in this line.

INDIANAPOLIS

Domestic grades satisfactory in Indiana, both as to demand and price. Lack of cars interfering to some extent with full running schedule. Screening conditions are not improved.

The domestic coal situation is quite satisfactory to Indiana operators. Those mines having the best coal are running full schedule. The car supply is reported better than the movement, blockades at Terre Haute and Indianapolis being still the cause of complaint. The weather has not been favorable to coal consumption, as there have been only a few days so far where the temperature was near the freezing mark.

The local street-car strike gave the domestic movement a boost; there was talk of a sympathetic strike, which would include the teamsters and those short of coal hurried to get in their orders. Some of the retail yards have not caught up yet, although the strike was settled on Nov. 7. Prices for domestic grades are on a good basis. The top mark has been $2 f.o.b. mines but $1.90 is regarded the high end of the range, anything above that being a premium and causing trouble with contract buyers.

Screenings is still a sore spot with operators; for No. 4 from good coal 60 to 75c. can be done but Nos. 5 and 6 sell down to 40c. No satisfactory explanation is had of this unsatisfactory condition. The factories seem to be taking the normal amounts, so that industrial conditions are not held responsible. It is believed that the screenings trouble has its origin with large public utility concerns in Chicago, who seem to be able to fix prices. There has been no revision of retail prices in this city since Sept. 20.

CHICAGO

Domestic coal soft, but the steam market situation is more favorable; many steam users and railroads buying for storage purposes. Smokeless firm. Strong demand prevails for splint with the supply short. Hocking 1¼-in. lump sells at $3.65, f.o.b. Chicago.

Despite colder weather, blizzards in certain coal mining regions and an interruption of traffic, the domestic market in Chicago remains soft. Conditions in the steam trade, however, are more favorable, although it cannot be said there has been any boom.

In an effort to keep their forces at work the operators are turning out steam in preference to domestic sizes. In view of the fact that the agreement between the Illinois operators and miners expires next spring and a cessation of work is expected to follow, many of the larger railroads and steam users are laying by a supply of storage coal. The Chicago & Alton road has arranged to store 75,000 tons of steam coal. Prices for smokeless coal remain firm. Small lots of mine-run are selling at $1.50, with larger quantities on the basis of $1.40 when the coal is on track. Lump and egg command $2.50 in the country and $2.25 in Chicago, with the supply and demand remaining about equal.

Springfield operators are catering to the steam trade and are disposing of much of their product on long-time contracts. Steam lump is selling at $1.25, the mines, while domestic lump is quoted at $1.75. Carterville lump, egg and No. 1 washed is steady at $2, the mines, despite the presence of factors that have tended to disturb prices. The price of Hocking inch and a quarter lump, f.o.b. Chicago, is $3.65 and is a result of an advance to $2 at the mines. Comparatively few shipments are reaching here on account of a tie-up in transportation due to the recent storm. Prices for Indiana coal vary between $1.75 and $2, the mines. High grade, large-sized screenings sell at from 70@90c., the better grades at from 50@75c. and the low grades at from 30@40c. There has been little change in prices for coke.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump............	$2.57	$3.05@3.30	$2.52	
Steam lump..............	2.07		2.07	
Egg.....................		3.05@3.30		$4.30@4.45
Mine-run................	1.92	2.40@2.55	1.87	3.45@3.55
Screenings..............	1.12@1.22	1.55@1.80	1.47	

Carterville prices are: Lump, egg No. 1 washed, $3.05; No. 2 washed, $2.80.

Harrisburg quotations are: Domestic lump and egg, $3.05; steam lump, $2.65@2.80; mine-run, $2.40@2.55; screenings, $1.55@1.80; No. 1 nut, $3.05; No. 2 nut, $2.80.

Coke—Connellsville, $5.50; Wise County, $5.25@5.50; by-product, egg, stove and nut, $4.90@5; gas house, $4.90@5.

ST. LOUIS, MO.

Market unsatisfactory. No demand for domestic and steam business demoralized. Car shortage the only condition that is maintaining prices.

Instead of getting better the past week, conditions grew worse, mainly on account of the weather. Last week started off well but other parts of the country got the winter weather that St. Louis was promised.

The steam market is in a demoralized condition, and domestic is about the same. In some parts of the Standard field screenings are being given away practically for the freight, and the Carterville market seems to be getting weaker all the time. With Standard screenings at say 10c. a ton and 2-in. lump at $1.10, it is easy to figure out what the Standard operator is making when 40% of his product is screenings and the cost of production is about 80c. or more. In the Carterville market the domestic sizes dropped to 25c. a ton and it also affected Franklin County coals much the same.

The demand for anthracite has eased up considerably, although there is a fairly good tonnage moving in. Coke is rather plentiful with no great demand. It is strictly a jobbers' market now and they are trying to keep the prices up. The same thing applies to smokeless, with plenty moving in and no unusual call.

The prevailing market is:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	**Standard**
2-in. lump	....	....	....	**$1.05@1.15**
3-in. lump	....	....	$1.50	....
6-in. lump	$1.75 @ 1.90	....	1.60	1.25@1.35
Lump and egg	1.85 @ 2.15	Over sold	....	....
No. 1 nut	1.40 @ 1.50	....	....	....
Screenings	0.40 @ 0.50	....	....	0.10@0.20
Mine-run	1.10 @ 1.20	....	....	....
No. 1 washed nut	1.75 @ 1.85	....	1.40	....
No. 2 washed nut	1.40 @ 1.50	....	1.60	....
No. 3 washed nut	1.15 @ 1.25	....	....	....
No. 4 washed nut	1.00 @ 1.10	....	....	....
No. 5 washed nut	0.45 @ 0.55	....	....	....

OGDEN, UTAH

Warm weather prevailing throughout Western Territory. All mines in Wyoming and Utah receiving plenty of cars. Mild weather in Colorado delaying coal shortage.

The operators are commencing to worry on account of the fine fall weather that is prevailing throughout the Intermountain territory. The mines in Wyoming and Utah are able to produce a large tonnage of coal when working at full capacity and with mild weather prevailing they are catching up rapidly on their orders. The sugar factories are consuming the slack and steam coal produced which is of great assistance to the mines. Owing to the lack of a severe car shortage this fall the production of steam and slack coal has been above normal, and the factories have not been troubled with their usual coal shortage.

Quotations are as follows:

	California	Colo. & Neb.	General
Lump	$3.00@3.50	$3.00	$2.75
Nut	2.50@3.00	2.50	2.25
Mine-run	1.85	1.85	1.85
Slack	1.00	1.00	1.00

PORTLAND, ORE.

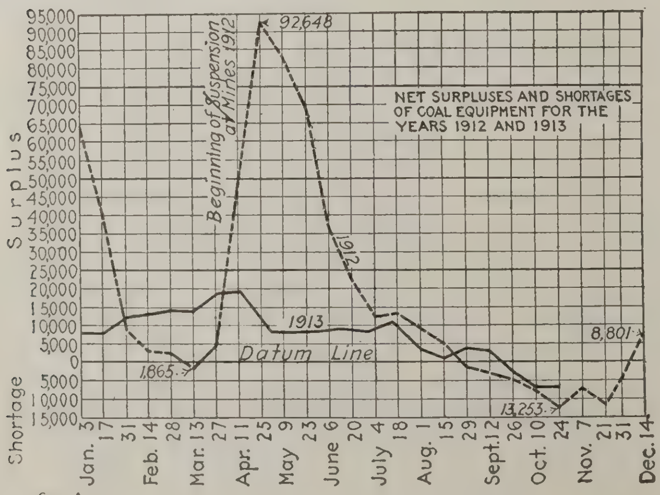
Ship arrives from Australia with 900 tons of coal intended for West Coast of South America. Another vessel due to arrive here soon with 1000 tons from the Antipodes. Retail business active.

The British ship "Segura" has arrived from Australia by way of Salaveri, Peru, with 900 tons of coal. The shipment was not intended for this port, but the ship was caught in a storm while discharging at the South American port's open roadsted and had to cut loose. The cargo was immediately sold here at a somewhat reduced price, but the coal will be retailed at $10.50 per ton, the ruling quotation on Australian coal here at this time. Another shipment of 1000 tons will arrive on a sailing vessel from Australia in a few weeks. This so far as now known, will be the extent of importations from Australia here this fall.

PRODUCTION AND TRANSPORTATION STATISTICS

THE CAR SITUATION

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended Nov. 1, as follows:



COAL AGE

FOREIGN MARKETS

GREAT BRITAIN

Nov. 7—Admiralty List coals are almost unobtainable for prompt positions, while Monmouthshire large coals are also scarce and dear. Buyers continue to adopt a waiting policy in regard to forward loading. Prices are approximately as follows:

Best Welsh steam	$4.80@4.92	Best Monmouthshires	$3.92@4.14
Best seconds	4.56@4.68	Seconds	3.72@3.90
Seconds	4.38@4.50	Best Cardiff smalls	2.58@2.64
Best dry coals	4.32@4.56	Seconds	2.34@2.46

The prices for Cardiff coal are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, exclusive of wharfage, and for cash in 30 days.

COAL SECURITIES

PRICES OF MINING SUPPLIES

MARKETS IN GENERAL

In the face of much adverse news, and in spite of many unfavorable factors, the situation has improved at bottom. The belief that a dollar will be more valuable at a later date has resulted in a stoppage of many enterprises.

There has been a decided falling off in the volume of business, which would indicate that the slowing down has become even more pronounced. This is natural. Conditions grow worse, and are apparent to those guiding affairs, before they are felt in the actual business field.

The iron and steel industry of the country is slowing down gradually, and pig iron is being produced at the rate of 78,000 tons daily, compared with 92,000 tons daily, early in the year. The unfilled orders of the U. S. Steel Corporation fell off 500,000 tons during the month of October, and are now 3,500,000 tons less than at the beginning of the year. Prices have slowly crumbled.

The crop situation shows an improvement. The government reports Nov. 10, indicated a gain of 100,000,000 bu. in corn, and a gain in reserves on the farms of over 60,000,000 bu. Other crops have been as satisfactory as could be desired.

The metal situation continues to show a restriction in the trade. Sales of copper are offered at marked concessions from the high figure in September and stocks are accumulating.

The award of an increase in wages of 7% to the railway trainmen was not a surprise, and the recommendations made by the arbitrators that something must be done to secure more revenue for the railways, was a somewhat unexpected concession. In all, the 41 railways in the eastern part of the United States will pay out about $6,000,000 more per year in wages, and the probabilities are that some increase in rates will be allowed. This, of course, will quickly be reflected in the iron and steel market where the railways are extravagant spenders.

Financial conditions have improved. Many cities which were unable to float their bonds early in the year have now been able to secure the funds needed for improvements, and even for some less judicious expenditures. A distinct gain has been made in municipal bonds, but railroads and industrial companies are unable to finance any new propositions. Monetary affairs abroad, moreover, show an improvement, and American bankers can, if they wish, secure help from Europe. The idle cars of the railways have all been put to work, and for a short period, more rolling stock could have been advantageously used. At one time, railways were short 6000 cars.

Labor disturbances have been far less frequent.

LABOR

The most important announcement in the labor world was that the railway trainmen on Eastern roads will secure an advance of approximately 10% in their wages. At the same time, wages were standardized. The Board of Arbitrators, however, refused to grant the request of trainmen relative to overtime, but indicated that such a matter might come up at a later conference. There have been few strikes of importance during the month, and for the most part, the attention of men has been drawn to securing positions, particularly as some of the larger employers of labor have been drastically curtailing their forces. The Baldwin Locomotive Works has reduced its force of 3000 men or more, about 15% and several firms have gone on part time. A severe car strike occurred in Indianapolis, machinists in Baltimore are striking, and labor troubles in the upper Michigan peninsula are steadily growing better. The strike of the trainmen on the Southern Pacific has been brewing for several months. Railroads have no difficulty in securing men for outside work, and factory hands are easy to obtain.

Immigrants arriving in this country the first 9 months of this year numbered 1,053,220, compared with 747,006 in the corresponding period last year and 595,736 in 1911.

IRON AND STEEL PRODUCTS

An unexpectedly large decrease in the unfilled orders of the United States Corporation in the month ending Oct. 30, unfavorably affected sentiment. This was followed by renewed weakness in the pig-iron market, and a steady falling off in orders for finished products. Most of the retarded business is due to the absence of railway buying, for practically all of the roads in the eastern states are awaiting the outcome of the request for an increase in rates which was recently made to the Interstate Commerce Commission. The only line of steel products in which there has been any semblance of activity is in steel shapes. Here the demand is good, due to the new subway construction in New York. There has been a large amount of material ordered for this and other jobs which will keep the mills actively engaged next year. In spite of numerous efforts on the part of foreign manufacturers to secure business in this country, no sales are reported except for deliveries on the Pacific Coast. The situation as regards scrap steel is particularly disquieting, as prices continue to decline, and there is practically no inquiry. In almost every line, there have been concessions in price granted during the month, and in no particular commodity does it appear that the bottom has been reached.

Pig Iron—Sentiment in the iron trade is more mercurial than in almost any other line of trade, and, just at present, every one connected with the industry feels that the trade is in for a period of declining prices and lessened production. It is not difficult to secure tangible evidence on the subject, for iron is selling at from $3 to $4 a ton less than a year ago, and the blast furnaces of the country are turning out 72,000 tons of pig iron each day, instead of 92,000 tons only a short while ago. Many seem to think that the country will go back to a production of 16,000,000 tons as was the case prior to 1906, but if such is the case, it will upset all precedent. Another factor which has not been given the consideration it should receive, is the statistical position; neither the producers of pig iron nor the consumers have any large stocks on hand and they are not going to permit any to gather. After the brief period of activity in 1910, all the pig-iron interests had a much larger stock of iron on hand than they should have had, and consumers, too, believed at that time that there was to be no limit to the demand for finished products, and so bought most liberally. Now all has been changed, everyone in the trade, and consumers as well, have known for more than a year that a revision of the tariff was probable, and they have been trimming their sails accordingly. Some of those in the trade best qualified to judge are of the opinion that there will be no concentrated buying movement for some time, but they are likewise of the opinion that prices are not far from the bottom.

Quotations for lots of fair size at the points named are as follows: Southern Foundry No. 2 Cincinnati, $13.75@14.25, a decline of 50c.; Southern Foundry No. 4 Cincinnati, $12.75@13.75, a decline of 50c.; Northern Foundry No. 2 Chicago, $15@15.50; Bessemer iron in Pittsburgh is $16.15, which price includes the 90c. freight rate from the valley, and is a decline of 50c. from last month; No. 2 Southern Foundry is $10.50@11.50 in Birmingham, a decline of 50c.

Steel Rails—Some of the smaller railways have purchased moderate lots, and an especially desirable order was received from the Louisville & Nashville. None of the large railways has intimated any likelihood of placing orders in the near future, and it has been more or less officially stated that the Pennsylvania and New York Central would not put out any orders until the early part of next year. These roads will probably require just as many rails for 1914 as they did in 1913; but it is the general policy of the railway companies not to make any commitments not absolutely necessary, until more definite news is at hand, relative to the increase in freight rates.

Quotations are unchanged, $28 per ton for standard section of bessemer rails, and $30 per ton for openhearth rails, f.o.b. Pittsburgh. These prices represent a quotation of $1.25 for 25- to 45-lb. rails, and $1.20 for 16- to 20-lb. rails, in Pittsburgh. In Chicago 16- to 20-lb. rails are quoted at $1.30, 12-lb. rails, $1.33. Relaying rails in Chicago are still held at $24 per gross ton, and in New York at $22.

Track Supplies—Few orders have been placed, and these of small lots. Prices have apparently reached bottom for the present, and there is no cutting for the quotations of last month, which are repeated as follows: Price in large lots f.o.b. Pittsburgh, $1.75@1.80; small lots, $1.90@1.95; in Chicago,

$1.95. Track bolts with square nuts are $2.15@2.25, and angle bars $1.50. All of these quotations are per 100 lb.

Structural Steel—Business is more active than in anything else in the iron-steel line, and there is a likelihood that the mills will be very actively engaged next season, also the fabricating shops. In New York City alone, there will be more work next year than for a number of years past, including such structures as the new Hell Gate Bridge, Equitable Building on lower Broadway, and a great amount of steel for Subway work. General building is inactive, and bids fair to continue so next year, especially in the Eastern cities. On the other hand a great deal of steel is taken in San Francisco and Pacific Coast cities, most of which will come from the East. There are also several large manufacturing plants in the East, which will call for steel construction. The price of fabricated and erected work continues unusually low. Structural shapes are cheaper than a month ago, being quoted at $1.30@1.35 Pittsburgh, for large lots. In Chicago, the price is $1.48@1.53; these quotations are for large lots.

Pipe—Business contiuues fairly active, and in line pipe, there has been specially good demand. The continued decline in raw material and other steel products is responsible for lower prices being named on pipe, which announcement was made at the end of October. This amounts to about $2 per ton, but, however, it affects only pipe larger than 2½ in., internal diameter. It would not be surprising to those in the trade if a further reduction in quotations were made, especially in the smaller sizes, for this trade seems to be stimulated. The following quotations is for fairly large lots, f.o.b. Pittsburgh:

	Black	Galvanized
¾- to 2-in. steel butt welded.........	80%	71½%
2½- to 6-in. steel lap welded..........	78%	69½%
7- to 12-in. steel lap welded...........	75%	64½%

At these discounts the net prices of pipe per foot at Pittsburgh are as follows:

Diameter	Cents		Diameter	Cents	
	Black	Galvanized		Black	Galvanized
¾-in........	2.30	3.26	5-in........	30.50	45.00
1-in.........	3.40	4.83	6-in........	42.25	58.25
1¼-in.......	4.60	6.60	7-in........	59.50	85.00
1½-in.......	5.50	7.90	8-in........	62.50	89.00
2½-in.......	12.90	17.80	10-in.......	$1.03	$1.46
3-in.........	16.80	23.30	11-in.......	1.13	1.64
4-in.........	23.00	33.20	12-in.......	1.27	1.82

Sheets—Prices have again declined $2 per ton, and the old story is heard that mills cannot make a profit at these prices and buy sheet bars in the open market. It has been several years since prices have been quoted as low as this, and it is doubtful if these prices will last for any length of time. Most of the mills are refusing to make contracts for delivery after Apr. 1 of next year at these figures. Some of the smaller mills are operating to only about 50% of capacity, and others have 65% of their mills going. Sales have been made as low as 2c. Pittsburgh for No. 28 black, but most of the business has been done at 2.05c. Other quotations are as follows:

SMALL LOTS IN CENTS PER POUND

	Pittsburgh		Chicago	
	Black	Galv.	Black	Galv.
Nos. 22 and 24..................	2.55	3.35	2.50	3.30
Nos. 25 and 26..................	2.60	3.50	2.55	3.45
No. 27	2.65	3.75	2.60	3.70
No. 28	2.70	3.80	2.65	3.75

WIRE PRODUCTS

Wire—Quotations have been cut without, however, stimulating very much buying. As stated, the heavy buying season is over and less business was booked this year than for a number of years past. The quotations are as follows: Pittsburgh painted barb wire to retailers in less than carload lots, $1.70; galvanized barb wire, $2; plain wire, $1.40; in Chicago plain wire is $1.60; painted barb wire, $1.80; galvanized barb wire, $2.10. All of these quotations are per 100 lb.

Wire Rope—Prices are cheaper, due to threatened competition from abroad. There is very little new business. Quotations are lower as follows: for bright cast-steel wire rope, 2½-in., 76c.; 2-in., 50c.; 1½-in., 29c.; 1-in., 14c.; ¾-in., 9c. All of these are per foot.

Copper Wire—The market is nominal, and no large new business has been placed in some time. The quoted price is 17¾c., but there is likely to be a downward adjustment very shortly.

METALS

Copper—Prices have declined steadily, since the last report, with a very small volume of business. Some of the independent sellers have offered electrolytic at 15.25c. and while the largest interests continue to ask 16c., there has been no business transacted at this figure. It is evident that consumption has fallen off materially and most of the demands for the next 60 days have been fairly well covered. Abroad the situation is fully as unsatisfactory, for, there has been a decided falling off in the volume of business in both Great Britain and on the Continent. The statistical position is about as satisfactory as could be desired from the producers' standpoint, and as they have impressed this fact upon possible buyers whenever the occasion offered it is perhaps well to suggest that there is always a turn, and statistics reflect past rather than future conditions. Those in a position to judge the market are of the opinion that quotations are more likely to decline than to advance.

Tin—For the first time in a number of years, an increase in the visible supply of tin has been shown in the reports. Stocks in the U. S. are larger than usual, and the demand is falling off. The price of tin has declined, whether on account of the statistical or other causes, it is difficult to conjecture, but in any event sales have been made at under 40c.

Lead—The market is firm, and sales of large lots are made at 4.35c. New York and 4.20c. St. Louis.

Spelter—While the demand is light, prices continue steady at 5.35c. New York.

Solder—Prices have declined and strictly ½ and ½ solder can be had at 25 to 25½c.

HARDWARE

Nails—Business has been quiet, as the mills are not aggressively seeking orders at these levels, and consumers do not care to make commitments at this time. Wire nails are held at $1.75 Pittsburgh and $2.05 New York, in kegs of 100 lb. and in large lots to consumers, but for small lots from jobber's store, $1.95 is quoted in Pittsburgh and $2.15 at New York.

Iron and Steel—Prices of shapes and angles from jobber's stocks have not declined as much as the mill prices, but this is explained by the very good demand for goods from store as many consumers are buying small lots, so as not to load up with the large shipment from the mill with a dull season ahead. Most of the prices given below, which are for warehouse delivery in Chicago and other distributing centers, are $2 per ton below those quoted last month:

	Per lb.
Refined iron:	
1 to 1⅞ in., round and square......................	2.00c.
1½ to 4 in. x ⅜ to 1 in............................	2.00c.
1½ to 4 in. x ¼ in. to ⁵⁄₁₆ in........................	2.20c.
Norway bars	3.40c.
Soft steel:	
¾ to 3 in., round and square.......................	2.00c.
1 to 6 in. x ⅜ to 1 in..............................	2.00c.
1 to 6 in. x ¼ and ⁵⁄₁₆ in...........................	2.10c.
Rods—⅝ and ¹¹⁄₁₆ in................................	2.10c.
Bands—1½ to 6³⁄₁₆ in. to No. 8......................	2.30c.
Beams and channels—3 to 15 in.......................	2.05c.

MISCELLANEOUS

Portland Cement—The portland-cement business is far less active than at any time this year. Some of the largest manufacturers have important contracts to carry over well into next year, but the small concerns have not as good an outlet for their product, and it would not be surprising if there were a cut in the East, which would bring the price down 5 or 10c. per barrel. There has been a reduction in the West of 5c. per barrel, and it is likely that a further reduction will be made before spring. The market is not at all active and seems very weak. Prices are as follows:

Boston, $1.32, not including package.
Pittsburgh, $1.20, not including package.
Chicago, $1.25 f.o.b. not including package.
Cleveland, $1.30, f.o.b. not including package.
Detroit, $1.29, f.o.b. not including package.
Minneapolis, $1.40, f.o.b. not including package.
St. Paul, $1.40, f.o.b. not including package.

Bars, Concrete Reinforcing—The full extent of the lower quotations made in other lines of iron and steel has not been felt in the bar market. The base price for ¾-in. bars, in large lots f.o.b. Pittsburgh, is 1.40c., and for warehouse shipments, 1.85c., but it is not improbable that a large order would bring lower figures. The following prices are f.o.b. Pittsburgh:

	Cents per pound	
	Mill shipments	Warehouse stock
¾-in. and larger............	1.40	1.85
⅝-in.	1.45	1.95
½-in.	1.60	2.15
⅜-in.	1.70	2.25
¼-in.	2.00	2.50

Brattice Cloth—Prices have stiffened up surprisingly in the last six weeks, and practically all the benefit of the tariff concession has been lost. Prices have advanced fully 15%, and are now just as high as before the tariff went into effect. The demand is excellent, as this is the heavy consuming season of the year. Deliveries from abroad are slow, but there is still a fair stock in the United States.

COAL AGE

DEVOTED TO COAL MINING AND COKE MANUFACTURE

Volume 4, No. 22
Issued Every Saturday
Hill Publishing Company

NEW YORK, NOVEMBER 29, 1913

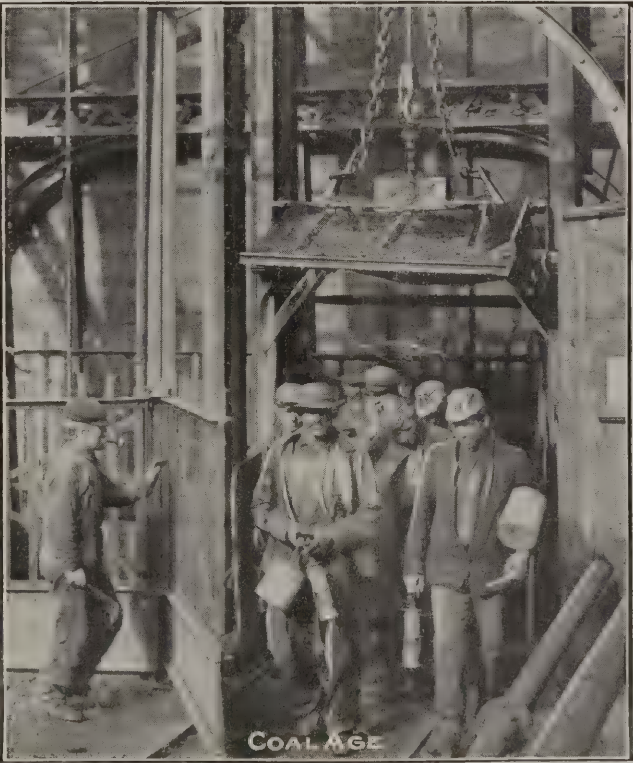
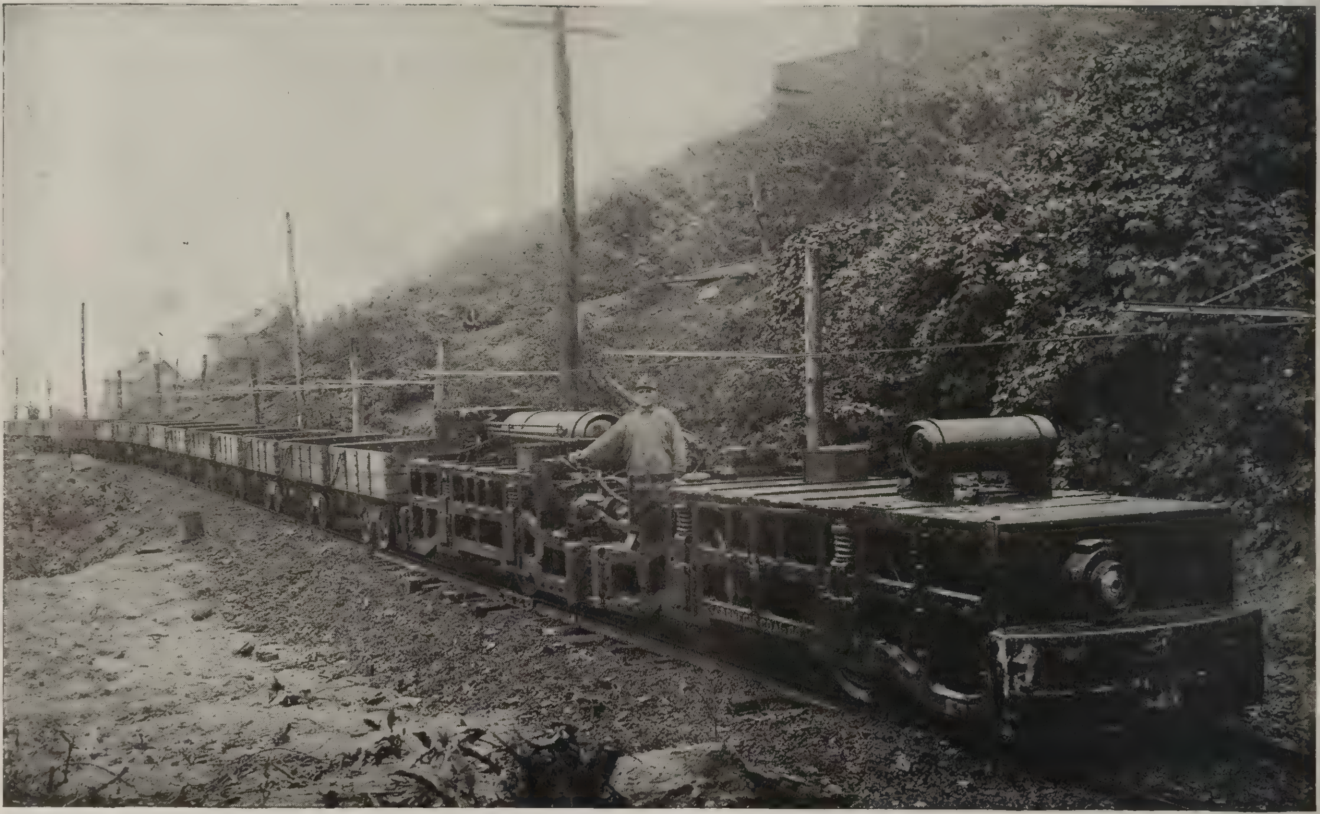
Manifold Mine of Youghiogheny & Ohio Coal Company, Franklin Co., Penn.



Miners coming out of Cage at the Manifold Mine.



Two Units in Tandem, used as a 30-Ton Locomotive.

The Largest Mine Locomotive That Has Ever Been Built

was recently installed at the mines of the Charleroi, Pa., Coal Works. This locomotive (*Baldwin-Westinghouse Barsteel type*) weighs 30 tons, and, it is estimated, can haul 100 cars, each loaded with three tons of coal, over the local grades, which are two miles long and largely against the load.

The locomotive consists of two units which can be separated and used as 15 ton locomotives if desired.

The use of two units in tandem distributes the weight over 8 wheels instead of 4, and hence the locomotive has great tractive power and also is easier on the track than if the weight were more concentrated.

The **Barsteel** frame construction gives ready access for inspecting, oiling, replacing brake shoes, adjusting brake rigging, etc., and also allows excellent ventilation to the electrical apparatus.

If you want to get out maximum tonnage at the least expense and in the shortest time ask for the advice of our mining experts.

One Unit, used as a 15-Ton Locomotive.

VOLUME 4 NOVEMBER 29, 1913 NUMBER 22

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 799

A suggestion that it is better to have schools and churches in mining communities, organized and maintained by the miners and their families on their own initiative. Experience has shown that when a coal company builds and maintains a school house for its employees, the men become suspicious of its teachings. COAL AGE, Vol. 4.

THEORY REGARDING PROCESS OF COAL FORMATION: *Pages* 800-801

Anthracite is quite usually regarded as a bituminous coal which has been subjected to a great heat. Dr. Bergius, however, all but proves that it is the result of extreme pressure, that it may be formed from bituminous coal at a far lower temperature and in shorter time than soft coal is developed. COAL AGE, Vol. 4.

*TENNESSEE'S STATE COKE PLANT AT PETROS: *Pages* 801-802

Brief description of coke operation owned by a state government. The plant is located in the Brushy Mountain field. The author gives some valuable cost data on construction and operation. A. W. Evans. COAL AGE, Vol. 4.

*SHAFT SINKING UNDER DIFFICULTIES: *Pages* 803-804

In the western part of the Pocahontas field great difficulty is experienced in reaching the coal measures on account of the amount of water encountered. This article describes how some of the principal obstacles were overcome and a good rate of sinking attained. Charles A. Hirschberg. COAL AGE, Vol. 4.

POWER-PLANT DEPRECIATION: *Page* 804

THE EVERYDAY HERO: *Page* 804

Poem by Berton Braley.

*THE CAPE BRETON, NOVA SCOTIA, COAL FIELDS: *Pages* 805-806

The fields of Cape Breton were probably the first exploited on this continent. The coals have about the same fuel ratio as those of the Fairmont, W. Va., coals. The recent lowering of the coal tariff raises the question whether this Nova Scotia coal may not regain its former place in the New England market. COAL AGE, Vol. 4

DISCUSSION OF MINERS' COMPENSATION LAWS: *Pages* 807-810

Features of the Oregon and Washington laws discussed in relation to the need in Montana and compared with the experience in Illinois. Relation of compensation to the insurance plan. Disadvantage of the general fund idea. The compulsory feature of compensation—its need, and objections thereto. COAL AGE, Vol. 4.

EXAMINATION QUESTIONS WITH ANSWERS: *Page* 829

COAL AND COKE NEWS: *Pages* 830-833

PROGRAM OF COAL-MINING INSTITUTE OF AMERICA: *Page* 811

WILKES-BARRE DISTRICT MINING SCHOOL: *Page* 811

SNAPSHOTS IN COAL MINING: *Pages* 812-813

Miscellaneous views of surface and underground equipment, gathered from all parts of the world.

A DEFENSE OF THE FLAME SAFETY MINE LAMP: *Pages* 814-816

The safety lamp has probably been blamed for disasters in which it had no part, and other causes of accident have been overlooked to the detriment of the one agent which satisfactorily determines the presence of gas and its quantity. E. A. Hailwood. COAL AGE, Vol. 4.

THE COAL STRIKE IN COLORADO: *Pages* 816-818

Conclusions arrived at by the editors of Colorado's leading newspapers after an extensive and impartial investigation of the labor situation in the coal fields. Four of the six principal demands made by the miners are approved by the press representatives. COAL AGE, Vol. 4.

*EXPLOSION AT ACTON NO. 2 MINE, ALABAMA: *Pages* 819-821

The explosion, though severe enough to frightfully mutilate several men, did not even stop the fan. No fire resulting, the air current greatly assisted the work of rescue. The explosion is attributed to use of black powder and shooting off the solid. COAL AGE, Vol. 4.

EDITORIALS: *Pages* 822-823

The Formation of Coal—Mining Classes and Schools—The Underpaid Miner.

SOCIOLOGICAL DEPARTMENT: *Pages* 824-825

A Declaration Of Principles

The Weekly Ad-Talk Page

The selling section of your technical paper is nowadays ruled by the same Service Principles that govern the reading pages.

"Serve the reader" is the slogan of the entire paper, reading and advertising sections.

In the recent convention of the Federation of Trade Press Associations, the question of better advertising service, so that the reader will be able to reap greater benefits from the advertising section, received as much and as careful consideration as the ever-important question of the right editorial service.

Advertising service, in fact, was so linked with editorial service in the discussions, that the declaration of principles adopted at the close of the convention was made to cover both ends.

You, the reader, are entitled to the best the editors can give, and the advertisers are rapidly coming around to that point where they realize that they, too, must give you the best they have in order to receive your business consideration.

You are interested in the things that are being done to make your advertising pages more valuable to you—as well as your reading pages—so we print in full the Declaration of Principles adopted by the business press of America.

The Federation of Trade Press Associations in the United States in eighth annual convention assembled at the Hotel Astor, New York, September 19, 1913, made the following declaration of principles:

1. We believe the basic principle on which every trade paper should build is SERVICE—service to readers and service to advertisers, in a way to promote the welfare of the general public.

2. We believe in TRUTH as applied to the editorial, news and advertising columns.

3. We believe in the utmost frankness regarding circulation.

4. We believe the highest efficiency of the Business Press of America can be secured through CIRCULATIONS OF QUALITY, rather than of quantity—that character, and not mere numbers, should be the criterion by which the value of a publication should be judged.

5. We believe in CO-OPERATION with all those movements in the advertising, printing, publishing and merchandising fields which make for business and social betterment.

6. We believe that the best interests of manufacturers, the business press and consumers can be advanced through a greater interchange of facts regarding merchandise and merchandising, and to this end invite co-operation by manufacturers and consumers.

7. We believe that the logical medium to carry the message of the manufacturer directly to the distributor and the user is the business press.

8. We believe that while many advertising campaigns may profitably employ newspapers, magazines, outdoor displays, etc., no well-rounded campaign seeking to interest the consumer or user is complete without the business press.

9. We believe in co-operating with all interests which are engaged in creative advertising work.

10. We believe that business papers can best serve their trades, industries or professions by being leaders of thought; by keeping their editorial columns independent of the counting room, unbiased and unafraid; by keeping their news columns free from paid reading notices and puffery of all kinds; by refusing to print any advertisement which is misleading, or which does not measure up to the highest standards of business integrity.

COAL AGE

Vol. 4. NEW YORK, NOVEMBER 29, 1913 No. 22

Said a superintendent: "When the good ladies of our community decide that they need a new church building or school house, I become interested and offer them encouragement. When they come to me with a request to head the subscription list (and an impression that I am good for at least one-half of the total), I remind them tactfully of the proverb which teaches that 'when an ass bears too light a load, he wants to lie down.' "

Churches are beginning to realize that it is important to have each member contribute something; the person who fails to make a contribution, generally fails to take much interest in the work, or bear any of the responsibility. It's pretty much that way with all organizations, charitable, religious or what not.

Company-maintained schools and churches are far better than no schools or churches, but they cannot compare in enthusiasm and efficiency to the ones that are organized and maintained by the miners and their families, on their own initiative. In any camp where 90 per cent. of the married men contribute to the school fund, you'll probably find at least 90 per cent. of the children attending school. It is seldom that a man will contribute to a school and then help his boy to play "hookey."

Those of you who live in states where public schools are independent of individual subscription, but require strict truancy laws to maintain their attendance, will be agreeably surprised, if you ever have the opportunity to visit some of these mining-camp schools, in less-favored communities. There are other reasons than the money interest to account for the popularity and success of these mining-community institutions

If a state or county maintains a school, or a company builds a school house for its employees and expects the superintendent to look after it, the men become suspicious of its teachings (thanks to our Socialistic brethren) and resent its influence. Miners as a class are somewhat suspicious and the slightest hint that some one is trying to influence them, for better or for worse, meets with instant rebellion.

Recall the opposition met with by the progressive superintendents who attempted to introduce safety explosives without first obtaining the approval of the miners, and you can realize what some of these same superintendents are now up against, who are endeavoring to persuade employees to send children to school houses built at company expense, under company supervision.

The influence of the schools and churches, organized and maintained by workers, is manifested in many different ways. We once knew of a camp where four miners' families persuaded their men folks against moving to another camp, because they had a $25 interest each, in a church organ. If your boy had solicited subscriptions for a school building and raised $150 don't you think he would offer some objection if you wished to move to another camp?

Moral: Encourage the wives and the children, Mr. Superintendent, to solicit your name last.

Theory Regarding Process of Coal Formation

SYNOPSIS—Anthracite is quite usually regarded as a bituminous coal which has been subjected to great heat but Dr. Bergius tries to prove that it is the result of extreme pressure, that it may be formed from bituminous coal at a far lower temperature and in shorter time than soft coal is developed. His tests also show that in the change a large percentage of methane is formed, whereas, where the coals are bituminous, the principal gas distilled is dioxide of carbon, the free hydrogen in each case being about the same. Thus we are advised against regarding anthracite as the ultimate outcome of all bituminous coals, the differentiation only taking place under extreme compression and moderate heat.

⁂

Doctor F. Bergius, of Hannover, Germany, presented at the Convention of Naturalists and Physicians, Vienna, Sept. 22, 1913 (Section of Chemistry and Electro Chemistry), a paper in which he gave an interesting theory of coal formation. The following report is translated from the *Montanistische Rundschau.**

ALL COALS ARE THE RESULTS OF COMPLETED REACTIONS AND ARE NOT TRANSITIONAL

The author, whose papers at former meetings of the Society had already indicated a wholly new theory of the coal-formation process, gave the convention a detailed account of his investigations. They lead to the conclusion that the formation of coal is a thoroughly uniform, comparatively simple, and very characteristic chemical reaction, and that its product, so far as produced from cellulose, is likewise a homogeneous body of permanent chemical composition.

Physical chemistry has reached a point where it is possible to explain this process. This is done by imitating experimentally the extremely slow process of coal formation which has taken place through the geologic ages, carrying it out in a brief time, yet without changing it in essence.

WERE EARLY FAILURES TO PRODUCE ANTHRACITE DUE TO EXCESSIVE HEAT?

The earlier experiments were undertaken to attain artificially a product corresponding to coal by dry distillation at a comparatively low temperature. They led to products containing about 82 per cent. carbon and 4 per cent. hydrogen. Natural coals contain considerably more hydrogen; those, however, that have a low hydrogen content, such as anthracite, have a substantially higher carbon content than this artificial product.

According to Bergius, this failure in agreement is attributable to the fact that in the earlier experiments of Klasen and Stein, the exothermic nature of the carbonization process led to overheatings which do not occur in nature. The heat of decomposition of the cellulose is sufficient, under the nonconducting conditions obtaining in the earlier experiments, to produce a temperature of 2300 deg. Fahr. At this temperature the carbonization naturally becomes a coking process.

In order to make the actions solely those of carbonization, it was necessary to remove constantly the excess of heat developed, and this was done by heating in the presence of water, which was well adapted to the purpose by reason of its great heat capacity, conductivity and absorbing power in respect to cellulose. To reduce the process of geologic ages to the compass of a few hours, it was necessary, according to the coefficients of temperature, to heat constantly to about 646 deg. F. The heating must therefore take place under high pressure in a bomb. According to the method here described, systematic experiments starting with pure cellulose were conducted and gave the following results:

THE RESULT IS DIFFERENT AT A LOWER TEMPERATURE

Pure cellulose was not changed by long heating up to 158 deg. Fahr. By increasing the temperature and time of the reaction, the carbon content gradually increased, the hydrogen content fell, later it occasionally rose, and finally remained constant. In all experiments, however, the carbon content approximated to a constant final value of about 84.8 per cent., and the hydrogen to about 4.8. The rapidity with which these results were attained depended on the temperature.

These values are far closer to the average composition of coal than those of Stein (81.3 per cent. carbon, 3.8 per cent. hydrogen) and Klasen (82.5 per cent. carbon and 4.1 per cent. hydrogen). The attainment of such concordant values under the different conditions of the experiments certainly shows that the same process has taken place.

Of special interest, naturally, is the question of byproducts from the reaction. In spite of the difficulties which the method employed opposes to removal of gaseous products, a way was found of determining their composition. There was obtained in all cases a gas of about 78 per cent. CO_2 and 20 per cent. H, which was entirely free of hydrocarbons. Investigation of the reaction quantitatively led with reliable uniformity to the following formula:

$$25\ (C_6\ H_{10}\ O_5) = 6\ (C_{21}\ H_{14}\ O_2) + 24\ CO_2 + 65\ H_2O + 18\ H_2$$

COAL IS A UNIT HYDROCARBON NOT A MIXTURE OF UNLIKE MOLECULES

The result of the so called "incarbonization" (*Inkohlung*)* is not, therefore, as formerly assumed, a conglomerate of amorphous carbon and organic substances but a uniform, stable, chemical compound produced by thermodynamic auto-decomposition of the cellulose.

There arises also a question concerning the production and substance of that coal which contains most carbon, the anthracite. It is generally assumed that we are here dealing with older products of the "incarbonization" reaction in which this reaction has progressed farther.

In the light of Dr. Bergius' observations, this idea is not tenable. Neither by further raising the reaction temperature nor prolonging the time was it possible to depart from the value for carbon content obtained by thermodynamic auto-decomposition of the cellulose.

---

*Translated for "Coal Age" by E. P. Buffet.

*The meaning of this word is uncertain, the difficulty being that it has been invented by the author and cannot be determined from its use in contemporary literature. Inkohlung may mean the reactions by which the carbon percentage is increased by driving off hydrogen and oxygen as opposed to reactions of true carbonization in which the body is carbonized from without. Or it may mean that the expulsion of hydrogen and oxygen takes place within an inclosed space and subject to the pressures created by the gases formed by reaction.—Ed.

EXTREME PRESSURE PRODUCES ANTHRACITE

There was finally found, however, another method of attaining products still richer in carbon—the employment of very high *pressures,* of about 5000 atmospheres. If the products previously obtained were subjected, with a simultaneous moderate increase of temperature, in a suitable experimenting apparatus, to pressures of the magnitude stated, there finally resulted products of about 88 per cent. carbon and 4 per cent. hydrogen, corresponding to natural anthracites.

This process runs its course much more rapidly than the former one, or it can be completed at far lower temperatures if the duration of the action be sufficiently extended. The gas arising from it, which naturally is much more difficult to sample and analyze, possesses a very different composition, that is, about 6 per cent. CO_2, 18 per cent. H_2 and 75 per cent. CH_4.

This result agrees remarkably well with the fact that "lean-coal" mines are those in which firedamp develops abundantly. But also the obvious explanation of anthracite formation from the foregoing experiments, through the effect of high pressure on the "younger" coals, agrees perfectly with geologic experience, according to which lean coals are always produced where heavy rock or folding pressures are exerted.

The course of the coal-formation process according to the experiments of Dr. Bergius was as follows:

EFFECT OF TEMPERATURE, TIME AND PRESSURE ON CARBONIZATION

Temperature (Fahr.)	Time Min.	Per Cent. C	Per Cent. H	
644	18	83.1	5.1	"Incarbonization"
631	117	84.7	4.8	
644	19.5	84.9	4.8	
644	24	84.6	4.8	
644	72	84.8	4.8	
356	64	87.4	4.4	Pressure of 5000 atmospheres
644	20	87.0	3.9	

TWO SEPARATE COMPOUNDS FROM CELLULOSE, WHICH ARE NOT TRANSMUTABLE

It is found, therefore, from the observations made, that the formation of mineral coal takes place according to two different processes. One of them, a process of free decomposition, leads from the cellulose to a stable uniform chemical compound $C_{21}H_{14}O_2$, which is the basis of coals of the fat type, and which may be characterized as "ideal coal."

The other leads from this product, under influence of higher pressures, to coal of the anthracite type. Differences in composition, structure and behavior of the various coals are, generally susceptible of being accounted for by the substances that are decomposed along with the cellulose or are held in it, such as organic (albumen, resin) or inorganic mixtures.

Moreover, since the percentage composition of the "ideal coal" has been determined, it is perhaps possible also to investigate the constitution of actual coal. When this is known, we may be able to utilize coals in other ways than by burning them.

⁂ ⁂

Tennessee's State Coke Plant at Petros

BY A. W. EVANS*

SYNOPSIS—Brief description of coke operation owned by a state government. The plant is located in the Brushy Mountain field. The author gives some valuable cost data both on construction and operation.

⁂

The state of Tennessee owns 14,000 acres of coal land in Morgan County, in the geographical center of the Brushy Mountains coalfield. The mountain series in this immediate vicinity are known as the Palmate. Their salient characteristics are long narrow spurs with intervening valleys, ranging approximately north and south. The valleys have fairly moderate gradients presenting favorable conditions for railroad construction.

GEOLOGY

The measures of this vicinity belong to the Carboniferous system. All three of the subdivisions are present. The upper measures are only partially represented, but the middle division is apparently complete, and both of the coal seams in the lower or conglomerate division are also present. The upper measures carry the greatest number of workable coal seams, both in Tennessee and Kentucky. The middle measures are the poorest, but

TENNESSEE'S STATE COKE PLANT. TIPPLE BINS AND WASHER ON THE LEFT AND POWER PLANT ON THE RIGHT have one valuable seam, the Brushy Mountain. The aggregate thickness of the Carboniferous system in this section is approximately 3400 ft., being subdivided as follows: Upper measures, 800 ft.; middle measures, 1400 ft.; the conglomerate measures, 1200 feet.

---

*Petros, Penn.

In a general way the structural geology of Tennessee is comparatively simple. The measures rise steadily from the Kentucky State line as they approach the boundaries between Tennessee, Alabama and Georgia. This field was first opened in 1868, General Wilder, who served as a colonel in the civil war, having heard of the mineral wealth while on a military expedition into the region.

THE STATE PLANT

Doctor Safford says of this plant:

The state of Tennessee constructed its mining plant in the Crooked Fork Valley where it is working two seams, the Brushy Mountain at an elevation of 1625 ft. and the Pioneer at an elevation of 2095 ft. In 1896, one hundred coke ovens were constructed on the property at Petros, Tenn. The ovens are of the ordinary beehive type, 12x7 ft., and are built on a 1.5 per cent. grade to expedite the charging which is done by means of rope haulage.

Some years later 40 additional ovens were constructed in a parallel bank. These latter are 12x8 ft., and are what are known as the Rockwood type which embodies something unique in door construction. The brick work of the ordinary beehive oven is supplemented by a matted cast-iron arch, together with seven cut arch stones and two skew backs. There is also a change in the main door casting, the top being made at the proper angle to receive the crown brick.

The eight heavy jambs in the old-type oven are replaced by 20 small ones which conform with the radial lines of the oven, and the thickness of the ringwall brick. The construction of the retaining wall permits the coke puller to get closer to the oven so that shorter tools can be used. The sloping hearth in this type of oven prevents breakage although it makes it hotter for the coke puller.

DETAILED COST OF OVENS

I have found that these walls withstand the hard service remarkably well. The following is an estimate of the cost of construction of this type of oven:

Estimate

1 ring or trunnel head	$2.00
1300 r.w. brick at $18	23.40
2850 crown brick at $18	51.30
95 skew backs at 20c.	1.90
124 bottom tile at 8c.	9.92
24 jambs at 8c.	1.92
1 c.i. door frame	7.00
1 matted c.i. arch 1100 lb. at 2½c.	27.50
1 ton of fire clay	3.50
1½ yd. of sand at 60c. (under bottom tile)	0.90
15 ft. 70-lb. rail to carry larry track, 350 lb. at $30 per ton	10.50
14 ft. 70-lb. rail, larry track, 326 lb. at $30 per ton	9.78
14 ft. c.i. water pipe, 434 lb. at 2c.	8.68
14.5 cu.yd. mortar wall at $2.75	39.87
Building oven	19.00
125 cu.yd. excavation at 40c.	50.00
220 cu.yd. of dry wall at $2.75	55.00
Filling around oven	5.00
440 common red brick at $7 (brick for piers)	3.08
6½ bbl. lime at 60c.	3.90
4½ yd. of sand 60c.	2.70
Laying yard tracks at 10c. per ft.	2.80
Laying larry track at 10c. per ft.	1.40
Laying water pipe at 10c. per ft.	2.80
1 coke oven lid, 75 lb. at 2c.	1.50
Valves, hose, etc.	5.00
112 railroad spikes, 5½x$\frac{9}{16}$-in.	2.00
1 bridle bar for holding track in gage	1.00
28 railroad ties at 45c.	12.60
28 ft. 70-lb. rail for yard tracks, 653 lb. at $30 per ton	19.59
	$385.54

The cost of coke making at this plant will not vary materially from the cost sheet as herewith presented:

Accounts	Free Labor and Materials	Convict Labor Days	Convict Labor Rate	Convict Labor Amount	Total Amount	Cost per Ton
B. & M.	$4,424.14				$4,424.14	$0.0865
C. D. ovens	1,310.53	10,152	$0.4546	$4615.68	5,926.21	0.1158
C. O. repairs	1,110.97				1,110.97	0.0217
C. O. supplies	446.99				446.99	0.0088
Gen. exp.	1,486.17				1,486.17	0.0290
Loading coke	484.75	6,490	0.4546	2905.20	3,389.95	0.0663
Salaries	3,031.63				3,031.63	0.0592
W. coal	1,378.12	3,243		1494.32	2,872.44	0.0561
Coal coked	48,008.86				48,008.86	0.9388
Totals	$61,682.16			$9015.20	$70,697.36	$1.3822

Yearly output (tons)	51,148.25
Shipments (tons)	51,225.40
Average price	$2.5489
Coal coked (tons)	102,578.00

The cost of coal entering into the manufacture of coke, will range from 46 to 60c. per ton.

The coke shipped from the Brushy Mountain Coal Mines finds a market at the Roan Iron Co. furnace at Rockwood, the Dayton Coal & Iron Co. at Dayton, and the Citico Furnace Co. at Chattanooga, Tenn.

The coke has been subjected to chemical analysis with the following result:

Water	0.06
Volatile matter	2.17
Fixed carbon	83.39
Ash	14.38
Sulphur	1.77
Phosphorus	0.008
Real specific gravity	2.00
Apparent specific gravity	1.06
Per cent. coke substance	53.00
Per cent. coke cells	47.00
Shatter test over 2-in. screen	64.40
Shatter test over 2½-in. ring	76.60

The coke made from the Brushy Mountain seam has a bright metallic luster and is quite firm when freshly drawn from the oven; when mixed with a purer coke it makes a first-class furnace fuel.

To determine the best method of treating the coal and to decide as to the proper size to which it should be reduced to obtain the best results in washing, the following float and sink tests were made:

1½-In. to 1-In. Mesh	**% of Sample**	**% of Ash**
Float on 1.35	18.51	3.05
1.35—1.55	No sample	No sample
Sink in 1.55	1.88	81.30
	20.39	
1-In. to ¾-In. Mesh		
Float on 1.35	16.63	3.50
1.35—1.55	2.78	19.10
Sink in 1.55	1.21	84.00
	20.62	
⅜-In. to ¼-In. Mesh		
Float on 1.35	8.79	4.50
1.35—1.55	1.05	19.52
Sink in 1.55	0.68	69.29
	10.52	

Note—Solutions having specific gravities of 1.35 and 1.55, respectively, were used in making these tests.

The percentage of ash in the total product 1½ in. to 0 in. of coal that floated on a liquid of 1.35 specific gravity would equal 3.64 per cent. and a recovery of 79.97 per cent. The percentage of coal floating on the specific gravity of 1.55 would equal 8.7 per cent. and carry a percentage of ash equal to 20.5 per cent. This quality of coal is termed "bone coal" and shows that in order to maintain a low ash content in the washed product, it must be drawn off with the refuse.

The coal for coking is washed on a Jeffrey-Robinson washer, then carried by elevators to a retention bin of 1000 tons capacity. The washed coal is charged into ovens by two 7-ton larries, connected in tandem. These larries are circular and of the double-discharge type; they run to the oven by gravity, pulling the rope after them and after the oven is charged the clutch on the drum is engaged and the cars drawn back to the bin.

Shaft Sinking under Difficulties

By Charles A. Hirschberg*

SYNOPSIS—In the western part of the Pocahontas field great difficulty is experienced in reaching the coal measures on account of the amount of water encountered. This article describes how some of the principal obstacles were overcome and a good rate of sinking attained.

⁂

The undeveloped area of the Pocahontas coal field lies at considerable depth under water level, necessitating deep shafts to reach and develop these rich measures. Extensive development, in this territory, and likewise the deepest shafts were undertaken by the Carter Coal Co., at Coalwood, W. Va., during the present year. This development and all problems and methods for overcoming the various difficulties encountered were worked out and prepared under the direction of William B. Crawford, consulting engineer for the company.

The main or hoist shaft is 16x30 ft., rectangular, timber-lined, having two hoistways and a compartment for stairway, pipes and wires. The depth when completed will be 650 ft. to the Pocahontas No. 4 seam of coal, and the development is planned for a production of 5000 tons of coal per day. The air shaft is 15x22 ft., rectangular, timber-lined and divided into two compartments, one for air and the other equipped with a geared electric hoist for materials and men.

To hoist the required tonnage from this depth, using single-decked cages, hoisting one 4-ton car per trip, presented an unusually difficult problem. To meet these requirements and conditions, a double conical-drum hoist was designed, coupled directly to a slow-speed, direct-current motor, driven by a motor-generator set having flywheel equalizer and Ward-Leonard control. This hoist will be the largest and most efficient of its type, so far installed in the United States, and is now being built by the Westinghouse Electric & Manufacturing Co., at Pittsburgh, Penn.

Success of Sinking Thought Doubtful

The success of shaft sinking in this territory has been considered a doubtful proposition, owing to the enormous volume of water to be passed through at various depths, and several companies have abandoned such projects, or carried them through, only at enormous cost. This company while fully realizing the magnitude of the undertaking decided after careful investigation and study that the work could be done in an economical manner, and the various streams of water excluded permanently, as well as during sinking, by forcing cement grout into the fissures and crevices of the water-bearing strata, in advance of the sinking, and thus cementing off the water over a considerable area on all sides of the shafts.

Ransome-Canniff grout mixers are used for this work and the grout placed under about 100-lb. air pressure. The grouting holes are drilled with a Sergeant 3¼-in. rock drill. The results obtained have been highly satisfactory, making the work of sinking reasonably dry. This company also proposes, at its second pair of shafts which are to be started in the near future, to shut off all water by grouting, before actual sinking is begun, thus making the work dry and rendering much greater speed possible when the shaft is sunk.

After the work of sinking had progressed some 200 ft., it was decided that the ordinary type of air drills mounted on shaft bars and tripods, was neither giving the best results nor making the progress desired. The space required to operate these drills interfered seriously with continuous mucking, and the delays necessary in lowering and hoisting equipment, setting columns and mounting drills were considerable, and seriously affected the average sinking speed.

After several experiments, six Jackhamer drills, of the self-rotating type, made by the Ingersoll-Rand Co., were installed and a different method of drilling and shooting was adopted. With these drills and system, each shift is required to drill, shoot and muck out, giving an average gain of 3 to 4 ft. per day in each shaft. This is considered good progress, taking into account the adverse character of the formation, and the delays on account of grouting and water, and has more than doubled the speed of the old system using the other type of drill.

The method of working and drilling is shown in the accompanying sketch. The shaft is divided into two sections *A* and *B*, each being drilled and shot alternately, so that each section in turn becomes the "bench" and the other the "sump." This method of sinking permits drilling and mucking operations to be carried on simultaneously by restricting the muck to alternate sides of the shaft. This sump is kept clear of water by means of two Cameron sinking pumps.

The Arrangement of Holes

The sketch also shows the position of the various holes. The round averages 24 holes, 6½ ft. deep for each section, 8 being drilled for cut holes and 14 for squaring, while the two marked *X* are drilled last and fired with the squaring holes to act as lifters.

The average drilling time for the round, using the Jackhamers, has been reduced to from 3½ to 4 hours.

---

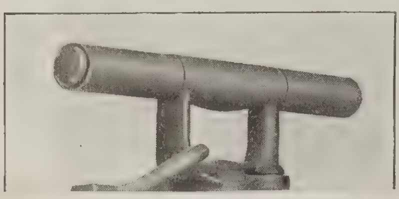
*11 Broadway, New York

The steels advance in 1-ft. changes from 2 to 8 ft., with bit sizes as follows:

No. 1—2-ft. steel, 2¼-in. six point, or rose bit.
No. 2—3-ft. steel, 2⅛-in. six point, or rose bit.
No. 3—4-ft. steel, 2-in. cross bit.
No. 4—5-ft. steel, 1⅞-in. cross bit.
No. 5—6-ft. steel, 1¾-in. cross bit.
No. 6—7-ft. steel, 1⅝-in. cross bit.
No. 7—8-ft. steel, 1½-in. cross bit.

This gives a gage variation of ⅛ in. and the steel being ⅞ in. hollow hexagonal, provides ample clearance for the cuttings to be expelled.

This is greatly aided by the hole-cleaning device, or throttle placed on the exhaust *A*, see Fig. 2. The operator closes the throttle forcing the air down through the hollow steel to the bottom of the drill hole, and assists the cleaning action



the Appalachian Power Co. from one of its numerous substations. A pressure of 100 lb. is maintained at the drills, and the explosive used is 1-in., 60 per cent. gelatin, fired with electric batteries.

I am indebted to Mr. Crawford, also to J. J. Renehan, superintendent of sinking, and George E. Kerivan, for much of the foregoing information.

⁂

Power-Plant Depreciation

Depreciation of power plants is often a puzzling question to the colliery engineer. A recent issue of *Power* offers some good advice on this problem. We quote as follows:

> A power plant uses up engines as well as coal and oil. If an engine costs twenty thousand dollars and lasts twenty years, the plant has used up, on an average, one thousand dollars worth of engines a year, and this must be taken into account in making up the cost of power just as certainly as the cost of the coal, labor, repairs, etc., for which money is actually paid out each year.
>
> It is usual to charge the plant with a certain percentage of "depreciation," diminution of value, used-upitiveness each year. A common figure is 5%, which assumes that the plant would need to be entirely renewed in twenty years.
>
> Charles M. Ripley has collected some data bearing upon the life of plants in and about New York. He furnishes a list of plants of which one has been running 30 years; two, 29 years; two, 25 years; two, 23 years; five, 22 years; two, 21 years; one, 20 years; six 19 years, etc. An increasing number can naturally be found for the shorter ages. Most of the plants enumerated were put in by Pattison Brothers, a firm of consulting engineers, with which Mr. Ripley is identified.
>
> The significant point is that these plants, even the oldest of them, are running along nicely, and there seems to be no good reason why any or all of them may not be in active and efficient service after a number of more years of use.

⁂

The Everyday Hero

By Berton Braley

There's a Dago wife in Italy
  Who's dreary an' lone an' sad,
There's a couple of kids in Italy,
  Keep askin' about their dad;
An' the money that Joe Pinazza sent
  It never will come again,
While Joe's insurance is fought in court
  By Yankee insurance men.

It was down in the West Colusa mine
  Which may be known to you,
That John Lubik had gone to his room
  As the pit-boss told him to;
But the damp got thick an' his light went out,
  An' he fell in the darkness there,
An' Joe Pinazza brought him down
  To the drift an' the good, clean air.

"I get him," he said as he laid him down,
  An' that was all he said,
Fer without a gasp he swayed a bit
  An' fell in a huddle, dead;
So we took him up on the rattlin' cage,
  An' we buried him down on the flat,
An' I reckon his soul is up above
  Where the souls of the brave are at.

Now Joe he didn't know Lubik's name
  An' he never had seen his face,
But he saved his life as a matter of course
  An' gave his own in its place.
So Lubik lives and Joe is dead
  —They said that his heart was weak—
But he went the route fer his feller man
  An' he hadn't no yeller streak.

Well, Joe was insured, but it come to light,
  That the company wouldn't pay,
An' Joe's friends sued fer the sake uv the kids
  An' the wife that was far away,
But the company said, in a legal form,
  When the doin's in court began,
That Joe he took a "needless risk,"
  In savin' his feller man.

Now I don't know much about law an' such,
  An' I don't want to know no more,
But I reckon when them insurance men
  Gets up on the judgment floor,
The last great judgment floor I mean,
  That plea of theirs won't stand,
When met by the sobs of some Dago kids
  An' a widow in Dago land.

he Cape Breton, Nova Scotia, Coal Fields

NOPSIS—Coal was probably found in Canada sever rs before it was discovered in the United States and actually shipped to market over a century before h shipments took place in this country. The fields Cape Breton were those which were first exploited. e coals have about the same fuel ratio as those of the irmont, W. Va., coals. The recent lowering of the coal iff raises the question whether this Nova Scotia coal y not regain its former place in the New England rket.

⁂

The fact that the Cape Breton coals were located by sea accounts for the fact that they were discovered ore those of the United States and because they burn ily, they were much sooner brought into practical e than the anthracites which were among the first coals t into use in this country. The first anthracite coal s shipped down the Susquehanna in 1776* and about e same time there was some coal-mining activity in e Clover Hill district of Virginia. The first recorded scovery of coal in the United States dates back to 1679 en Father Hennepin recorded the find in his diary.

Discovery of the Sydney Fields

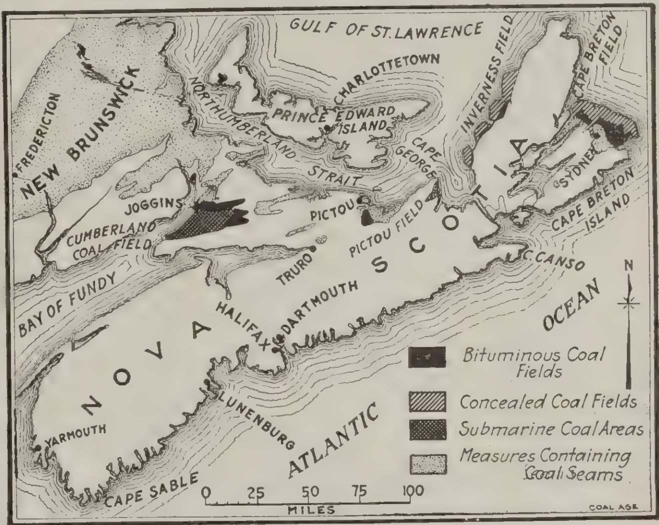
According to Joseph G. S. Hudson in his "Sections of e Sydney Coal Fields, Great Breton": The first inted notice of the existence of coal near Sidney apared in 1672 when Nicholas Denys published in Paris A Geographical and Historical Account of the Coasts of orth America. Eighteen years earlier, in 1654, Denys ad obtained from Louis XIV, a concession granting the ght to explore and work mines of gold and other minrals; for this privilege he agreed to pay the King a oyalty of one-tenth. In 1677, M. Duchesneau, the Inendant of New France, issued a proclamation, exacting royalty of 20 sous (20c.) per ton, from all persons aking coal from Cape Breton. In 1711, Admiral Walker, ho commanded an expedition to reduce Quebec, menions in his journal, that he procured a supply of coal rom the cliffs, with crowbars.

The initial attempt at systematic mining was made in 720, when it was found necessary to procure a supply of uel for the men who came from France to lay the foundaions of the fortress of Louisburg. The pit openings then nade can be seen even at the present day, at Port Morien, Table head and other places. During the next 100 ears, very little work was done, the coal mined being sed almost exclusively by the garrison at Halifax.

In 1820, however, when Cape Breton island became part of the province of Nova Scotia, a considerable tonnage of coal was being mined. In 1827 all the mines were transferred to the company known as the General Mining Association by the London firm of goldsmiths (Rundle, Bridge and Rundle) who had secured the mines and minerals concession for the entire island province of Cape Breton, from the Duke of York. The new owners immediately organized, opened out, and systematically operated, mines in Cape Breton, Pictou and Cumberland counties. A formidable agitation had been started in the province for some years previous to 1858, claiming that the monopoly of the coal lands by the General Mining Association was seriously retarding the legitimate expansion of the coal trade; this agitation eventually resulted in the whole subject being referred to the Privy Council of Great Britain for equitable adjustment.

How Nova Scotia Reduced Unreasonable Royalties

In 1858, the Mining Association surrendered its claims to the provincial government of Nova Scotia. The government in return agreed to abolish the fixed rental of 3000 pounds sterling or $14,600 per annum, together with the royalty on slack coal; to reduce the royalty on all screened coal up to 250,000 tons, to 4.80 pence or 9.6c. per ton; and to reduce the royalty on all coal sold over 250,000 tons to 3.20 pence or 6.4c. per ton. To the association, however, was reserved the exclusive right to 20 square miles in Cape Breton, and to 4 square miles each in Pictou, Joggins and Springhill counties respectively. Under this new regime, mining developed to such magnitude that, in 1865, the provincial government appointed an inspector of mines, John Rutherford, M. E., the first on this continent.



Map of Nova Scotia, Showing General Location of Coal Fields

Reproduced with some changes from "Coal Resources of the World."

In 1854, the Government of the United States removed the duty on coal. This "open-door" policy greatly increased the trade with the New England States; in 1866, the exportation of coal thereto amounted to 404,252 tons. However, in the year of confederation, 1867, the United States once again discriminated against Canadian coal, and imposed a duty of $1.25 per ton. This duty was maintained at this rate until 1872, when it was reduced to 75c. per ton; at which figure it remained until 1894. During this latter period, the exports fluctuated from 228,132 tons, to 13,883 tons.

During the period 1894-97, the tariff was reduced to 40c., but in 1897 it was advanced to 67c., at which figure it remained till this year. Despite tariff barriers, the exportation of Nova Scotia bituminous coal to the New England states continued to increase, and in 1903 the shipments reached a maximum of 968,832 tons. There has been a gradual decrease since that date, and in 1912 the shipments were 412,531 tons. The total production has, however, increased enormously; in 1912 it was 6,-

---

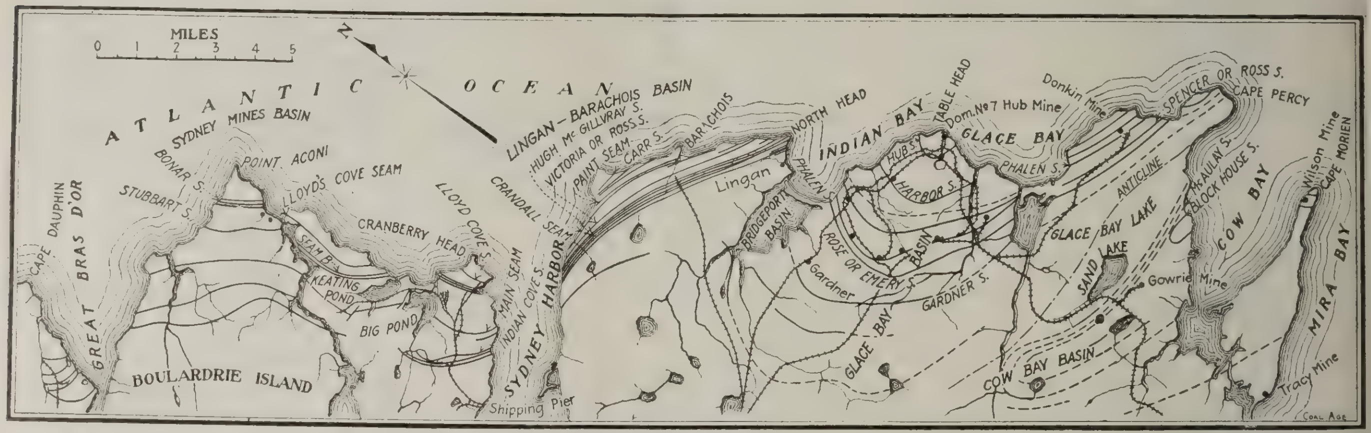
*William Griffith, "Beginning of Anthracite Coal Trade," "Coal Age," Vol. 2, p. 40.

802,997 tons (of 2240 pounds). Of this production 5,197,601 tons are to be credited to the coal fields of Cape Breton.

A Tariff War Redistributes Markets

This marked increase in the production is due in part to the increased market offered by St. Lawrence ports. In 1877 a select committee of the Dominion Parliament, appointed to inquire into the condition of the coal trade, recommended the imposition of a duty on United States coals; this duty has had the effect of opening up the markets of the St. Lawrence to the Nova Scotia coal trade, and in 1912 the St. Lawrence market alone purchased 2,159,005 tons, most of which came from Cape Breton.

On Feb. 1, 1903, the Dominion Coal Co. was organized with a capital of $18,000,000 by a special act of the legislature of Nova Scotia. This corporation amalgamated the principal interests in the coal areas on the south side of Sydney harbor, Cape Breton. These included the Caledonia, International, Gardner, Old Bridgeport, Glace Bay, Reserve, Gowrie, Victoria and Ontario mines, also the Sword areas, in all comprising 70 square miles; the areas controlled have now been extended to 142 square miles. With the advent of this great industrial organization, a new era in Nova Scotia coal mining began; new mine workings, railway extensions, new shipping and discharging facilities were developed, old coal markets were expanded, and new ones opened out, so that the whole coal trade was revolutionized. In the first year of its operations (1893) the coal mined was 834,019 tons; in 1912, the production amounted to 4,332,320 tons; or an increase of nearly 520 per cent. in 20 years.



The Coal Fields Near Sydney, on Cape Breton Island, Nova Scotia, Canada

In 1900, the Nova Scotia Steel & Coal Co. acquired all the mining rights still held by the General Mining Association. In addition to operating the existing collieries, they have opened out new mines, erected iron and steel works, and built a modern coke-oven plant, all in close proximity to the working collieries. Their Princess Pit—now known as Sydney No. 1—was, in 1873, the first submarine mine in North America, the coal being won from workings under the sea. The shafts are of unique construction, consisting of metal cribbing or tubbing. The total length of metal tubbing is 842 ft. 9 in. and weighs some 776 tons. Here, also, was erected the first Guibal ventilating fan in Cape Breton.

The most important of the Cape Breton coal fields is that known as the Sydney field. It is an extraordinarily rich tract of coal-bearing rocks, having an area of approximately 250 square miles. It extends along the northern coast of Cape Breton island for a distance of about 35 miles. Geologically the coal-bearing strata are bounded by the outcrops of the Millstone Grit, as seen at Mira Bay, and they terminate at Cape Dauphin, where the intrusive syenites of the Ste. Anne hills form the northern boundary of the Great Bras d'Or lakes. The Sydney field is divided into four main basins, as follows:

(1) *Cow Bay or Morien Basin,* defined on the east by the Millstone Grit and on the west by an anticlinal fault that dips seaward at Cape Percy.

(2) *Glace Bay Basin,* bounded by the Cape Percy anticline on the east, and by the Bridgeport anticline on the west.

(3) *Lingan-Barachois—Victoria Basin.* This basin has not so well defined boundaries as the two preceding basins, but it extends from the Bridgeport anticline, passing the eminence known as David head, to a submerged fault which exists midway in Spanish bay and Sydney harbor.

(4) *Sydney Mines or Bras d'Or Basin.*—This basin extends from the submerged fault in Spanish bay to the western termination of the coal measures at Cape Dauphin.

Seams Are Thick and Numerous

Richard Brown, the well known author of "The Carboniferous System of Cape Breton," states that the thickness of the productive measures of the Sydney field will not exceed 6000 ft. This measurement is taken from Burnt head in the Glace Bay basin, where the highest known bed occurs, down to the Millstone Grit.

The thickness of seams is approximately as follows: Bonar Seam, 6 ft. 10 in., Stubbart, 7 ft. 6 in.; Lloyd's Cove, 8 ft. 1 in.; Seam B, 4 ft. 2 in.; Sydney Main, 3 ft.; Edwards, 5 ft. 5 in.; Paint or Barachois, 12 ft. 1 in. to 13 ft. 4 in.; Crandall, 7 ft. 11 in.; Victoria, Ross or David Head, 6 ft. 7 in. to 8 ft.; Hugh McGillivray, 6 ft. 3 in.; Carr, 6 ft. 6 in.; Lingan Main, 8 ft.; Hub, 9 ft. 5 in. to 9 ft. 10 in.; Harbor, 5 ft. 3 in. to 6 ft. 1 in.; Phalen, 8 ft. 3 in. to 8 ft. 7 in.; Rose or Emery, 1 ft. 8 in. to 5 ft. 6 in.; Gardner, 5 ft. 9 in.; Block House, 9 ft. 2 in.; McAulay, 4 ft. 11 in. and Spencer or Ross, 3 ft. 9 in. Of course many of these seams are listed twice under different names. Which of them occur in the same section can be determined by inspection of the map above. Thinner beds exist but are not here recorded.

Discussion of Miners' Compensation Laws

(Continued from Last Issue)

YNOPSIS—Features of the Oregon and Washington ws discussed in relation to the need in Montana, and ompared with the experience in Illinois. Relation of ompensation to the insurance plan. Disadvantage of he general-fund idea. The compulsory feature of compensation—its need and objections thereto. Efficiency of he Alabama system as practiced by the Tennessee Coal, ron & R.R. Co. How the law helps the inspector; its ffect on small operations. Does compensation reduce the eath rate?

⁂

Mr. McDermott (*Montana*)—I want to ask a few questions of Mr. Moses regarding some points in connection with compensation laws we, in Montana, are trying o solve. The question of compensation has interested Montana for some few years past; and, at a recent session of the legislature, we had four different measures drafted for submission; but, while there were several points of difference, it was quite evident that they wnated to adopt some form of compensation law that would provide just and equitable compensation for accident.

Features of the Oregon and Washington Laws

One of the measures submitted was patterned after the Oregon law; in fact, was a facsimile of the Oregon and Washington law. The idea of the Washington law was to classify the different working classes, according to the hazard of the risk of the industry; and a certain per cent. was collected from the payroll sufficient to meet the accidents incident to the business; and it seemed that was what we wanted. One of the points raised was, whether it would be just to compel companies to pay into an insurance fund, or to adopt some form of compensation law; as they claimed that they were already making satisfactory adjustments and settlements in the cases of persons injured in mines, mills or factories.

Now, to get a little more light on the subject, I want to ask Mr. Moses, first: To whom, in the absence of the state commission, is application for compensation made, and who decides just how much should be paid, under the operation of the Illinois law? Second, what per cent. of the coal mines operating in Illinois elected to come under the compensation law? Third, what objection would there be, from the operator's standpoint, to raising a common fund for compensation? As I understand the Illinois law, each individual company takes care of its own cases.

Mr. Moses—In answer to the first question that Mr. McDermott asked I would say the amount of pay is determined by the number of defendents. I cannot give you the exact rate per child, but it is, for each child, a certain percentage of the earnings of the man while in the employ of the company. If he is a recent employee of the company, then they go to some other company or individual, and ascertain his previous earnings. The application for compensation is made to the company by which he was employed. The law is mandatory that a stipulated sum must be paid for certain injuries, such as the loss of an arm, leg, hand, finger, toes, etc.

In regard to the second question I will say that, based on the number of operators the percentage of those who elected to operate under the law is small, something like 8 or 9 per cent., I believe; but, on a tonnage basis, it is something like 35 per cent. of the entire output of the state.

Replying to the third question, the objection to a common compensation fund is the same that is made to the insurance-company plan. If I contribute one cent and a half per ton or any stipulated amount per ton, I would not make every possible effort to keep my mine in shape, and to keep down accidents; and the same reason applies to the plan of having a common fund. The best idea is to lay the responsibility on individual shoulders and every operator then will do what he can to reduce accident. In other words, operating on a common plan, an honest operator, anxious to reduce accidents and thus lower the rate of compensation, would do everything in his power to make conditions safe in the mines, while the dishonest operator would not do anything; but he would get along just as well as the honest operator, possibly a little better, and the honest operator would be paying for his risk. There is the same objection to the common fund as to insurance companies.

The Common Fund Method

Mr. McDermott—In coal mining in Washington 3 per cent. of the payroll was collected for all coal reported throughout the state. This was held as a fund by the state government, and handled and disbursed by commissioners appointed or elected for the purpose. Some in Montana favored the idea of a common fund, and this was thrashed out for ten days, in public hearings, in Helena. All of the large operating companies were willing that some sort of compensation law be enacted that would insure against accidents; but they were unwilling to have laws passed that would do, as Mr. Moses has suggested, and make those companies who were taking every precaution to safeguard their property and the lives of their employees, pay for the other man's accidents. In Illinois, as Mr. Moses has stated, each one pays for their own accidents. There is no common fund or anything of that kind. If Montana had such a law we would have to safeguard our mines better. It seems to me that under the Illinois law a man should show a certain financial responsibility, before he is able to operate. But with a common fund the poor man would be able to operate because he is helped by the extra precautions and safeguards of the larger companies.

There is no difference in opinion among mine workers as to whether a compensation law would be good or absolutely necessary, but what system will give the best satisfaction seems to be the stumbling block. As far as I have heard the argument, I would rather favor a fund, handled by a state commissioner. There are several objections that might be raised against making application to local superintendents for injuries that may or may not be entitled to compensation. For example, if Tom Jones happened to come two or three times a year with little trivial claims for accidents, a superintendent would ignore his claims. On the other hand, I realize that, in a great state like Illinois, with a large number of employees, it would keep three or more commissioners busy, to investigate every accident that occurred. But I believe we have reached a stage now that compensation is coming whether we want it or not. I believe that West Virginia is modeled more after the German plan. I am greatly in favor of compensation laws.

Mr. Moses—I want to say that the question raised by Mr. McDermott was thoroughly discussed in Illinois, and there is a firm stand by both employer and employee against the general fund idea; and I believe they are right. I am not a convert of the general fund idea, for the reason that, as I said before, it is open to the same objection as the old system of insurance companies. We might just as well leave it in the hands of insurance companies as to establish a general fund. The fund would have one of two things happen to it; it would either be imposed on by the dishonest operator and dishonest employee, to the detriment of the honest operator and honest employee; or the delay in legitimate claims would impose upon the needy. You have created exactly the same feature that characterizes an insurance adjuster who works to adjust every claim for the least possible money that would be accepted. When everybody is responsible for his own protection, he is interested in preventing accidents, which is the real purpose of compensation. We shall find that it is cheaper to prevent accidents than to pay for them; and that should create ideal conditions in coal mines.

Mr. Adams (*Pennsylvania*)—Did you discuss the idea, in Illinois, of making all companies pay compensation?

Mr. Moses—I feel, personally, that it should be compulsory; but to get the law through at all, we had to submit to the amendment, and make it elective with the companies. We are still fighting for the compulsory compensation law, and hope to win out finally.

The Assessment Plan

Mr. Flynn—I want to say, in conection with these two plans, that probably the plan of Montana would be the better plan for compensation; but the question we are most interested in is: What plan will best serve to reduce accidents in coal mines? I will say that the T. C. I. have tried out several plans. When they first undertook compensation they inaugurated the plan of levying an assessment of so much per ton on the whole output, regardless of any division. After trying that for about two years, it was found that some superintendents were not as active as others in trying to prevent accidents, claiming that the same amount was charged to them, regardless of whether they had any accidents or not, and the mine that had a large number of accidents did not pay any more into the general fund than where they had none.

Then the plan was changed and each division was charged with its own accidents. If one division had no accidents, they didn't pay anything; and if another division had ten accidents, their output was charged accordingly. The superintendents then got busy; because if the accident assessment was four or five cents per ton, at one mine, and only one-half of a cent or one cent per ton at another mine, the management would ask at once, why one division has to pay so much more for accidents than another division, where conditions are practically the same. I want to say that the system worked more successfully than we dared to hope; and all superintendents are now trying to keep the cost of accidents down to a minimum, while under the old system they were not interested. Now, if that applies to a company, how much more would it apply to a state where there are a number of companies. It may be argued that in the mines operated by one company, condition would be much the same, but they are not; and, since changing the system, we have reduced our accidents to a marvelous extent. I am, therefore, strongly in favor o making each individual company stand for its own accidents.

Claims for Pretended Injuries

Mr. Bolt—I would like to ask Mr. Moses: To what extent have employees of your company attempted to impose on their employers, under the compensation law, or tried to extend the time of idleness for injuries or attempted to collect compensation for imaginary injuries?

Mr. Moses—I will say that it would be impossible for me to state off-hand the exact number who have tried to lengthen the time of injury by pretending inability to return to work or claimed compensation for injuries not received; but I can state assuredly that out of the 3200 men we have employed, such cases would not exceed ten or thereabout.

Mr. Flynn—How do you decide as to when a man is able to go back to work?

Mr. Moses—We require every injured person to be examined by our physician and if he refuses we pay him nothing; but if the person injured elects to have some other doctor or a number of doctors, he can do so; and we will send him to any hospital he desires, and pay his expenses; but he must submit to examination by our physician, who will say when he is ready to return to work. He must get an order from our physician to the manager of the mines where he was formerly employed, before he can return to work. I will say that we have had more trouble with men wanting to return to work before our physician thought they were able, than with men not wanting to go back to work; and it is more burdensome to the compensation plan for men to go back before they are fully able, than to stay out a few days longer than is actually necessary.

Mr. Flynn—The T. C. I. Company have a similar plan, but if a man elects to have an outside physician, we require that physician to make a report of the accident, and give the man a "return-to-work" slip, which he must have before he is allowed to go back to work. Many insist on going back to work immediately. A broken finger they don't think amounts to anything; but the doctors fear infection and hold them out till that danger is past. A few insist on staying out longer than the doctor requires. Wrenched and strained backs are accidents that will fool the very best doctors. There are more impostures in this class than actual injuries. A fake injury such as a sprained or wrenched back is hard to determine.

Mr. Moses—I will say that our experience is much the same as Mr. Flynn has described. We expect, under the compensation law, to be cheated by some; but we still think it is the best plan of operation.

Comparative Cost under Compensation Act

Mr. Flynn—Have you any data comparing the cost of accidents prior to the compensation act, and since operating under the act?

MR. MOSES—The only available data previous to operating under the compensation act was the sheet showing the total cost of labor, which included many men of no value whatever around the mines. Owing to the practice of giving easy jobs to a certain number, which had been in operation and was a burden, we had no accurate way by which to obtain figures showing the cost of accidents. It was only possible to compare the total cost of accidents and labor now with the total previous cost of accidents and labor. By this comparison, the total cost appears to have been materially reduced; but it is not entirely on account of compensation; because we have renovated the mines and put them in good shape; and installed new equipment, which would tend to reduce the cost without compensation. The claim I make for compensation is that it has enabled us to accomplish this result better than could be done without the law.

MR. SYLVESTER (*Tennessee*)—I thoroughly agree with Mr. Moses in the conclusion that we must put the liability on the individual employer, in order to cut down the accident list. I would like to ask: To what extent have the small mines, working on a limited capital, adopted this proposition?

MR. MOSES—I don't think that I can answer that question at all, but perhaps Mr. Bolt could answer the question as to the number of operators that have come under the law.

FROM THE INSPECTOR'S STANDPOINT

MR. DUNLOP (*Illinois*)—I would like to say a few words about the Compensation Law, from the inspector's standpoint. I have not regarded this law for the compensation given to the injured employee, or to the family of a man who is killed; but as a means of reducing mine accidents. Few of our operators have elected to work under the compensation act; but the largest operators have done so. Looking more to the prevention of accidents than anything else, the inspectors have met the commissioners frequently, for the purpose of securing what we call "face bosses," for the purpose of supervising the work of the miners and preventing accidents.

One year ago on the first of May, when the Compensation Act first took effect, a coal company that employs something like 1300 men, in two mines, and which, prior to that time had just one face-boss, put on four extra bosses, the very day the act took effect. Some of these men look after the working face only; others see that the men timber their places properly. The records show, however, that they have had more accidents since putting the four men on, than they ever had previous to that time; although it is true that the men were reporting more accidents than they did before.

There is one feature about the Compensation Law, as far as the inspector is concerned; it is better than insurance. Insurance companies, as a rule, simply comply with the statutes and no more; and if an accident occurs, the insurance company makes the settlement. Under the Compensation Act, the operators go further; they do more than the law requires, which is, to me, one of the best features of the law. When the operator is willing to do more than the law requires, it makes it easier for the inspector. The law, in its present form, is hard on small operators, many of whom cannot operate under its provisions. They are required to file a bond, showing that they are responsible and able to take care of any accidents that may occur. That provision will deter many who would be glad to work under the law. * * * * *

I want to say, it was stated that twenty years ago we had good, practical, English-speaking men in the mines; and today 70 per cent. of the miners in Illinois are foreign-speaking men; but with all that, the number of accidents is no greater, but remains the same. The death rate seems to be fixed, as we have not been able to reduce it; but I believe that the Compensation Law is going to be the means of reducing the number of accidents at the face, due to falls of coal and rock. Fifty per cent. of mine accidents occur at the face; and the Workman's Compensation Act is the only thing that will help us. We are not having any more accidents on account of non-English-speaking men in the mines. For every 250,000 tons of coal mined in Illinois, there is a man killed; and that is true of nearly every state.

COMPARATIVE RESULTS

MR. WILLIAMS (*Pennsylvania*)—How do present results compare with those under the supervision given in the face twenty years ago?

MR. DUNLOP—The present law only took effect one year ago; and, as Mr. Moses stated, we are now having reported more accidents than were ever heard of before. I will refer, in reply to your question, to a mine that has been worked with face-bosses, now, for the last six years. The year before the Workman's Compensation Act took effect, the company paid out $1000 for compensation, in one mine alone where 600 men are employed. This last year, under the Compensation Act, when all of the men knew they were entitled to compensation, it cost the company $1800 for accidents. That is the lowest estimate that I have gotten from the district. Another feature is: The injured miner does not know how much he is going to get until he is laid off and the cause of the accident is learned. I will say that the operators are very reasonable and pay what they consider a fair compensation. Viewed from the standpoint of preventing accidents, it is what we want, and I hope it will accomplish that purpose.

EFFECT OF LAW ON FATALITIES

MR. BOLT—In discussing fatalities in Illinois, Mr. Dunlop said the death rate in the last twenty years has remained about the same. I don't know that he is quite correct in that statement, but, if he is, there is something the matter, because anyone who has been in Illinois during the last twenty years knows that conditions have improved wonderfully in the mines, in that time: Ventilation is 100 per cent. better; efficiency in the management has improved by 100 per cent. or more; conditions under which the men are working have improved all around. I hold and have always held that the reason accidents have not been reduced was because of the influx of foreign labor, and I would like to have Mr. Dunlop tell me why, with all of these improvements, the death rate and the rate of accidents have increased, if it is not due to the cause I have stated. With all of the improvements the accidents should not show the same ratio of increase that the tonnage did. I repeat, it is because of the influx of foreign labor in the mines—men who know barely enough to use the pick, and don't know how to protect themselves.

MR. DUNLOP—In looking over the reported fatalities and investigating accidents, I find that it is not the green men that are being killed. It is the men who have been working in the mines for years. The green man—the foreigner—takes better care of himself than the man of experience. In my opinion the reason for the great number of accidents is careless neglect, growing out of familiarity with the conditions, and taking chances. They gamble on it. It is the experienced men among the non-English-speaking men who are killed.

Mr. Back (*Illinois*)—In the district that I represent (the sixth), the large companies are working, not exactly under the Compensation Law but something similar, while the smaller companies set aside a certain amount as a sort of trust fund, to take care of accidents. The large mines employ face-bosses. In the last year we have only had two nonfatal accidents and but one fatal accident. I have asked what it cost to insure, and the reply was about $44 on each $1000 carried on the payroll. What does it cost under the Compensation Law? The answer is: Less than one-half, after paying all costs of injuries from accident.

I find, also, that when companies are carrying insurance a great many of them do not attempt to keep their mines in good condition; they neglect passageways, driveways, etc. I am heartily in favor of the Compensation Law, and I don't have to ask whether they are working under the law or not; I can see it. Companies working under the Compensation Law are more careful and particular than those where the insurance companies pay the bill. * * * * *

Pertinent Questions

Mr. Paul (*Pennsylvania*)—The discussion on this subject has been both interesting and profitable, although some of the discussions have wandered some from the main subject. I would suggest there are a few questions that it would be well to have answered in order to complete the records; so that other members who could not attend the meeting may have the information. I will ask Mr. Moses to kindly answer the questions as I ask them.

Ques.—Under the Compensation Law, of Illinois, have the fatal accidents increased over and above the accidents prior to the operation of the law; or does the increase mentioned apply to mostly nonfatal accidents?

Mr. Moses—I could not answer that question for the entire state of Illinois, because such a small percentage of the operators are acting under that law. I can only answer relative to our own operation, that the fatal accidents have decreased, while the nonfatal accidents have increased.

Ques.—What provision is made for the protection of miners who come under the Compensation Law, at a small operation that may subsequently go into bankruptcy or into the hands of a receiver, or be closed down by reason of a mine fire, if at that time there is standing against the operator a number of claims for the payment of compensation for total or partial disability?

Mr. Moses—It would be the same if that property owed the miner wages; the obligation would rank in the same class as any debt for labor.

Ques.—Do the operators who are now operating under this law carry liability insurance to compensate them in case of accident?

Mr. Moses—Not to my knowledge. I have understood, however, that there were, at the first, some operators who took out a form of insurance against large accidents; but, so far as I have been able to learn, no operator under the law is now carrying insurance.

Ques.—At those mines operating under this law, has there been noted any increase of efficiency on the part of the men, by reason of their being given treatment and being made perfectly well before returning to work; has the production of coal per man increased?

Mr. Moses—Yes, the increase has been about a ton per man per month; but all of that, in my estimation, cannot be attributed to the working of the Compensation Law. Good ventilation and better working conditions and equipment would have some bearing on the increased output per man.

Mr. Dunlop—The new law requires that all operators that elect to come under the law must file a bond.

Mr. Beddow (*New Mexico*)—My understanding of the Illinois Compensation Law is that it is not compulsory on the coal companies to operate under that law; but part have chosen to so operate and part have not. I would like to know if these companies that are operating under the law, are exempt from personal damage suits, i.e., personal damage suits under the general law, in case of any of their men getting hurt; or are they exempt from such damage suits?

Mr. Dunlop—It does not exempt them from lawsuits; if a miner is not satisfied, he can enter suit, but he then loses his rights of fellow servant plea, etc.

Mr. Martin—In West Virginia, the law states that when the party injured was injured on account of the operator not complying with the state mining law, that party has the right to apply to the courts.

Compensation in Pennsylvania

Mr. Adams—Pennsylvania is now considering the matter; it is before the legislature. We have now something of the form of the Illinois law and some of the good features of other laws, but we want to make that compulsory upon all companies large or small. Such a bill passed the House but when it came to the Senate they started the same discussions as they had in Illinois. It is now in the hands of the conference committee. It is a measure in which the state officials have taken much interest. They want to have a law that will mean something; a law that is possible not only to one party of the coal-mining industry, but equally to both. They want to make it compulsory for all companies to go under this act and not make it elective. I think that ultimately we will get a good compensation law, one possibly superior to those of other states, because we have considered all the other laws. The bill will not come out of that conference committee until it is right and just to all. I am glad that we have, in Pennsylvania, the power to say to legislators that we must have everything just and right. The House has done a grand work and the Senate has made certain changes, but more must be done by the working people. There is a way and a method of arriving at that which will be just to all; the large operator and the small operator alike.

As it stands at the present time, the small operator, if compelled to pay this compensation, would be forced out of the business. That is the worst feature of the measure. An explosion in the mine of a small individual operator would wipe out his life savings in a day.

Program of Coal Mining Institute of America

Winter Meeting Fort Pitt Hotel, Pittsburgh, Penn., Dec. 4 and 5, 1913

First Day

10:30 a.m. .... Business Session

1:30 p.m. .... Address
"Efficiency of Bituminous Coal Mining." Harrington Emerson, Consulting Engineer, The Emerson Co., New York City.

2:30 p.m. .... Question Box
Conducted by John I. Pratt, State Mine Inspector, Pittsburgh, Penn.

3:30 p.m. .... Paper
"Safeguarding the Use of Electricity in Mines." Clyde G. Brehm, Electrician, Oliver & Snyder Steel Co., Uniontown, Penn.

4:30 p.m. .... Address
Jesse K. Johnston, Creighton, Penn.—"A Study of the Wages and Selling Prices of Coal in the Pittsburgh District."

6:30 p.m. .... Institute Banquet
Fort Pitt Hotel
Announced Speakers: Dr. W. J. Holland, Director Carnegie Museum, Pittsburgh; H. M. Wilson, Engr. in Charge, U. S. Bureau of Mines, Pittsburgh, Penn.

Second Day

10:00 a.m. .... Paper
"The Relative Effect on Men and Small Animals of Small Amounts of Carbon Monoxide." G. A. Burrell, Engr. U. S. Bureau of Mines.

10:45 a.m. .... Paper
"Basic Coke." J. R. Campbell, Chief Chemist, H. C. Frick Coke Co., Everson, Penn.

11:30 a.m. .... Paper
"What is a Proper Method of Sampling the Beehive Coke Ovens for Analysis?" F. C. Keighley, Gen. Mgr. Oliver & Snyder Steel Co., Coal Dept., Uniontown, Penn.

1:30 p.m. .... Paper
"Stray Electrical Currents." W. F. Elwood, Consulting Chemist, Greensburg, Penn.

2:30 p.m. .... Picture Show
Illustrating Coal Mining Fields and Transportation Problems in Alaska. Dr. W. R. Crane, Dean Mining Dept., Pennsylvania State College.

3:15 p.m. .... Address
"Portable Electric Mine Lamps." H. H. Clarke, Electrical Engr., U. S. Bureau of Mines.

⁂

The Wilkes-Barre District Mining School

This school, conducted jointly by the Wilkes-Barre Y. M. C. A. and the Wilkes-Barre District Mining Institute, is just entering on its fourth year, the first session having been held Tuesday evening, Oct. 14. The sessions will close Apr. 17, 1914. The courses of the school embrace practically every subject in the mining of coal. The work has the indorsement of all the leading mine officials in the vicinity. The course covers two years of practical study in arithmetic, mensuration, geometry, trigonometry, logarithms, mine gases, mine ventilation, mine surveying, mechanics, air compression, electricity and the anthracite mining laws of Pennsylvania.

Charles Enzian, mining engineer of the U. S. Bureau of Mines, is supervising principal. Mr. Enzian was the first instructor in this school, having conducted a class in mining, in the Y. M. C. A., during the winter of 1907-08. The following year the work was carried on under the auspices of the Wilkes-Barre District Mining Institute.

In 1910, it was decided to extend the course of study and a graded school was started, four instructors being employed. The reception accorded the school by all classes of mining men made it a pronounced success, and it was found necessary to start a day class for those men employed on night shifts. This departure required the employment of another instructor, making five in all. Last year, 1912-13, there were 64 students enrolled in the classes; and it is gratifying to report that six members of the school passed the examinations for mine foremen and assistant mine foremen, held in the spring and were awarded certificates of competency.

This year the day class is taught by Richard Lewis, assistant mine foreman, Lehigh & Wilkes-Barre Coal Co. The night classes are taught by W. D. Thomas, mine foreman, Kingston Coal Co., and Robert Johnson, mine foreman, E. C. Lee, mining engineer, and E. B. Wagner, electrical engineer, all of the Lehigh Valley Coal Co. The classes meet every Tuesday and Friday evening, and remain in session from 7:30 to 9:30 o'clock.

The officers and directors of the Wilkes-Barre District Mining Institute are: Thomas H. Williams, president; H. G. Davis, first vice-president; James J. McCarthy, second vice-president; F. M. Devendorf, secretary-treasurer; Thomas R. Evans, A. L. Williams, Charles Enzian, John T. Thomas, Gilbert Jones, P. H. Devers, M. J. Flaherty, Thomas H. Price, Thomas Martin, Thomas J. Williams, Samuel R. Morgans, Gwilliam Edwards, J. S. Hammonds, E. J. Newbaker, Lewis J. Davies and Thomas Thomas, directors.

⁂

Alabama & New Orleans Transportation Co.

By B. M. Starnes

That the Alabama & New Orleans Transportation Co. will take a leading part in the coal business in the South, especially along the gulf coast, is very evident. New Orleans uses nearly three million tons of coal yearly, a large portion of which comes 1500 miles from the Pittsburgh district, on account of the low water rates in comparison with the rail rates from Alabama.

The Alabama & New Orleans Transportation Co. has already completed four barges and is building eleven more, each of 1000 tons (equal to 25,000 bu. as they figure it in Pittsburgh) capacity. The barges, which are an innovation in American watercraft, were designed by General Manager John H. Bernhard on the lines of the boats so successfully used in both Germany and Holland. These barges, constructed in the company's own plant at New Orleans, are self-propelled by producer-gas engines, and the cost of operating amounts to only about $1 per day per barge, exclusive of labor. When completed and put into service, not only will they be able to compete with the Pittsburgh coal, but on account of the much shorter distance, the Alabama coal will be delivered and sold at a lower price than the Pittsburgh product.

The company has bought some three thousand acres of high-grade coal lands on the banks of the Black Warrior River above Tuscaloosa, Ala. Numerous openings are being made and the mines will eventually have an output of more than 2000 tons per day. Even this may have to be increased after a few years. The company has a great advantage in that the coal is weighed, screened, washed and loaded direct from the mine cars into the barges.

A Defense of the Flame Safety Mine Lamp

By E. A. Hailwood*

SYNOPSIS—A modern safety lamp passes flame only under several peculiar conditions, which are most unlikely to happen at one and the same time. A current of air is not likely to be at once both strong and gaseous enough to cause a good lamp to pass flame, nor are a dirty or punctured gauze, or a cracked glass so dangerous as is commonly thought. Even the crushing of a safety lamp in a gaseous mixture is little likely to cause an explosion. The safety lamp has probably been blamed for disasters in which it had no part and other causes of accident have been overlooked to the detriment of the one agent which satisfactorily determines the presence of gas and its quantity.

⁂

Prior to the days of Sir Humphrey Davy, it was no doubt natural to fix upon the naked flame then in common use as the probable cause of coal-mine explosions.

The Davy Lamp was then invented, and was thought to be a solution of the difficulties, but unfortunately it was afterwards shown that under certain conditions, gas when ignited inside the lamp could be blown through the gauze which surrounded the flame and an explosion created in the mine. The Davy Lamp was, however, remodeled, and the present type of bonneted Marsaut safety lamp was evolved.

False Inference from the Davy Lamp

It is, however, somewhat unfortunate that the tricks which could be played on the old Davy lamp have so fascinated professors and many so called Government experts, that they have not been able to realize that the same tricks cannot be played upon the modern safety lamp. These people still devote considerable time to describing and exhibiting experiments on safety lamps, and fail to draw attention to the fact that their experiments and their writings really refer to the Davy lamp and that such discouraging results are not obtained with its more modern successors.

The natural result is that an unnecessary nervousness is created in the minds of miners and coal operators who have not the time or means at their disposal to learn that these tests do not apply to the modern flame lamp, and while I agree that experiments on the Davy lamp are instructive, I contend that it is unfair to the flame-lamp manufacturers not to place more emphasis on the fact that the demonstrations refer only to obsolete lamps.

Explosions Are Charged Offhand to Safety Lamps

One unfortunate result of these records of experiments is that at the inquiries following an explosion in a mine, many practical men and many so called experts calmly state that in their opinion the explosion was caused by a "safety lamp."

From my experience in connection with a large number of tests on safety lamps, and from a perusal of evidence upon which these statements of experts have been based, I am firmly convinced that the persons giving evidence have known little or nothing about the great margin of safety possessed by modern flame safety lamps, or that the person in question has been misled by published tests on the old Davy lamp.

One of the baneful results of verdicts based on such evidence, is that instead of pursuing the inquiry further as should be done, the inquirers overlook the actual cause of the disaster. Perhaps an unnecessary change is made in lamps, and yet the real means for creating a fresh disaster are still retained in the mine.

Several Unlikely Conditions Must Conspire to Cause an Explosion

A white-hot heat is necessary to cause flame to pass from the inside of a well constructed bonneted lamp to the outside. This temperature can only be attained by subjecting the lamp to an explosive mixture containing 8 to 9 per cent. of methane traveling at over 3500 ft. per min. Persons acquainted with these facts will realize that it is a mistake to talk of creating an explosion in a mine by the over-heating of a well designed lamp. Many an explosion has been wrongly charged to this cause.

The majority of lamps now in use are fitted with bonnets or shields, and I have had lamps of this description in explosive mixtures and the gas inside the gauze burning for hours and the gauze red hot, and yet an outside explosion has not occurred. I submit that it will be an extremely rare occurrence to find the following three concurrent conditions: An explosive mixture of gas traveling in a mine at a velocity of 3500 ft. per min., a lamp placed in such a position as to receive the full force of this velocity, and a miner standing by oblivious of the unusual dangers. Such a combination of circumstances is so remote as to be unlikely to happen and may be dismissed as out of the question.

If the velocity be greater than 3500 ft. per min., but if the enormous requisite volume of gas for the passage of flame be absent, then there is no danger. On the other hand, if gas be present but if the requisite excessive velocity be missing the lamp would be unlikely to cause an explosion. Again, the miner would not be disposed to remain in such gas. The danger from "still" gas is furthermore unlikely to occur, as the illumination given out from a dangerous mixture of gas burning inside a safety lamp would be so small that the miner could not continue working by its light.

Are Explosions Likely from a Dirty Gauze or a Cracked Glass?

In another series of tests, the flame was kept burning in a lamp surrounded by an explosive mixture of gas. At intervals coal dust was scattered inside the lamp and also over the outside of the gauze. The lamp was constantly shaken about in the gas, and finally coal dust was allowed to remain on the crown of the gauze for some hours. The gas flame burned immediately underneath the top of the gauze, and had ample opportunity to heat and coke the coal dust.

The lamp had only a single gauze, and the test was carried out at our Pittsburgh factory with natural gas,

---

*Manager, Ackroyd & Best, Ltd., Arrott Power Building, Pittsburgh, Penn., and Morley, England.

Note—Paper presented to the American Mining Congress Oct. 22, 1913, at Philadelphia, Penn.

yet despite these unfavorable conditions, the flame did not communicate with the surrounding gas, notwithstanding the fact that the gauze was often red hot. If, therefore, single gauzes will not under such conditions pass flame, it is evident that an explosion is still less likely to occur where the flame is protected by a double gauze.

In other tests, a lighted bonneted lamp was passed so slack that on shaking the lamp, the glass has freely rattled. The glass was split from top to bottom, and a crevice cut right across the top and also at the bottom of the split, the crevice being more than $\frac{1}{32}$ in. wide.

This lamp was placed in a most explosive mixture of compressed gas and kept there for over one half hour with the gas blazing inside the lamp. This failed to cause an outside explosion. In the test, the gas mixture was compressed down to two-thirds its original volume, and the gas therefore was in a most explosive condition.

A Hole in the Top of the Gauze Is Protected by Incombustible Gas

In other tests, a lighted bonneted lamp was passed into an explosive mixture of gas, a hole was pierced in the top of the gauze of not less than ¼ in. diameter, and yet the flame failed to pass through the hole and ignite the surrounding gas. No doubt the reason for this was that the products of combustion from the lamp flame covered the hole in the top of the gauze with a barrier of incombustible gas, through which the flame could not pass to the outside gassy atmosphere.

To users of flame safety lamps, this test will no doubt be interesting as it is the upper part of the gauze which is subject to the most wear and tear, and fortunately the test demonstrated that it is the top part of the gauze which is usually protected by the barrier of incombustible gas.

If the lamp in question be extinguished and the products of combustion escape and if the lamp fill with an explosive mixture of gas, and an internal friction igniter is operated so as to cause a flame to form in the lamp and ignite the gas inside it, then I admit that it is possible that this flame would pass through the hole in the gauze to the outside. But this, of course, only refers to this particular type of lamp, and would not refer to those of the type which must be completely inclosed when being relit.

The Cracking of the Glass by Heat Can Be Avoided and Falls of Rock May Be Harmless

Some authorities have made much ado about the possibilities of the heat from the flame of the miners' lamp cracking the glass. This objection is only a question of a few dollars, as clear glasses can now be supplied for miners' lamps of such quality that they may be heated up to about 340 deg. F. and sprinkled with water from a watering can, and yet fail to crack.

Some people have been afraid that a slab of roof falling on a safety lamp might cause an explosion and ignite the gas; but in all the tests I have so far made, before the lamp was dangerously damaged, the flame was extinguished.

In one series of tests, a lamp was placed upon an iron piston, and the piston moved rapidly upwards into a cylinder containing gas, so that the top of the gauze came into violent contact with the crown of the cylinder and the gauze was crushed down. No outside explosion followed, the light in the lamp apparently being extinguished by the crushing or by the rapid movement of the air. It is unlikely that a lamp would be subjected to so severe a test in the mine as was that just described, for these reasons: If the gas was driven down ahead of the falling rock the rush of air would almost certainly extinguish the lamp before the rock came into contact with it and crushed it. If, however, the rock were to arrive first, the lamp would be crushed and the light snuffed out by the fall before the gas reached it. In any event an immense volume of gas would have to be released, to reach a lamp which was crushed on the floor.

In another test, an unbonneted and lighted lamp was placed in a big jet of explosive gas, and the gauze smashed by a violent blow with a mallet. This also failed to ignite the gas, the blow invariably extinguishing the lamp flame. I, therefore, contend that by using a bonneted lamp of suitable design all fears that physical violence may injure it in such manner as to cause an explosion may be discounted.

While I do not, for one moment, advocate the relaxation of any possible effort to insure the supply and issue to miners of nothing but the best and safest lamp. I am of the opinion that the tests just mentioned have shown that the miners' safety lamp gives a larger margin of protection than is generally supposed.

The Present Test for Gas Is So Simple that Another Test Is Sought

It is somewhat unfortunate that the method of ascertaining gas percentages by the safety lamp is so simple that after only a few minutes' or hours' practice with a simple gas-cap observation machine, practically any mine man can read the percentage of inflammable gas in the atmosphere.

It would, no doubt, appeal more to the present "wise" generation if the lamp could be fitted with a series of levers, switches and indicating dials. The appliance would be even more valuable if when the reading were taken, elaborate reference had to be made to square-, cube-root and other tables to interpret the figures obtained. It would then no doubt, be looked upon as a marvelously clever device, and more attention would be devoted at colleges and mining schools to the elaboration of its mysterious workings.

Now putting sarcasm aside, I would submit that the miners' flame safety lamp is the most simple and most accurate and most reliable device which could possibly be conceived for the practical ascertainment of percentages of gas in the atmosphere of a coal mine.

In recent years the organization of evening mining classes has made great strides in all the coal districts of Great Britain. A very large proportion of both adult and young miners have attended these classes. From conversations I have had with many of the teachers and with men in the mines in various parts of the country, and from observation of the behavior of the mining men who visited the works with which I am connected, I am of the opinion that this course of education will ultimately prove to be one of the biggest factors of safety introduced in recent times into the coal mines.

The Importance of Gas Testing Increases

A few years ago few miners knew how to test for gas and read "gas caps." The consequence was that men have often ignorantly continued working in places so charged with gas as to be on or near the border line of explosibility. No doubt the miner has done things which he would have avoided had he known the dangerous condition of the atmosphere in which he was working.

It has now been established that a severe explosion can be obtained from quite a small percentage of gas if coal dust be present. The present tendency in coal-mining practice is to employ vast numbers of men in every mine on each shift; the number of deaths from an explosion is therefore more appalling (as witness the recent explosion in South Wales, England, where over 400 men appear to have been killed), to employ more electric machinery, such as coal cutters, locomotives, motors, to push the coal face forward more rapidly and risk falls of large quantities of rock roof with the possible bringing down of gas to be ignited by sparks from the grinding rock.

There are also the possibilities of explosions from pipes, cigarettes and matches, so that it is now more necessary than ever to place in the hands of each miner, the means whereby he may ascertain the state of the atmosphere in which he is working.

The best course to pursue will no doubt be to educate the miners more and more into the best methods of using the flame safety lamp and also as to the best manner in which to test for gas.

Some parties have proposed that a flame safety lamp be placed at the entrance to each working place. This is to be given into the charge of the "gangman." This lamp will generally be neglected, however, and as the principal object of the "gangman" is to get as much coal as possible, he will, no doubt, fail to take a lamp into his working place at sufficiently frequent intervals.

On the other hand, if each worker be provided with a flame safety lamp, the early detection of the presence of gas is better assured. Even with the best of ventilation some parts are likely to be overlooked and an explosion of gas may be extended by coal dust throughout the mine.

THE ILLUMINATION AFFORDED BY THE SAFETY LAMP

Many writers who discuss unfavorably the light given by a flame safety lamp appear to forget that the coal miner does not go down into the mine for the purpose of reading the daily newspaper, but rather to hew coal from a generally well defined coal face, and that, with constant practice he gets so that he could do the work almost blindfolded.

They also overlook the fact that, generally speaking, several men work so near each other at the face that they get a large general lighting effect from the several lamps.* A miner's light, may on the surface seem to be a miserable one, yet in the darkness of the coal mine this same light is quite sufficient for the work.

Certain parties blame the flame of the safety lamp for certain diseases of the eyes of miners, but it would now appear that there are some mine workers who have had the benefit of the increased light from acetylene lamps, yet they now complain that this increased light hurts their eyes. This would seem to raise the question as to what is the proportion of miners whose eyes are naturally weak. These would suffer pain whether the light were good or bad. The elimination of these cases will possibly show that the remainder will be quite satisfied with the existing miners' flame lamp; if not, the illumination can now quite easily and simply be increased to 1½ candlepower.

---

*This is not true in the pillar workings of the United States. Most of the English workings are longwall.—Editor.

⁂ ⁂

The Coal Strike in Colorado

SPECIAL CORRESPONDENCE

SYNOPSIS—Conclusions arrived at by the editors of Colorado's leading newspapers, after an extensive and impartial investigation of the labor situation in the coal fields. Four of the six principal demands made by the miners are approved by the press representatives.

⁂

On Sept. 23 the coal miners of southern Colorado went on strike. The next few weeks were marked by unusual acts of violence, which caused Governor Ammons to call out the troops. Thursday, Nov. 13, editors representing 25 of the leading papers of Colorado met in Denver for the purpose of learning all the facts possible in connection with the strike. Governor Ammons told why he called out the troops and what he proposes to do through their operations. Fred Cornwall, Thomas Dennison and A. Lamont, three men on strike, were selected by the strike leaders, and told why they struck and what they are demanding. John C. Osgood, president of one of the large companies gave the operators' side of the controversy, and John McLennan, president of District 15, United Mine Workers of America, told why that organization called the strike. The six addresses occupied six hours. Every speaker was given unlimited time and no interruptions allowed. Following the addresses, the editors went into executive session and adopted the following resolutions, with three dissenting votes:

TO THE PEOPLE AND THE PRESS OF COLORADO, TO THE COAL-MINE OWNERS, AND TO THE COAL MINERS OF THIS STATE:

For the past two months a strike has existed in the coal-mining industry of Colorado. As a direct result of this strike human lives have been sacrificed, many thousands of laboring men thrown out of employment, property destroyed, business conditions have become depressed, the price of coal has been advanced, the reputation and credit of the state at home and abroad is being impaired, and the public at large is being made to suffer beyond accurate calculation. The unfortunate conditions are not in harmony with the peace, prosperity and general welfare that is supposed to be guaranteed to all men and to all institutions alike under the constitution of the state and of the United States.

For the purpose, therefore, of trying to arrive at a method of assisting in terminating this industrial conflict between the miners and the mine owners in a manner which will be in accordance with the laws of Colorado enacted to regulate the coal-mining industry, the newspapers of Colorado represented, acting on behalf of the general public, have met in Denver, and after hearing the arguments and statements of representatives of the coal-mine owners, of the coal miners, and of the United Mine Workers of America, and a statement from the governor of this state, and having given extensive consideration to each and every one of these statements, and having weighed their effect fully and carefully, the newspapers represented have agreed upon a general and united policy of action, to be recommended to the press of Colorado, with reference to the termination of this strike, based upon the authority of the existing state laws.

Before stating our conclusions, we desire first to state the cause of the strike, viz., the demands made by the miners upon the coal-mine owners of Colorado, which are as follows:

The Demands of the Miners

First: We demand recognition of the union.

Second: We demand a 10 per cent. advance in wages on the tonnage rates and the following day-wage scale, which is practically in accord with the Wyoming day-wage scale.

Third: We demand an eight-hour work day for all classes of labor in or around the coal mines and at coke ovens.

Fourth: We demand pay for all narrow work and dead work, which includes brushing, timbering, removing falls, handling impurities, etc.

Fifth: We demand check-weighmen at all mines, to be elected by the miners without any interference by company officials in said election.

Sixth: We demand the right to trade in any store we please and the right to choose our own boarding place and our own doctor.

Seventh: We demand the enforcement of the Colorado mining laws and the abolition of the notorious and criminal guard system which has prevailed in the mining camps of Colorado for many years.

Concerning Recognition of the Union

First demand—Recognition of the union.

With reference to the first demand, we submit the following facts and conclusions:

The question of the official recognition of any labor organization or labor union by any employer or employers of labor is a question not reached or controlled by law, but must be mutually desired by both employer and employee to become a recognized reality. In other words, if employers do not desire to recognize a labor union as an organization in the employment of members of that union, there is no law upon the statute books which can or will compel them to do so.

We have come to the conclusion, therefore, that the first demand made by the miners is not one which can be arbitrated by any body of meditators, for the reason that, as stated above it must be a matter mutually desired and agreed to by employer and employee. However, so long as individual workmen in the employ of coal-mine owners desire to belong to a union, they have a perfect right to do so. This right is guaranteed them by the laws of the state, and, therefore, this first demand for official recognition of the United Mine Workers of America, as such, should not be further pressed by the members of that organization in accepting a declaration on which this strike should now be terminated. However, the right of the miners to belong to a union under the authority of the state of Colorado should be recognized and upheld, and should not be objected to by any employer of labor.

With Reference to a Wage Increase

Second demand—A wage increase of 10 per cent.

Fourth demand—Additional pay for additional and varied work.

In our judgment these two demands should be merged into a single demand, especially as both the second and fourth demands contemplate a higher net income in wages for the miners, and our conclusion is, therefore, that these demands should be consolidated and considered under one general proposition.

With reference to this general wage demand, therefore, our conclusions are as follows:

The amount of money a miner can earn depends on the amount of work he can or is willing to perform. In a published advertisement over the name of the United Mine Workers of America which recently appeared in the Denver newspapers, a statement was made to the effect that all the miners wanted was "a LIVING WAGE and the enforcement of the laws affecting the coal-mining industry."

The question very properly arises, therefore, as to what should be considered a living wage.

The average wage earned by the individual coal miners working in all parts of Colorado, as published in the advertisement of the coal-mine owners, we find to be approximately $4 per day, practically $105 per month, and working eight hours a day or less if they choose. This is said to include the wages earned by good, bad and indifferent miners. The wages of some miners is said to run as low as $2.25 per day while other miners individually earn over $7 per day.

A comparison of the average coal-miner's wages for the entire state, of $4 per day, with the wages earned by other classes of laboring men in Colorado who are equally skilled with a coal miner, shows that if the average wages of all coal miners in Colorado is $105 per month, they are now being paid in our belief what has been referred to as a living wage; in fact, that they are already being paid a wage entirely in keeping with the wages paid for other classes of labor in Colorado.

Present Wages Said to Be Sufficient

Therefore, taking the miners at their published word, we believe that their original demand for a 10 per cent increase over the present Colorado scale, and which was later modified in their advertisements to a demand for living wages, has already been met by the payment of the existing scale of wages for mining coal in this state and which is higher in the net wages earned than in any other state. Therefore, this, the second and fourth demand upon the part of the United Mine Workers of America for living wages is now being given the miners by the coal-mine owners.

Third demand—An eight-hour day for all classes of labor in and around the coal mines and at coke ovens.

This third demand is one which is guaranteed to miners employed in underground mines by the laws of Colorado. If the laws of this state have been disregarded in the employment of labor in the coal-mining industry, it is the duty of the governor to enforce this law, and in this he should be heartily supported.

Therefore, our conclusion with reference to the third demand on the part of the miners employed in underground mines is that it should be guaranteed to them in accordance with the laws of this state.

Fifth demand—Check weighmen at all mines:

This, the fifth demand, is another to which the miners are clearly entitled, and which is guaranteed to them under the law. If this law has not been enforced, or if the miners have not taken advantage of their rights under it, it is the duty of the governor of Colorado to guarantee the enforcement of this law.

Right to Trade Wherever They Please

Sixth demand—The right to trade at any store:

This sixth demand, also, may or may not have been accorded the miners by the mine owners. It is a demand, however, which should be guaranteed to them, for the reason that the laws of Colorado provide that no coercion shall be practiced by any coal-mine owner against any miner in the buying of his household supplies. Therefore, this sixth demand should also be guaranteed to the miners under the provisions of the laws relating thereto.

Seventh demand—General enforcement of Colorado mining laws, abolition of guard system:

This seventh and last demand upon the part of the miners is not open to discussion, so far as that portion of it which relates to a general enforcement of the Colorado mining laws is concerned; for, without question, the miners are entitled to receive the full benefit guaranteed to them under the mining laws of this state.

So far as the employment of police or mine guards is concerned, this practice during periods of peace is maintained solely as a matter of police protection against ordinary disturbances and against possible damages to property in times of petty brawls which are of ordinary occurrence in many mining camps; and so long as these guards or police are maintained upon a company property for the purpose of preserving the peace and to protect that property, there is no good or legal reason for their removal. With the exception of this portion of the last demand of the miners, our conclusion is that the seventh demand, for general enforcement of the mining laws of Colorado, is clearly right, and should also be guaranteed to the miners by the full power of the laws of this state.

Therefore, after mature and careful consideration of all the factors in connection with this strike, we hereby make the following declaration:

That the strike which has prevailed in the coal-mining industry in Colorado should be called off under the following terms and conditions, viz.:

First: That the miners should waive their first demand, which is for a recognition of the union, on the ground that the recognition of any union must necessarily be a matter of mutual agreement and not of coercion, and not being covered by any law; and for the additional reason that the laws of Colorado guarantee to every miner the right to belong individually to any labor organization without prejudice or discrimination on the part of any employer of labor.

Second: That the miners should waive their second and fourth demands for an increase in wages, not only for the reason that the wages now paid to coal miners in this state are larger than in most other states, and are as large as paid in most other lines of industry in Colorado, but also for the reason that the modified demands of the miners, as published in the newspapers, asking for living wages, are in our opinion, already met, being paid by them in cash, twice a month, by the coal-mine owners.

Third: That the miners are entitled to have granted their demands, in accordance with the laws relating thereto, designated as follows:

Third Demand: For an eight-hour work day in all coal mines.

Fifth Demand: For a check weighman in all mines where they ask, to be selected from among the miners by the miners, to be paid by them, and without interference upon the part of the operators.

Sixth Demand: The right to trade at any store.

Seventh Demand: The demand for the enforcement of all laws relating to the coal-mining industry.

Also, that all competent striking miners who have not been guilty of violations of the law while in strike should be taken back by the coal-mine owners without prejudice.

Also, that any coal-mine owner has a legal right to employ any person or persons without interference or threats upon the part of any other person or organizations, as provided by law.

Also, that we declare it to be the duty of the governor of this state to compel the enforcement of the state mining laws, to which we pledge our earnest support ad coöperation; and that, to obtain for the miners every right to which they are entitled under the law, the rigid enforcement of the state laws is alone necessary.

Commend Governor for Sending Troops

We commend Governor Ammons for sending troops into one disturbed district of the state, and express our full confidence in the integrity of his purposes respecting the unfortunate industrial strife that exists there. However, we believe that troops should be adequate in number to become sole protectors of life and property in sections of the state where such strife exists or is threatened, and that the National Guard should be recruited to meet conditions as they may arise. That it is our opinion that until such time as the National Guard may safely be withdrawn from the affected districts and law and order restored that all offenses and violations of law pertaining to the strike should be immediately tried before military courts.

We further request the governor to take such action as will prevent the importation of firearms into this state by any individual or any organization, because we believe that no one has a right to bear arms here except those legally authorized to do so under the laws of the state of Colorado.

Thus it will be seen that we have found in favor of the miners in four of the six general demands they have made and have recognized their right to work as union.

That in declining to side with the miners in the other two demands as stated, we have concluded that the miners are already receiving living wages; and have, at the same time, found for the miners in their first demand, by insisting that one of the conditions under which this strike is to be called off is that all competent miners shall have guaranteed to them under the provisions of the laws of the state the right to belong to any organization without prejudice or discrimination on the part of any employer, which means their right to work as union miners on the open-shop plan.

Therefore, in the interest of the miners, of the coal owners, and of the general public, we hereby declare that this strike should be called off under the conditions stated above, in order to insure the future development of the coal-mining industry of Colorado and the peace and prosperity of its people.

In the carrying out of this policy by the governor of this state, we pledge the support of the editors and papers here represented and ask for the coöperation of all our fellow-editors in Colorado, who could not conveniently come to this conference, in support of such policy.

Also, that a copy of this declaration be furnished to the officials of the United Mine Workers of America, a copy to the coal-mine owners, a copy to the governor of Colorado, and that copies be sent to the press of this state for the purpose of advising the people concerning what we believe to be a just and fair declaration under the terms of which this strike should now be immediately called off and industrial peace restored, and that we pledge ourselves to support this declaration, based on law enforcement, in the editorial columns of our newspapers.

Coal Operators Accept Editors' Proposition

Denver, Colo., Nov. 14, 1913.

Messrs. John C. Shaffer, Frank S. Hoag, H. E. Bowden, L. C. Paddock, Fred Marvin.

Gentlemen:

The undersigned, coal-mine operators, are in receipt of a copy of the proceedings of the conference of editors held in Denver, Thursday, Nov. 13. In this statement you specify the conditions suggested by the editors under which the coal-miners' strike in Colorado should be terminated. We agree to comply fully and in good faith with the conditions suggested by you in said statement.

When the operators receive the protection from the civil authorities for the men who desire to work and for their properties to which they are entitled; are not interfered with in employing men to take the places of those who are now on strike and who left before the strike was called, and are enabled to operate their mines under normal conditions to normal capacity, on the open-shop principle, which has prevailed in Colorado for more than 30 years, we will put into effect the scale of prices for coal heretofore prevailing.

Sincerely,
COLORADO FUEL & IRON CO.,
J. F. Welborn, President.
ROCKY MOUNTAIN FUEL CO.,
D. W. Brown, Vice-President.
THE VICTOR AMERICAN FUEL CO.,
J. C. Osgood, Chairman
Board of Directors.
OAKDALE COAL CO.,
SOUTH CAÑON COAL CO.,
F. B. Lewis, President.
LEYDEN COAL CO.,
MOFFAT COAL CO.,
F. A. Perry.
Representing operators mining 95 per cent. of the coal produced in Colorado.

Open Letter to Miners and Operators

To the Coal Operators' and Miners' Unions of the United States.

Gentlemen:

As president of the American Mine Safety Association I consider it my duty (as well as a pleasure), to call your attention to this "joint movement" for safer mining in the United States and to invite you to join and support it. This organization is one that should receive the moral and financial support of every miner and operator in the country regardless of any and all other considerations. Associate membership can be secured by any coal company or any organization, local union, or group of mine workers at a cost of $10 per year. Can you afford to fail or refuse to take out such membership? Make your application now to H. M. Wilson, 40th and Butler Sts., Pittsburgh, Penn., who is secretary-treasurer.

Hoping this appeal will not be in vain, I beg to remain,
Yours for safer mining,
JOHN P. REESE,
President, American Mine Safety Association.
Gillespie, Ill., Nov. 17, 1913.

COMING SOCIETY MEETINGS

The Coal Mining Institute of America will hold its winter meeting at the Fort Pitt Hotel, Pittsburgh, Penn., Dec. 4 and 5. C. L. Fay, Wilkes-Barre, Penn., is secretary.

West Virginia Coal Mining Institute will hold its winter meeting at Charleston, W. Va., on Dec. 8, 9 and 10. Neil Robinson, Charleston, W. Va., is president; E. N. Zern, Morgantown, W. Va., is secretary.

An International Exposition on Safety and Sanitation will be held Dec. 11 to 20, at the Grand Central Palace, under the auspices of the American Museum of Safety. Dr. Tolman, of 29 West 39th St., New York City, is director general of the exposition.

The Rocky Mountain Coal-Mining Institute has decided to postpone indefinitely the November meeting which was booked for Denver. This decision is due to the serious strike situation which now exists in Colorado. F. W. Whiteside, Denver, Colo., is secretary.

Kentucky Mining Institute will hold its mid-winter meeting in the College of Mines building of the State University at Lexington, Monday, Dec. 8, 1913. T. J. Barr, Lexington, Ky., is secretary.

The Second Annual First Aid Contest given under the auspices of the American Mine Safety Association, local union No. 730, U. M. Wof A., and the Superior Coal Co., will be held at the Colonial Theater, Gillespie, Ill., Tuesday, Dec. 9, 1913.

Explosion at Acton No. 2 Mine, Alabama

By a Staff Correspondent

SYNOPSIS—The explosion though severe enough to mutilate frightfully several men, did not even stop the fan, which was allowed to continue circulating the air after the disaster. Fortunately, there was no fire, as a result of the explosion, so the passage of air only assisted the work of rescue which was completed in 12 hr. The mine was not dry and the explosion is to be attributed to the use of black powder in excessively heavy shooting from the solid.

⁂

Twenty-four men lost their lives in an explosion which occurred at Acton No. 2 mine, of the Alabama Fuel & Iron Co., on Nov. 18, at about 3:45 p.m. The mine is located in Shelby County, about 24 miles south of Birmingham, Ala. Only 29 men were in the mine at the time of the explosion, and this alone accounts for the low death list. Monday was payday and, following the usual custom in Alabama, most of the men loafed the day following. Of the killed, 13 were Americans; 2, Italians; 1, a Greek and 8 were negroes.

The explosion occurred at firing time. Several of the men rescued report that they heard two shots in quick succession and following the second shot, the explosion occurred. The exact point where the explosion originated, or its cause, have not yet been determined, but much evidence points to a windy shot having set off a small pocket of gas or dust in the 8th left heading.

Not a Dry or Gassy Mine, But Coal Was Shot from Solid by Black Powder

The mine has never been considered dangerous, as it generates very little gas and only an average amount of dust; besides this, the mine is naturally damp, drops of water always standing on the roof, near the working face, and some of the haulageways being rather muddy. The danger lay, however, in the manner of shooting the coal, solid shooting with black powder. For this condition, the Alabama Fuel & Iron Co. cannot be censured, as practically all the mines on the same seam are operated under similar conditions. No explosive has been found to give as effective results, from the miner's standpoint, as black powder, and until a state law prohibits solid shooting with this explosive, no single company can take a firm stand. Another dangerous practice, which is also common to most Alabama mines, may have had some effect on the force of the explosion; namely, the presence of nearly full kegs of black powder in several of the entries. As against this, however, little evidence of flame was discovered, and the coked particles usually found sticking to mine props, after explosions, seemed to be absent.

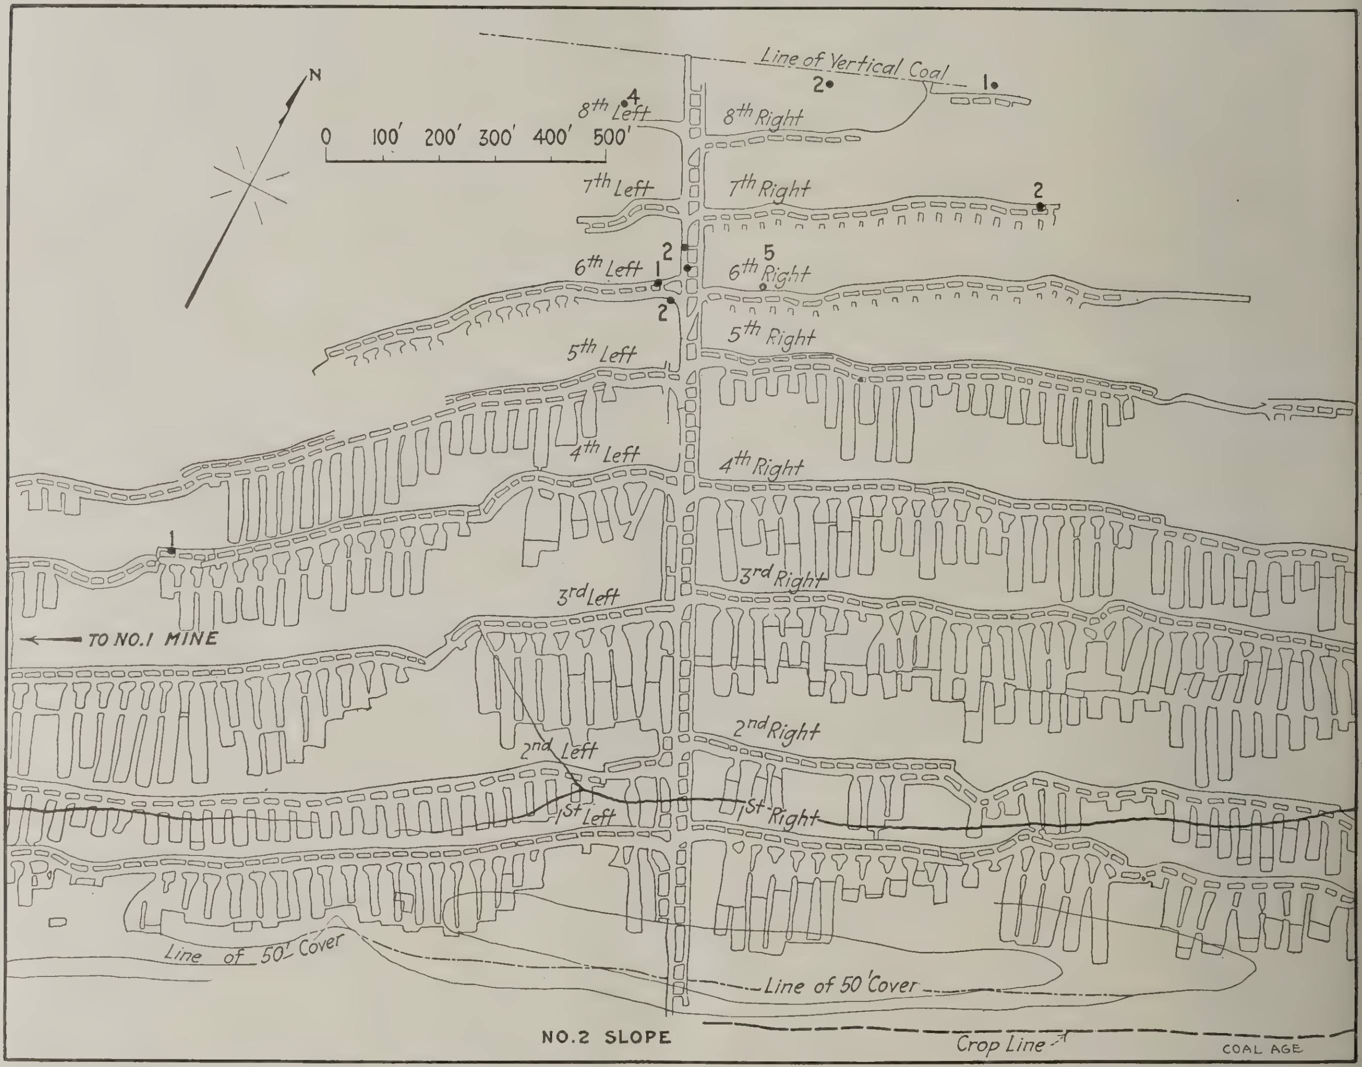
View of Tipple at the Acton No. 2 Mine

Immediately after the explosion occurred, Chief Mine Inspector Nesbitt was notified by telephone, also the government mine-rescue station and the Tennessee Coal, Iron & R.R. Co.'s rescue crews. E. B. Sutton, in charge of the federal station, was absent, at the time, but H. H. Hamilton, of the DuPont Powder Co. took charge of the government's automobile rescue car and hurried to the scene, piloted by an automobile carrying Chief Mine Inspector C. H. Nesbitt and Charles DeBardeleben, vice-president of the Alabama Fuel & Iron Co. The rescue car of the Tennessee Coal, Iron & R.R. Co., accompanied by 18 trained helmetmen, was started out as a special, by the Louisville & Nashville R.R., at about the same time. The automobile arrived a few minutes ahead of the railroad car and within a few hours of the time of the explosion.

The Fan Was Not Stopped by the Explosion and Was Kept Running

The three helmet crews of the Tennessee Coal, Iron & R.R. Co., composed of five men each, under the direction of J. W. Groves, instructor, formerly of the Bureau of Mines, and John Meagher, general superintendent of mines, J. R. McCue and Angus Brown, immediately took charge of the exploratory work, inside the mine. This work was less difficult than in any previous explosion in the state, due to the fact that the mine fan was not injured by the explosion and did not even stop running, and very little damage was done to the inside of the mine. Another aiding condition was the air connection through to No. 1 slope, which remained unobstructed. In fact, the explosion was not felt in No. 1 at all.

No men were found alive in the mine, by the helmet crews, four, of the five survivors of the explosion having walked out unaided, before the arrival of the rescue crews, and the fifth man was rescued by a party formed under the leadership of Ed. Husband, of Eureka mine, after the arrival of the helmet crew, but before they had entered the mine. The connection to No. 1 mine through the 4th left of No. 2, made it possible for this crew to explore that heading, and it was in this entry that the fifth survivor was found.



Map of Acton No. 2 Mine. The Black Dots and Numerals Show Location of Bodies and Number of Men Killed

The Rescue Crews Worked Only 12 Hr., and Found All the Bodies

The rescue crews remained on the scene only 12 hr., and in that time penetrated practically the entire mine and found all the bodies. It would be hard to conceive of greater possible efficiency than that displayed by these trained men. Crews under the direction of Supt. J. G. Steele, followed behind the helmet crews and brought the bodies of the victims to the surface and restored the brattices along the haulageways. E. B. Sutton, in charge of the Birmingham federal mine-rescue station, who was deprived of the honor of accompanying his car on its first trip, arrived a few hours after the car and remained on the scene offering assistance, until the car was no longer needed. Edwin Ball, manager of mines of the Tennessee Coal, Iron & R.R. Co., and Robert Hamilton, chief engineer, also hurried to the scene and proffered aid. C. H. Nesbitt, chief inspector, remained on the scene, directing the work until all the bodies were recovered.

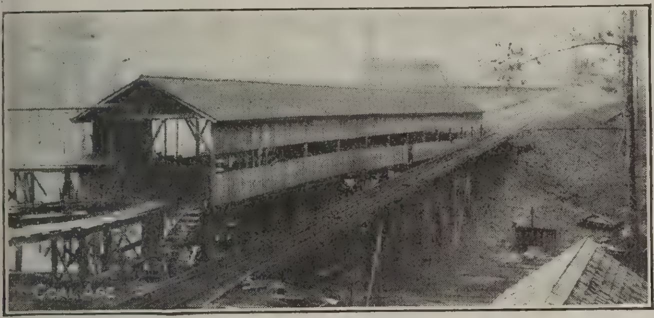
As Usual, More Succumb to Afterdamp Than To Violence

Apparently 15 of the killed owe their death to afterdamp; the balance met death instantly and several of the bodies were frightfully maimed. One of the men who survived the explosion, owes his life to the fact that he became confused and wandered into an air course, while his companions attempted to travel the main haulageway and were overcome. Three mules were in the mine at the time of the explosion and two of them were killed.

The bodies of the dead miners were found at points in-icated on the map: One on 4th left, two on 6th left, four n 8th left, five on 6th right, two on 7th right, one on 8th ght, two on 9th right and seven along the main slope and ir course. The map was last posted July 1. Since that ime, the headings have progressed at the rate of about 00 ft. per month.

A High-Volatile Coal on a Steep Pitch

The coal at Acton is being mined from one of the ahaba seams, which averages about 4 ft. thick and itches at an angle of about 20 deg. As indicated by the map, the mine is worked on the room-and-pillar system, the coal being loaded out of the rooms by means of chutes. The coal is hauled to the surface on a single-track slope. The average analysis of the coal is as follows: Fixed carbon, 58.87%; volatile matter, 34.35; ash, 5.34; moisture, 1.44; sulphur, 0.51.



Showing Approach to the Acton No. 2 Tipple

The mine has a fairly good slate top and is similar in every way to most of the mines in the Cahaba basin. The coal is noncoking and is used largely for domestic and steam purposes. Ordinarily, the mine employs about 75 men and produces a daily output of 300 tons. In 1912, the mine produced 87,859 tons of coal.

Commissary at the Acton No. 2 Mine

All the officials of the Alabama Fuel & Iron Co. extended every courtesy to newspaper men and all others who asked for information. They also exerted every effort to alleviate the sufferings of the widows and orphans. The mine will resume operation, as soon as chief inspector Nesbitt completes his examination into the cause of the explosion. Most of the brattices and overcasts will have to be rebuilt.

Program of Winter Meeting, Kentucky Mining Institute

Meeting Called to Order at 1:30 P.M., Monday, Dec. 8, 1913.

ADDRESS OF WELCOME:
By Judge Henry S. Barker, President of the State University.
RESPONSE:
By W. L. Moss, President of the Institute.
PAPERS:
"The Clinkering of Mixed Coals Under High Temperatures,"
By R. D. Quickel, Fuel Agent of the Cincinnati Southern Railway.
"Problems Encountered in Mining Coals in the Western Coalfield of Kentucky.
By Newell G. Alford, Assistant Engineer of the St. Bernard Mining Company, Earlington, Ky.
"The Use of Gasoline Motors in Coal Mines,"
By W. C. Whitcomb, General Manager of the Geo. D. Whitcomb Company, Rochelle, Ill.
"The Oil Fields of Northeastern Kentucky,"
By Dr. S. R. Collier, West Liberty, Ky.
"Safeguards in the Use of Electricity in Mines,"
By Prof. W. E. Freeman, State University of Kentucky.
"The Bearing of Coal Mining on Local History,"
By Otto A. Rothert, Louisville, Ky.
ADDRESS:
"The Importance of the Coming Session of the Legislature to the Mining Industry of the State,"
By Senator Joseph F. Bosworth, Middlesboro, Ky.

⁂

Coal in the Ancient Lake Beds of Montana

The presence of coal in the tertiary lake beds of verdant valleys in western Montana, has been known locally for many years. Some of these localities have experienced short coal booms, most of which, however, died before the mineral was developed. At the present time, however, systematic mining is being carried on near Missoula.

Coal of the type found in this region has, until recently, been thought worthless, because only such fuel as would coke or stand shipment without slacking was considered of commercial value. In this part of the West where high-grade coal is scarce, where the cost of wood has reached $6 or more per cord, and soft coal imported for domestic use, sells for about $8 per ton, the demand for cheaper fuel is great, and the development of these heretofore unused low-grade coals is becoming profitable.

That these low-grade coals may furnish gas of good quality at a moderate cost, and briquettes suitable for domestic fuel is suggested by the result of experiments with coal of a similar type recently carried on at the University of North Dakota by E. J. Babcock. For this reason an investigation of the resources of parts of Missoula, Ravalli, Granite, Powell, Deer Lodge and Silver Bow counties, in western Montana, has been made by the U. S. Geological Survey in order to obtain data for the classification of the public lands in this area, and to supply the public with information about the coal.

Though a local demand for cheap domestic fuel will cause some further development of these Montana coals, anything like a rapid future for them will depend on an increased use of producer gas for the generation of power, for which these coals seem suited, or the introduction of briquetting machinery which will convert the easily slacked coal into briquettes that may be shipped and stored without deterioration.

EDITORIALS

The Formation of Coal

In another part of this issue we give Doctor Bergius' theory of the formation of coal. He states that anthracite is formed from bituminous coal by extreme pressure accompanied by heat, and that heat without compressive stress cannot convert "soft" into "hard" coal in any period of time, however great. All this he attempts to prove by exposing cellulose to suitable temperatures and pressures.

It is but fair to regard as essentials to the acceptance of his conclusions, certain other positions, some of which he does not take, but which are absolutely to be ascribed to him for they are essential premises to his argument. He may shirk to state them, but if he does not admit that he gives them credence, he vitiates his whole argument and makes his conclusions quite unconvincing.

First, he must either assume that cellulose must be so large a constituent of peat that its reactions are representative of the chemical changes which peat is likely to undergo or else he must affirm that the other bodies in peat despite their dissimilarity of composition must, after certain changes in the earlier stages, eventually pass through the same chemical reactions as if in the first instance they had been cellulose.

We are not disposed to regard cellulose as such a predominant constituent of peat, and we question, moreover, whether that carbohydrate was not already considerably changed by the slow action of ferments before it was materially heated. That this is a fact can be seen by comparing the composition of cellulose with the revised percentage compositions of the following peats from which the ash and nitrogen are supposed to be removed.

Materials	Hydrogen	Carbon	Oxygen
Thèsy peat	6.30	55.45	38.25
Camon peat	6.82	52.41	40.77
Hör in Schonen peat	6.96	55.07	37.97
Cashmere peat	6.31	57.41	36.28
Average of 10 peats	6.57	56.46	36.97
A heavy brown peat (J. Websky)	6.91	63.43	29.66
Cellulose ($C_6H_{10}O_5$)	6.17	44.45	49.38

It will be seen that peat contains a trifle more hydrogen, much more carbon and much less oxygen than cellulose. And in passing let it be remarked that any investigation of the metamorphism of coal is lacking in completeness and therefore in accuracy if it does not consider all the five elements entering into the coal substance, viz: Carbon, hydrogen, oxygen, nitrogen and sulphur. They are evidently not inert to the chemical changes and the last two are not uncombined with the first three and must, therefore, hold some of those elements outside the cellulose bond.

As for the alternative that all is grist coming to the mill of Nature and that resins and humic bodies in the end become like cellulosic bodies under similar treatment, every evidence shows it is not true, and Doctor Bergius has not tried to meet the allegation with refutal by experimenting on other bodies beside cellulose.

The second difficulty is that granting he has produced bodies from cellulose with the same percentage of carbon, hydrogen and oxygen as is found on determining these elements in dry and ash-free coal, then how are we to know that he has not obtained merely an isomer of that fuel and not the coal itself? Nor can we know that this similarity in composition is not the result of the existence in coal of a multiplicity of bodies such as Doctor Bergius tries to deny. Because the product of cellulose is one and indivisible, the learned doctor would have us say, if he has been correctly quoted, that "the formation of coal is a thoroughly uniform, comparatively simple and very characteristic chemical reaction." While this may be true of the cellulosic imitation of coal, yet it is most untrue of that fuel as we find it.

The third difficulty with which Doctor Bergius is beset arises from the fact that his theory rests on the mistaken idea that in bituminous coals there is a certain proportion of hydrogen and carbon and that for anthracite there is another definite relation between these elements. Doctor Bergius claims he has made bituminous coal and anthracite. In the table below we show how uncertain are his evidences. If soft coal contained just 84.8 per cent. of carbon and 4.8 per cent. of hydrogen, and anthracite 87 per cent. of the former and 3.9 to 4.4 per cent. of the latter, we could feel that perhaps Doctor Bergius had lighted on a remarkable coincidence. But his success is not so obvious when the following tables are considered, based on the Bureau of Mines bulletin, entitled "Analyses of Coals in the United States." The figures in this bulletin we have modified so as to exclude sulphur and nitrogen from the analyses and yet bring the total up to one hundred by raising the percentage of carbon, hydrogen and oxygen in due proportion.

Place	State	Fuel Ratio	Hydrogen	Carbon	Oxygen
Lignites					
Tesla	N. D.	0.87	6.21	76.00	17.79
Williston	N. D.	1.06	4.99	73.51	21.50
Sub-bituminous					
Lafayette	Colo.	1.16	5.41	78.05	16.54
Bituminous					
Mineral City	Ohio	1.17	6.19	83.14	10.67
Pittsburg	Okla.	1.32	5.38	85.42	9.20
Blossburg	N. M.	1.60	5.67	86.55	7.78
Bruceton	Penn.	1.61	5.56	87.28	7.16
Dr. Bergius' incarbonized cellulose		....	4.80	84.80	11.40
Semi-bituminous					
Greenwood	Ark.	4.90	4.09	94.60	1.31
Paris	Ark.	5.00	4.42	93.82	1.76
Semi-anthracite					
Bernice	Penn.	9.05	3.83	93.96	2.21
Anthracite					
Scranton	Penn.	10.22	3.23	93.98	2.79
Tower City	Penn.	25.81	3.14	94.41	2.45
Minersville	Penn.	33.13	2.30	95.08	2.62
St. Nicholas	Penn.	76.52	1.80	96.03	2.17
Cranston	R. I.	14.97	0.80	95.92	3.28
Portsmouth	R. I.	28.07	0.38	95.08	4.54
Dr. Bergius' artificial anthracite		....	4.4 to 3.9	87.00	9.1 to 8.7

Perhaps we do not agree with Doctor Bergius as to what constitutes anthracite, and some coals which we term bituminous, he would not so regard. But our greatest difficulty has been to find a fuel having the percentage composition he gives for anthracite or bituminous coal, and as will be noted, we have calculated a number of samples in order to test their values with his. True Stein's and Klasen's results are wider from the mark than those of Bergius, but we must confess that to our mind even the latter has sent his shaft so wide of the target that his conclusions cannot be accepted.

Those who would sweep away the evidence that coal is complex body and matures with time must produce better proof than Doctor Bergius has adduced. As opposed to his belief that the carbon, hydrogen and oxygen content of coal is a unit carbohydrate, we have the fact that several solvents will dissolve parts of it and not inconsiderable parts either. Carbohydrates in the original peat mass may become other specific carbohydrates in the coal, but we cannot admit that the coal itself or the peat from which it comes can be cast into a common unit molecular formula. To an analytic chemist, the unity described by Doctor Bergius, as seen through a synthetic window seems to be entirely lacking.

The belief that coal is maturing is favored by the gas found occluded in it. The surrounding conditions under which coal is now found are the same under which to all intents and purposes it has existed thousands of generations, yet it is still full of gas. If the coal has been stable for those centuries, the gas cannot have been formed during that time and would surely by this time have leaked away. The gas which comes from the coal in the Appalachian regions, Doctor Bergius would have us believe, was manufactured some time in the Carboniferous, Cretaceous or Tertiary ages, and has been bottled up since that time, the more recent erosions not being deep enough in places to permit the gas stores to escape. How much easier is it to believe that the gas is more recent and is the result of reactions now taking place, because most of the deposits are comparatively shallow?

Of course, it is conceivable that the writer of the abstract in the *Montanistische Rundschau* may have misrepresented Doctor Bergius and converted an hypothesis into a proof and the closing remarks in the article tend to assist in that conclusion, but, look at the statements as we may, we face always the difficulty that, on Doctor Bergius' finding, not even a surmise along the lines he indicates could permissibly be based.

⁂

Mining Classes and Schools

It is gratifying to note the work that is being done in a humble and practical sort of way, in different mining districts, by superintendents and mine foremen who are earnestly endeavoring to improve the conditions and increase the knowledge of the men in their charge. Most of this work is being done without compensation or reward, further than what comes from the increased efficiency of the worker.

Word has just come to us of another effort of this kind, known as the Camp Bulah School of Mines. This school has been taught for 1½ years by Mine Foreman Jonathan Foster, at Camp Bulah, near Midland, Ark. Mr. Foster is a graduate in the coal-mining course of the I. C. S. system. He has had 28 years of practical experience, in the coal field in which he is located; and has served in every capacity from trapper to mine foreman. He knows the field thoroughly and his men.

The Camp Bulah school is located in the heart of the district. The miners have become so interested in the work that they have bought a nice library for the use of the students; and the work of teaching the theory and principles of coal mining is meeting with admirable success. Mr. Foster teaches five nights in the week free of charge.

Another school of which we have been recently advised is that taught by Prof. J. F. Drummond, at Filbert, W. Va. Professor Drummond is employed, for this purpose, by the United States Coal & Coke Co. The school is well attended by the miners, and the results thus far accomplished have been very encouraging. There is no charge made for tuition, and the interest that is taken in the work by all classes of employees in and about the mines is remarkable. It is stated by one of the students that Professor Drummond "is an able instructor."

Supt. W. W. Harding, who is responsible for the establishment and work of the school, is reported to have said that he expects to make this one of the best schools of its kind in the state.

⁂

The Underpaid Miner

It appears to be a popular misconception that the coal miner is the most poorly paid and most grievously oppressed mortal existing upon this mundane sphere.

However much of truth there may have been at one time in this hallucination, the fact remains that many a man of only reasonably good physique who can and does work at loading coal in the mines, earns wages which make the "salary" of many a clerk, bookkeeper, minister and other "professional" man appear like the proverbial "thirty cents."

In many regions of West Virginia, for instance, miners who work in what might be termed good average places receive from $5 to $10 per day, and not a few men are highly disgusted when their day's earnings fall below $8. In these mines almost any man who will "pitch in and shovel" can make anywhere from $125 to $200 per month, the amount depending almost entirely upon his own industry.

There are two standards by which compensation for services rendered may be measured. The first of these considers only the man's earning capacity, while the second takes cognizance of his savings. Other things being equal, he who earns $50 per month and is able to save $10 therefrom, is in better shape financially than he who, while earning $150 during the same period, is able to save only a lesser amount.

Compared with the average man who barters his time and his talents for a monthly stipend, the coal miner is as fortunate in the matter of expenses and living conditions as he is in that of his wages. In many, perhaps most mining towns today, the living conditions and expenses compare favorably with the average of those of the big cities. Rents, lights, water and fuel may be had for prices which are merely nominal.

With reasonably good economy and thrift, the miner who is willing to eschew strong drink and work regularly and efficiently, even though he may support a large family, is enabled to lay by for the inevitable rainy day a tidy little sum, ranging from $10 to $50, or even more, each month.

A comparison of the incomes and savings of miners and that of teachers, preachers, clerks, bookkeepers and the like—in fact the majority of that large class of people who consider all manual labor as degrading and look upon the white collar as a mark of distinction and their vested right—cannot fail to reveal the balance in favor of the coal digger.

SOCIOLOGICAL DEPARTMENT

An Important Factor in Modern Industry

By Fred H. Rindge, Jr.*

This is a bit of philosophy which I like to call the theory of the five "C's": "Commerce is dependent upon Capital, Capital is supplemented to a large extent by Credit, Credit in turn is based upon Confidence, and Confidence in the last analysis depends upon Character." There we have the full quintet—Commerce, Capital, Credit, Confidence, Character—and I am writing this article because industry and the Young Men's Christian Association have a common basis in character. One needs and the other produces character. What produces character is bound to promote efficiency, which is one of the leading demands of the age.

What Causes Well Meant Schemes to Fail

With this "economic apologetic" for the work of the Young Mens' Christian Association in industrial fields, it is interesting to note the remark of a prominent manufacturer, who says "The financial interests of my corporation require that I shall do everything possible to improve the workers' character, efficiency and friendliness." Realizing the importance of these things, many employers have wisely decided to put money into welfare work, and the improvement of working, living and recreative conditions surrounding their operatives. Some of these schemes have been very successful, others have failed. If we analyze the failures, however, we will always discover some fundamental reason.

Some companies, for example, have put thousands of dollars into welfare work, apparently without any very lasting result, and have had severe strikes on their hands. Why? Because the employer has probably gone at the work in the wrong way; he has been too paternalistic. Every box of "output" which has gone out of the factory has had a label on it, "We do so and for our men." Workingmen resent this sort of thing. As one workman has well put it—"I would rather have self-respect and some dirt than to be advertised under improved conditions." I heard one labor leader illustrate the point very well, though rather inelegantly, when he said: "The trouble with some of the so called welfare work is that the employer gives his employee no choice in the matter but rolls the whole thing up into the form of a pill and says 'Here, damn you, take it.' "

Betterment Work Should Be Co-operative

Nevertheless, attempts such as the ones described are worthy even though unsuccessful, and have had their place in the present great industrial betterment movement. The truth is, as many experienced employers testify, that to be truly successful, welfare work must be coöperative. The employees themselves must be given a share in it. The Young Men's Christian Association in industrial communities furnishes one admirable basis for welfare work, in which the vital principle of coöperation is given due regard.

Employees pay down their own money for membership privileges, the employer contributes his share, and the men elect their own board of directors. The Y. M. C. A. belongs to the employees as well as to the employer. A carefully trained secretary is provided to supervise and promote the work. The local association derives the great advantages resulting from its relation to the State and International Committees and from the more than 2100 other branches in North America. The association is operated and supported by the employers and employees of the cotton, lumber, coal and other industries, and is also effectively at work on railroads representing 80 per cent. of the railroad mileage of the United States, in the construction camps, and even in those built by the Government Reclamation Service.

An Extension School of the Scranton Y. M. C. A. at Greenwood, Penn.

The scheme above outlined works. It builds character. It promotes efficiency. It makes right relationships. It yields dividends. One coal operator says: "By actual statistics the output of coal from our mines dropped 10 per cent. every Monday after the dissipation of the men on Saturday and Sunday. Since the putting up of the Y. M. C. A. building, the men have had a decent place in which to spend their leisure time, and the output has been greatly increased." That's the kind of "religion" that appeals to every employer.

What Has Been Done

Regardless of creed or religious affiliation, note the following from prominent employers:

Judge Elbert H. Gary, chairman, Board of Directors, United States Steel Corporation, says: "I am glad to declare my belief in the advantages of having a Young Men's Christian Association in an industrial community as tending greatly to the building up of the character of the men, and, therefore, increasing their efficiency.

Frederick Lewisohn, president, Tennessee Copper Co., states: "I am greatly impressed with the manner in which the Young Men's Christian Association, of Ducktown, Tenn., has established itself and from what I have observed it is very gratifying to all concerned as it helps very much in banding the employees together in good fellowship."

---

*Secretary, Industrial Department, Y. M. C. A., 124 East 28th St., New York City.

Dr. J. A. Holmes, director of the Bureau of Mines, says: "I am interested in the Y. M. C. A. work because during the last twenty-five years as I have passed up and down through the great mining camps of Pennsylvania, I have seen the great work which the Y. M. C. A. is doing. I have seen places transformed through its work."

C. A. Cabell, general manager of the Cabin Creek Coal Co. and Carbon Coal Co., writes: "The results obtained by establishing the Young Men's Christian Association at Decota, W. Va., for the benefit of the employees and families in the service of the Cabin Creek Consolidated Coal Co. and Carbon Coal Co., have far exceeded my expectations. It has raised the old men as well as the young from low and injurious amusements to those of a higher and more cultivated character.

"The consumption of spiritous liquors has been reduced more than 50 per cent. So far as I am able to ascertain, gambling among the whites has practically been eliminated. It has raised the standard of good citizenship, the bad element have left because they could not stay and prosper. The Sunday school, Bible classes and entertainments wherein the entire family participate have unquestionably created a desire on the part of all for cleanliness. This applies especially to the children.

Teaching English to a Class of Foreigners by the Roberts Method

"If we were starting a new operation today such an institution as is now located at Decota would be one of my first considerations."

Practical Improvements Introduced by Association

Such a testimony certainly tells the story, and many others might be given if space permitted. The activities of coal-mining associations are exceedingly practical; therefore, the results are seen in practice. In one mine an explosion of gas seriously burned two men. Two others who attempted rescue were overcome by the afterdamp. A miner trained in the Y. M. C. A. first-aid class crawled into the entry with his face close to the ground and dragged out the four men one by one. He then showed his friends how to administer artificial respiration, dressed the burns and saved the men's lives.

The association has taken an active part in the "safety-first" propaganda. In the National Mine Safety Demonstration in Pittsburgh, sixteen of the forty teams coöperating were organized and prepared for the contest by the mining department of the Pennsylvania State Y. M. C. A. The association also coöperates with the American Red Cross Society and the U. S. Bureau of Mines in the constant extension of first-aid training and English instruction to foreign miners.

Other lines presented which are of great practical value are educational classes of all kinds, Bible classes, illustrated lectures, clean moving-picture entertainments, indoor and outdoor games, campaigns against tuberculosis, flies, mosquitoes, etc., "Clean-up" campaigns, village fairs and picnics, "safe and sane Fourth of July celebrations," boy scouts, promotion of flower gardens and home beautifying even in barren surroundings, thrift and savings features, etc. In all this work the employer usually provides the building and an annual maintenance contribution and the employees voluntarily pay about the same amount in small membership fees. The only place where the scheme has failed is where it has not been tried.

What Collegians Do for Association and Their Adequate Returns

One of the most interesting developments of the past five years has been the Industrial Service Movement of the Association, which has enlisted during the past year alone 3500 college students, mostly engineers, in volunteer service for industrial workers. This movement is growing rapidly and already reaches from coast to coast, banding 160 college industrial communities in many kinds of helpful service.

Perhaps the most significant part of this movement is the benefit which these coming engineers themselves derive from the service they render—and as one employer expressed it—"They surely need it." A general manager said to me the other day, "The college graduates in my employ are a confounded nuisance. They come to us with a special knowledge of theory and materials, but when they begin to deal with the men of the shop they make a mess of it. They don't understand the men and don't handle them right."

Thus we are again reminded of the importance of this human factor in industry, and the Industrial Service Movement helps to meet this very need in the life and training of a coming engineer. As these students teach foreigners English, lead educational classes, and do any one of forty different things which bring them into close personal contact with industrial workers they learn to know the men, to understand them, to get a vision of their needs and a sympathy which will make for larger humanity after they graduate from college and get into positions of industrial leadership.

How the College Graduate Wears off His Exclusiveness

Thus we are constantly receiving letters from many of the 3000 interested engineering graduates which breathe this spirit of larger service. Let me quote from a few:

> When I got here in the construction camp, I treated my men with due consideration and was amazed at their response. Other foremen had labor difficulties, but my men went out of their way to say good night and good morning to me and at the close of the job they thanked me for the way I treated them and wanted to work for me always.
>
> As a student I got interested in industrial service and resolved then that any men whom I might later control should get a square deal. I have just investigated the living conditions of my men out here in the lumber camp and found them sleeping on old vermin-producing wooden bunks that had not been changed in six years. I had the whole outfit burned up and an iron cot put in for every man in camp.
>
> Enclosed please find my personal check. I want to put English classes in my steel mill.
>
> We have put in a fine welfare club for our men with reading, writing and smoking rooms. No gambling or liquor allowed. It certainly pays and I am delighted with my share in it.
>
> A few of us have signed up 800 working men for a Y. M. C. A. membership and are anxious to have a building and secretary as soon as possible.

These are perhaps not *big things* but they are significant of the great good that will be accomplished as hundreds of these engineers graduate from college each year with a larger vision and a determination to serve.

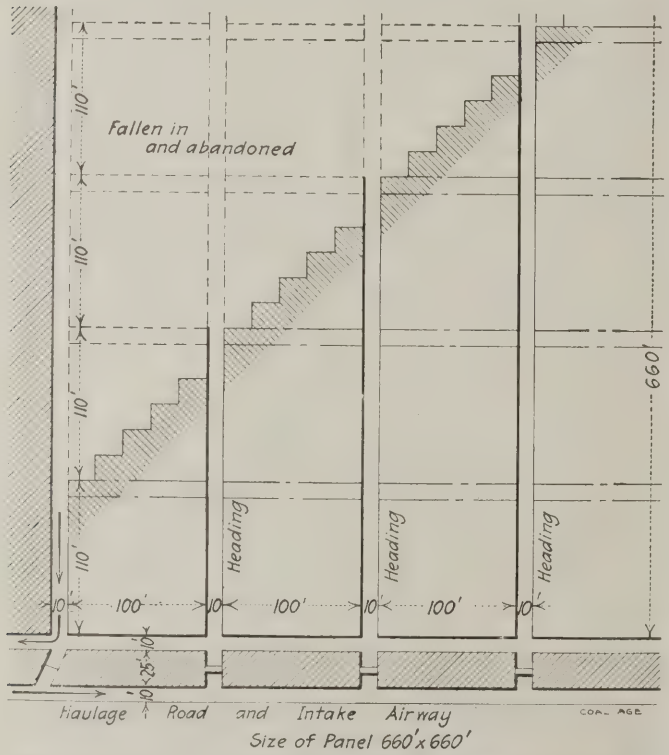
DISCUSSION BY READERS

Working Coal under Sandstone Cover

Letter No. 1—In reply to the request for suggestions, in reference to the best method of working coal under a hard sandstone cover, Coal Age, Nov. 15, p. 745, I would say that the conditions described in these inquiries are peculiarly difficult to counteract, in the mining of coal.

Unless a suitable method of working is adopted and the mine laid out in accordance thereto, much trouble is liable to be encountered by reason of "squeezes" or "creeps." This is especially liable to occur in the case mentioned, where the cover varies from 400 to 1000 ft. in thickness and the coal is underlaid with a soft stratum of fireclay that has a tendency to heave.

Under these conditions, unless sufficient precautions are taken in the start, there is bound to result a loss of thousands of tons of coal and much timber and iron will be buried beneath heavy falls of roof, and a large expenditure of money will be required for special cribbing. The case presents the combined difficulties of a hard roof that will not break readily and a soft bottom that tends to heave when the weight comes on the pillars. Exposure to air and water always softens a fireclay bottom, which is forced upward by the pressure on the pillars.



Retreating, Longwall-Panel System of Mining

In my opinion, the best system to adopt under these conditions is the "block system" of mining, better known, perhaps, as the "panel system." This system is illustrated by the portion of a mine shown in the accompanying figure. Butt headings are driven to the rise of the cross-entries. These headings are driven on 110-ft. centers and made 10 ft. wide, so as to leave pillars 100 ft. wide between the headings. The pillars are crosscut, each 110 ft., the crosscuts being, also, 10 ft. wide. In this manner, the entire panel is divided into square blocks of coal 100x100 ft. The entire mine may be thus divided into panels, say 660 ft. square. Each panel should be worked out separately, and each heading should be driven one block in advance of the succeeding heading.

As shown in the figure, the headings are driven to the limit of the panel, and the blocks of coal worked out successively, on the retreating system. It is important to keep the line of pillar work uniformly straight, so as to avoid any undue pressure being thrown on the pillars. In the figure, the pillars are shown as being worked in steps; but this will depend largely on the nature of the coal, in reference to its cleavage planes. The method has proved successful, under like conditions, many times in the past; and there is no reason but that, with proper precautions, it can be successfully applied under the conditions described.

George Stockdale.

Percy, Penn.

Letter No. 2—I noticed the inquiry, Coal Age, Nov. 15, p. 745, in regard to the best method of working under a hard sandstone roof when the bottom is soft, in order to secure the largest possible recovery of coal.

For the past 12 years I have been operating under a condition of this kind, and find that the best method of handling the same is to leave pillars of a thickness sufficient to avoid any possibility of squeeze. I have found that the best plan, in the room-and-pillar method, is to take out not more than 30 or 35 per cent. of the coal, in the first working. This leaves from 65 to 70 per cent. of pillar coal to support the roof, and makes it almost impossible for a squeeze to occur.

When this plan is adopted, the coal taken out in the first working is, at least, sufficient to cover the cost of operation; but the greatest profit is realized in drawing back the pillars. The system is somewhat after the longwall-panel system of mining; but differs from that in the fact that when a break occurs, in retreating, and the working face is lost it is more easily regained than in the longwall system. It is important to keep the line of pillar work straight; that is to say, one pillar should not advance more quickly than the other.

Another plan I have found to work very successfully whenever the conditions will permit, is the following: A pair of double entries are driven directly up the pitch, where this does not exceed a 4 or 5 per cent. grade. Rooms are turned to the right and left of these entries, on the strike, of with a slight rising grade of, say 1 or 2 per cent., if desired. The butt entries should be turned from 650 to 700 ft. apart, so as to give ample space for breaking the hard roof. About the same percentage of coal is taken out in the first working as before, and the rooms are driven until they meet those turned off the next pair of headings. They should meet about midway between the two pairs.

When a sufficient number of rooms have been driven up to insure a good break, the pillars are crosscut at the face, and the work of retreating is begun. As before, it is necessary to keep the line of pillar work straight, so that no pillar will project under the roof and retard the break. I have found this method even more successful than the one first described, in respect to economy of working and ventilation. It provides two good airways for the intake and return currents; and, as the rooms "hole" through into each other, the course of the air is shortened.

MINE FOREMAN.

⁂

Education and Training of Mining Men

Mining men who have the interest and safety of their men at heart, and who value their safety above a few tons of coal, are earnestly seeking for means and methods of operating coal mines that will produce the greatest degree of safety, and render the mines more immune from accidents. These mine officials have their eyes open to the fact that safe and sanitary conditions in mining, are paying investments. The growing demand for safer methods in mining, coming as it does from men of experience and intelligence, enlists the best talent and efforts of men to produce the measures demanded. Brains and practical experience working in harmony, will finally solve the problems and produce the safer measures required. Development in the mining industry has progressed rapidly, until the problems and conditions that confront the operator, today, are of greater magnitude than those of any period in the history of mining, and require more thought and greater effort for their solution. In proportion as safe and practical conditions in mining are demanded by mine officials, to that extent will they be produced and maintained in daily practice.

In an editorial, COAL AGE, Oct. 18, p. 585, this statement is made: *"Today, the recognized cornerstone of all effort for improving conditions in coal mining is the practical training and education of mining men."* A greater truth relative to the problem of improving mining conditions was never uttered. In that direction, the active student will find the key that will unlock for him the door to many mining problems; and, as a result, the more practical methods for safe mining will be better known and more extensively used.

Mining knowledge has made rapid advancement in recent years. Improvements in mining machinery and many plans and methods for the prevention of accidents in coal mines have been developed. But all knowledge of mining has not yet been achieved, nor all possible improvements accomplished, or safety methods and measures in mining perfected. Not far back in the history of mining, little was known of many factors and conditions confronting the operator that are now better known and understood.

Formerly all explosions occurring in coal mines were attributed to gas, as this element was known to be explosive. But explosions would occur at times and under conditions precluding the theory of gas explosions. Common sense dictated that the cause must be assigned to something else. What could it be? Research soon revealed the startling fact that dust was a very dangerous factor in coal mines, and would produce a disastrous explosion, under favorable conditions. Is research and investigation to stop here? Are gas and dust the only elements that will produce explosions in coal mines? Are there other causes and conditions in mines that will produce disastrous results, at times? We must not sit down satisfied with achievements already attained, but must earnestly and persistently endeavor to ascertain whether agitated and disturbed atmospheric conditions in coal mines, will produce violent results, in the absence of both gas and dust.

The question of safety in mining when solved or better understood, will not consist in some new and wonderful discovery yet to be made, as some mining men seem to think, but will be attained mainly by a better use of the knowledge we have already acquired, and by the strict observance of means and methods already known. If we will judiciously use the knowledge we have acquired as the result of experience, education and training, we will have gone far toward the solution of many problems of danger in mining and will discover measures of greater safety.

It is said that "eternal vigilance" is the price of safety in any occupation; but it is certainly true in coal mining. The superintendent, who is aware of his limitations, and realizes how little he realy knows of things that affect the safety of mining and help to make the mine immune from accidents, is a safe official, and one who is generally on his guard against disaster. Too great confidence in means and methods pursued, or an overestimation of the safety plans adopted relaxes the attention and may frquently be the cause of mine disasters that, with greater care and vigilance, could have been prevented. The more practical mining men continue to weigh and consider the unsettled question of means and methods for reducing mine accidents to the lowest possible degree, the more prudence and discretion they will possess; and as these essentials in mining increase, presumption will decrease and order and system prevail.

Others cannot know things for us as well as we can know them for ourselves. Miners who think and know for themselves, are better enabled to enlarge their circle of knowledge by the experiences and researches of others whose opportunities for acquiring knowledge have been greater than their own. In proportion as miners know and understand the causes producing dangerous conditions in mining, and the means of neutralizing and arresting these dangerous conditions as they arise, the more interest will they take in the farther research of these things, and the more value will they place on the knowledge attained.

To the degree that miners value their lives and the lives of others about them, to that extent will accidents in coal mining grow less. The miner who places a high value on life, takes few risks and is the safe miner. The uneducated and reckless miner is the greatest source of danger in mines. The education and training of miners will result in many improvements in mining conditions, and prove to be the cornerstone on which systems of safety in mining will be erected, and great mine disasters will then become matters of history.

JOHN ROSE,
District Mine Inspector.

Dayton, Tenn.

To Prevent Gas and Dust Explosions

I was interested in the excellent article of A. G. Hahn, Coal Age, Nov. 8, p. 709, relating to the prevention of gas and dust explosions. It reminded me of a little incident that occurred where I worked some years ago and which shows the careless manner in which places generating gas are often safeguarded.

The fireboss who examined the place and found a dangerous quantity of gas, simply put an empty powder keg in the road and placed a small piece of dirty wooden rail on top of it, with a rather doubtful mark "gas." This was the only caution placed there to prevent anyone from going unwarned into the gas. The ventilation throughout the mine was poor, the fan being taxed to the limit of its power. This condition, later, caused an explosion, which would not have occurred had the company provided sufficient power to properly ventilate the mine.

My plan is always to have a good current of air passing, especially in the winter season. The quantity of air circulated in a mine should fulfill the requirements of the mining law. The thermometer is an important factor in determining the quantity of air. Regard should always be had to the temperature, in order to properly regulate the air current, in a dry and dusty mine. When the zero point is reached in the outside atmosphere, the air current in the mine always has more drying power; and it is necessary, at such times, to use greater precaution.

It is also important to observe carefully the reading of the barometer and to observe whether the atmospheric pressure is increasing or decreasing. A falling barometer presents a condition that is generally accompanied by a greater inflow of gas into the workings than when the barometer is rising; and at such times greater precaution is necessary in regard to the use of safety lamps.

Besides these conditions, there are some practical points that should be carefully borne in mind. When driving headings in solid coal (virgin territory), as when developing a new area, it is important to keep a careful watch for gas. The same or even greater caution should be used in rooms opened off such headings. Faults of any kind, either in the top or bottom of the seam, such as "slips," "spars," "clay veins," etc., generally yield a fresh supply of gas. A good current of air should be maintained, in driving all such places.

In working a very gaseous seam, it is often a safe precaution to keep a drill hole in advance of the heading, so as to drain the gas from the face of the coal as much as possible. A good water system should be maintained at the working face, in all gaseous mines.

Robert W. Lightburn.

Adelaide, Penn.

Study Course in Coal Mining

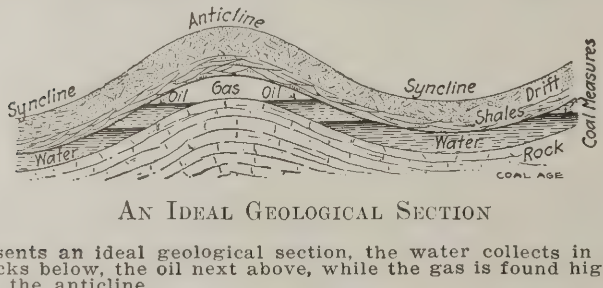
By J. T. Beard

The Coal Age Pocket Book

Natural or Feeder Gas—All gas formed and contained in the strata is called "natural gas," in distinction from gas manufactured in the industries. Natural gas commonly occurs in large volume, in coal formations, where it accumulates in cavities or pockets and in crevices in the strata. The gas coming from such pockets and crevices is termed "feeder" or "blower" gas.

GEOLOGICAL CONDITIONS

Gas, Oil and Water—The strata of the earth's crust form a great natural reservoir for gas, oil and water. These collect in the formations, in the order of their relative densities. As illustrated in the accompaying figure, which represents an ideal geological section, the water collects in the rocks below, the oil next above, while the gas is found higher on the anticline.



An Ideal Geological Section

This condition is only true, however, in a general way, depending on the nature of the strata and their power to absorb and hold these elements. Water, and oil to a less extent, find their way by gravity to a "hard-pan" or stratum impervious to them; while gas drains to the surface and escapes, unless confined by an overlying stratum of clay or impervious rock. The subterraneous drainage of water and oil, from the overlying rocks into the synclinal basins, creates enormous pressures, which are exerted more or less equally on the water, oil and gas.

Water Level—In every geological section, there is a more or less defined "water level" or depth at which water is found in quantity. Wells or boreholes sunk to this general level strike a usually abundant supply of water. The same is true, but to a less extent, of oil, in oil regions. The flow of oil, in oil-bearing rocks, however, is not as free as that of water, owing to its viscosity and limited supply.

The water level is not constant, but varies according to the changing supply or surface drainage, being higher in wet seasons and lower in seasons of drought. As the oil floats on the water any change in water level is accompanied by a similar change in the oil supply. It is due to this fact that exhausted oil wells often become productive in a season of flood, and producing wells frequently cease to flow in a prolonged season of drought.

The Coal Age Pocket Book

HYDROCARBON GASES

General Formulas of Hydrocarbon Gases—Carbon (C) and hydrogen (H) unite in different ways to form groups of compounds, having certain distinct characteristics. Such are the "paraffins," represented by the general formula $C_nH_{2n} + 2$; the "olefines," C_nH_{2n}; the "acetylenes," $C_nH_{2n} - 2$; and other compounds of less importance in mining, as the "benzenes," "naphthalines," etc.

Occurrence and Formation—Methane (CH_4) and ethane (C_2H_6), which will be described later, belong to the paraffin or fatty group, while olefiant gas (C_2H_4) belongs to the olefine or oily group. These are all products of the destructive distillation of organic matter. Methane is often seen bubbling up from the bottom of stagnant pools, in marshes, which fact suggested the name "marsh gas." It is the result of the slow decay of the vegetable matter (in the presence of water), at the bottom of the pool.

On the other hand, olefiant gas is the result of the dry distillation of gas from organic matter, which takes place less frequently in the strata, owing to the almost invariable presence of moisture. The character of these hydrocarbon gases, moreover, varies, also, with the kind of organic matter that undergoes decomposition.

Of the hydrocarbon gases, the paraffins (methane and ethane) are the ones chiefly occluded in the coal measures; while olefiant gas, belonging to the olefine group is rarely found even in minute quantity. Beside the hydrocarbon gases occluded in coal, as has been stated, varying quantities of nitrogen, oxygen and carbon dioxide have been absorbed.

Condition of Gas Confined in Coal—The results of careful experimental study of coal indicate (Chamberlin) that gas may exist in coal in three different ways: 1. The gas is occluded, in a true sense, or absorbed (possibly condensed) by the coal. 2. The gas is entrapped or held mechanically in the cavities, cracks or pores of the coal. 3. The gas may result from chemical changes going on in the coal.

Escape of Gas from Coal—Experiments made by the Bureau of Mines, by crushing weighed samples of different coals in closed vessels of known capacity, show that coal continues to give off gas for a long time after it is mined. The gas is liberated more freely during the crushing of the coal, which would indicate that much of the gas is held mechanically within the mass. It is also shown that the coal continues to absorb oxygen from the air, during the same period.

Composition of Feeder or Blower Gas—A large number of analyses of gas issuing from coal seams as "feeders" or "blowers" have been made. Gas has also been obtained by drilling holes several feet into the face of the coal. These analyses show a wide variation in the composition of the gas in different localities. Moreover, since the rate of emission of gases varies, the composition of feeder gas is only suggestive of the contamination of the mine air from this cause. An analysis of gas taken from a 10-ft. borehole in the Dorrance Colliery, near Wilkes-Barre, Penn., gave: CH_4, 94.2; N, 3.3; CO_2 1.1; CO 0.1; C_2H_4, 0.4; O, 0.9.

EXAMINATION QUESTIONS

Elementary Questions

(Suggested for Beginners)

ARITHMETIC

Ques.—What is the daily output of a mine under the following conditions: Time of hoisting, 8 hr. per day; coal hoisted per trip, 5200 lb.; time required per hoist, 50 sec. and, changing cars, 22 sec.?

Ans.—The total time per hoist is $50 + 22 = 72$ sec. Making no allowance for delay, during the day, the total number of hoists is $(8 \times 60 \times 60) \div 72 = 400$. The weight of coal hoisted per day is, therefore, $400 \times 5200 \div 2000 = 1040$ short tons.

Ques.—If 12 men mine 720 tons of coal in 20 days, working 9 hr. a day; how many tons of coal will 9 men mine in 25 days, working 8 hr. a day?

Ans.—The weight of coal mined is proportional to the number of men working, the days worked, and the hours per day. Therefore, the ratio of the weight of coal mined is equal to the ratio of the men, times the ratio of the number of days, times the ratio of the number of hours per day; or, in this case, calling the required weight of coal mined x

$$\frac{x}{720} = \frac{9}{12} \times \frac{25}{20} \times \frac{8}{9} = \frac{5}{6}$$

$$x = 720 \times \frac{5}{6} = 600 \textit{ tons}$$

GASES

Ques.—What is a gas?

Ans.—A gas is an aëriform fluid, distinguished from a vapor only as being invisible, while vapors are visible, appearing as a fog, mist or cloud.

Ques.—Name the important mine gases, giving the symbols of each.

Ans.—Methane, or carbureted hydrogen, commonly called marsh gas (CH_4); carbon dioxide, formerly called carbonic-acid gas (CO_2); carbon monoxide, formerly called carbonic-oxide gas (CO); hydrogen sulphide, or sulphureted hydrogen (H_2S); olefiant gas, called also ethylene or ethene (C_2H_4); ethane (C_2H_6); besides the nitrogen (N_2) and oxygen (O_2) of the air.

Ques.—Describe briefly the different "damps" known to miners.

Ans.—"Firedamp" is any inflammable or explosive mixture of marsh gas and air, containing frequently varying quantities of other mine gases. "Blackdamp," called, also, "chokedamp" or "stonedamp" is any mixture of incombustible gases heavier than air, the mixture consisting chiefly of carbon dioxide and nitrogen. "Whitedamp" is generally understood as referring to carbon-monoxide gas. "Stinkdamp" is a term used by the miners in reference to hydrogen sulphide. These damps are all more or less mixed with air.

Ques.—Write the chemical equation expressing the reaction that takes place when methane, or marsh gas, burns in oxygen; and show the relative volume of oxygen and methane required for complete combustion; also the volume of carbon dioxide and water vapor produced by the combustion.

Ans.—Following is the equation expressing the reaction that takes place:

$$\begin{array}{lcccc} & CH_4 + & 2\,O_2 = & CO_2 + & 2\,H_2O \\ \text{Relative volumes} & 1 & 2 & 1 & 2 \end{array}$$

Two volumes of oxygen are, therefore, required for the complete combustion of one volume of marsh gas; and there are produced, as a result of this combustion, one volume of carbon dioxide and two volumes of water vapor.

Ques.—If two volumes of oxygen are required for the complete combustion of one volume of marsh gas; find the relative volume of air consumed for each volume of marsh gas burned.

Ans.—Since oxygen forms 20.9 per cent. of air, the relative volume of air, per volume of marsh gas burned, is $2 \div 0.209 = 9.57$; or, practically, 9½ volumes of air are required for the complete combustion of one volume of marsh gas.

Ques.—What effect has carbon dioxide on a firedamp mixture?

Ans.—Carbon dioxide is an incombustible gas and, by diluting the firedamp mixture, reduces its explosiveness. It is generally stated that if carbon dioxide is added to a firedamp mixture at its most explosive point, the volume of carbon dioxide required to render the firedamp inexplosive is about $^1/_7$ of the volume of the firedamp.

Ques.—What effect has coal dust on a firedamp mixture?

Ans.—The presence of fine coal dust floating in the air has the effect to render the firedamp mixture more easily ignitable and widens the explosive range. Mixtures of methane and air that would not otherwise be explosive, therefore, become explosive in the presence of fine coal dust floating in the atmosphere.

Ques.—Why is coal dust dangerous when allowed to accumulate in mine workings?

Ans.—Under the drying influence of the air current, moisture is absorbed from the dust, which is then easily blown into the air by any consussion, such as a blownout shot or fall of roof. Dust is also raised in large quantities by the ordinary operations of the mine, such as the movement of cars, the passing of men and animals in the traveling ways, etc. The fine dust of the coal, also, readily absorbs oxygen from the air, which increases its inflammability. A sufficient quantity of fine dust floating in the air is often highly explosive without the presence of gas, especially if the coal is inflammable. For these reasons, accumulations of coal dust are dangerous.

Ques.—Are all coal dusts alike inflammable, and what kind of dust is generally the most inflammable?

Ans.—The fine dust of bituminous coal is more inflammable than that of anthracite, because of the larger percentage of volatile combustible matter contained in the coal. The soft bituminous coals also disintegrate more rapidly under the influence of the air than is the case with the harder anthracite.

COAL AND COKE NEWS

Washington, D. C.

Active proceedings before the Interstate Commerce Commission with reference to the proposed 5 per cent. increase in the rates of railroads in official classification territory were opened before the Interstate Commerce Commission on Nov. 24, and bid fair to continue a good while. The first addresses were made by Daniel Willard of the Baltimore & Ohio R.R. and F. A. Delano, receiver for the Wabash R.R. Both men laid especial stress on the financial situation of the roads in official classification territory. Mr. Delano analyzed the classes of freight originating in the section under consideration, and he developed a specially interesting argument with reference to the coal roads, declaring that they could not be classed with other lines operating in the same territory.

The Coal Roads to be Separately Considered

Mr. Delano said: "We have excluded the Pittsburgh & Lake Erie, Bessemer & Lake Erie, Hocking Valley, Kanawha & Michigan, Toledo & Ohio Central, and Wheeling & Lake Erie R.R. These roads are located in a comparatively small area between the Great Lakes and the iron furnaces and coal mines of Ohio, and their traffic is not of a general nature but substantially confined to the products of mining; these products during 1912 forming 78.6 per cent. of their entire tonnage. But the exceptional feature of their situation lies, not only in the volume of this mineral traffic, but in the fact that by reason of hauling iron ore in one direction and coal in the other they have a balanced traffic, which produces an unusually favorable operating condition. While these lines are within the boundaries of the territory, they do not enter into the general railroad situation and cannot be included in a group of roads fairly representative of all the railroads in the territory."

Mr. Delano, however, made no attempt to exclude consideration of the eastern coal roads, although he called attention to the fact that "the combined tonnage of products of mines carried by the Pennsylvania R.R., proper, the New York Central proper, and the Baltimore & Ohio system in 1912 was approximately ten times the same class of tonnage carried by the two principal railroads of New England." It is believed that there will be much controversy with reference to the exact status of the coal roads in the application for rate advances, and as to the extent to which the statistics and experiences of these roads may be taken as typical.

The Paint Creek Investigation

Practical agreement has been reached by the committee which investigated the "Paint Creek & Cabin Creek disturbance in West Virginia" and it is understood that within a week or two a public report will be furnished to the Senate. The information now available is that the committee will assert that American citizens were tried and imprisoned contrary to law, and that martial law was invoked too early. This may lead to a very severe indictment of the Supreme Court of West Virginia.

It will also be found that the mails were interfered with in the coal fields and that the state militia prevented men from getting their mail. The shipment of firearms into the Paint Creek region will also be complained of, and it will be asserted that in taking bodies of strike breakers to the coal fields, peonage was practised.

Coal Lands Restored to Public Entry

The President has restored 242,500 acres of coal land to public entry in Montana and 14,500 in Utah. As a result the coal-land withdrawals have been reduced to 58,000,000 acres. Up to the present 84,000,000 acres have been classified as to their coal value. Out of this area 18,500,000 acres have been declared coal land and valued at $761,000,000, the average price being $41.13 per acre.

HARRISBURG, PENN.

The Interstate Commerce Commission's investigation into the rates and practices of the anthracite coal roads, which was being held at the Bellevue-Stratford Hotel at Philadelphia, was on Thursday adjourned indefinitely owing to the sudden illness of Commissioner John H. Marble who had been presiding. Mr. Marble was seized with an attack of acute indigestion on Wednesday night, the effects of which caused his death at Washington, D. C., on Friday, Nov. 21.

Silas H. Smith, attorney for the commission, announced to witnesses that the investigation would probably not be resumed for two or three weeks, as the hearing of the 5 per cent. advance in the freight-rate case, which begins in Washington on Monday, Nov. 24, may be protracted. Meantime the coal inquiry will wait.

Geo. H. Ross, vice-president of the Susquehanna Coal Co., a subsidiary of the Pennsylvania R.R. was prepared at the time of adjournment to continue his story of the relations between the coal company and the railroad, which he had not completed at the close of Wednesday's hearing.

Representatives of the coal dealers' associations in Ohio, Indiana and Michigan were also prepared to testify. They came to protest against differentials on freight rates, which they claim are against their district.

The counsel for the commission sought to show by witness after witness that anthracite had to pay higher rates than other freight, and operating officials testified in endless repetition of the methods employed in handling coal cars at the various terminals. They told how many locomotives were used, how many empty cars were returned to the region, where the concentration points were and so forth.

It was brought out at the investigation that the Susquehanna Coal Co. has paid but one dividend (4 per cent.) in 12 or 15 years. It owes the Pennsylvania $6,000,000 on which it has given the railroad company no security, but on which it pays 5 per cent. interest. It was also brought out that the Mineral Railroad and Mining Co., another subsidiary of the P. R.R. Co., leased from the Northern entral Ry., another Pennsylvania-controlled railroad, 4900 acres of coal land, on which it has never paid the royalty of 28c. a ton called for in the lease. Mr. Ross further testified that the Susquehanna company makes up the deficits of the Mineral Railroad and Mining Co., and other companies owned by the Pennsylvania.

O. H. Hagerman, shipping agent of the Reading at Port Richmond, Philadelphia, testified that 90 per cent of the cars dumped at Port Richmond are sent away from the docks empty; the other 10 per cent. leave the port with iron ore.

The following are the principal facts appearing in the testimony of the witnesses examined:

Summary of Principal Testimony

That the abolition of free storage has reduced the number of standing cars in the Perth Amboy and South Plainfield yards of the Lehigh Valley by more than one-half.

That the Reading Ry. is in need of more coal cars, but does not get an additional supply because it has no room for storage during slack time.

That only Reading coal is stored in the Clearfield storage plant of that road, although it is supposed to be open to every coal shipper for such purpose.

That only such coal as is ordered is allowed to enter the yards of the Reading at Port Richmond, all other anthracite being detained at the Woodlane yards.

That actual demurrage is charged upon cars not yet placed, though the law states distinctly that such charges cannot be made until the car is in actual placement.

That coal shipped to Buffalo pays $2 a ton freight, the buyer receiving a rebate of 25c. from the railway-owned coal companies, in order that the rate of $1.75 by all-land routes may be met.

That the independent coal companies cannot afford to do this and that in consequence they withdraw from the Central States field almost every winter thus producing an artificial coal famine.

That the railroad-owned coal companies send out a monthly circular fixing prices at identical figures.

Mine Caves

In a test case filed in Scranton, the supreme court will probably be called upon to decide whether a coal company is responsible for injury to person caused by a disturbance of the surface. It is the first suit of the kind to be instituted.

Mrs. James Kirwin, of Scranton, states in her petition that on September 12, 1913, a foreman for the Lackawanna Coal Co. rushed into her house and told her to get out quickly, as they were going to let the house down. She asked him to delay the work for a short time, but in the meantime a shot was fired in the mine and the building sank. The kitchen stove exploded and the castings were hurled about the room, injuring and disabling her. She asks that she be compensated to the extent of $25,000.

The courts have decided that where property is damaged by mining the owner can have no redress, in case he waived his right to collect damages, but no case is known where such caving resulted in personal injury. The outcome of the suit will be awaited with great interest.

The State Highway Department has joined with the Water Supply Commission and the Department of Mines in an effort to check the trouble caused by the washing of culm into streams, in the anthracite region of the state. Great losses have been caused in the past by the constant washing of the culm. Getting into the streams it causes them to fill up, and as this changes the level of the water it makes necessary the constant altering of the roads and bridges along the line of the water courses. Aside from this there is the pollution of the water.

With the idea of finding a way in which a remedy could be applied, an inspection of Shamokin Creek, from Sunbury to Mount Carmel was made by representatives from the three departments recently.

The Lehigh Canal, between Mauch Chunk and Easton, had to be closed for the season, due to the culm and other pollution in the canal, which was washed in by the severe storm of last Sunday. It was deemed advisable to take this course so that the water could be drawn and the bed properly cleaned.

PENNSYLVANIA

Anthracite

Nanticoke—Concrete walls have been erected in a section of the Auchincloss colliery of the Delaware, Lackawanna & Western R.R. Co., coal department, where a mine fire has been raging since last Monday. It is thought that with the erection of the wall the fire will be smothered within a few days.

Pittston—The Pennsylvania Coal Company is about to build a dozen or more homes along the river bank to be occupied by the foremen at No. 14 colliery.

Edgar C. Weichel and George V. O'Hara, foremen for this same company, have commenced their work at the Y. M. C. A. in preparing young men to take the examinations as mine foreman and assistant mine foreman, next spring.

Scranton—Orders have been issued by the Delaware & Hudson Coal Co. to all monthly hands who keep expense accounts that hereafter they will have to dispense with their chickens, cows, pigs and other animals if they want to remain on the company payroll. Various reasons are assigned for the order, but the one most generally accepted is that the expense accounts of such employees have been increasing regularly during the last year or two.

Wilkes-Barre—A miner who has been in jail for several days on a charge of changing tickets on mine cars and having them credited to himself was given a habeas corpus hearing before Judge Fuller on a charge of larceny, and although the evidence of witnesses was strongly circumstantial it was not sufficient to confine him and he was released on his recognizance to appear at the next term of Court.

The defendant was employed in the Dorrance mine and was charged with having his tickets on 30 cars, while it was claimed that he had only been furnished with 16 cars. The arrest was made at the instance of Charles Lahr, check docking boss for the Dorrance local of the U. M. W. of A.

Bituminous

Nant-y-Glo—Fire destroyed the plant of the Springfield Coal Co., on Nov. 15, doing $10,000 damage and throwing 200 men out of employment. Rebuilding was commenced immediately.

Du Bois—The miners of District No. 2 of the U. M. W. of A. declare that the next agreement will require the operators to deliver cars at the face. Seven hundred miners have gone out at the Tyler mine of the Cascade Coal & Coke Co. to compel the rest of the men to join the union.

Burgettstown—The Wabash Coal Co., of Carnegie, has sold all its holdings comprising 3700 acres lying between Hickory and this town to J. A. Bell, of Carnegie for $20 an acre. The principal stock holders are H. J. Verner estate, W. F. Sossong, T. Beadling, F. and M. Bruening, Dushane & Lewis.

Waynesburg—A deed was placed on record in this county during the week transferring 395.04 acres of land in Jefferson Township. The consideration of the deal was $274,000. The property was purchased by the H. C. Frick Coke Co. from the Pittsburgh-Buffalo Co. and comprises the coal underlying 12 tracts of land, part of which faces the Monongahela River. The H. C. Frick Coke Co. also placed of record a deed for 4.05 acres of coal in the same township purchased from the Johnetta Coal Co. for $1000. Both deeds bore the date of Oct. 31, 1913.

WEST VIRGINIA

Mabie—At the request of the stockholders of the Brady Coal Co., Judge Warren B. Kittle, of Elkins appointed A. N. Humphries, of Philippi, receiver for the coal company.

Charleston—Following a conference between representatives of the Kanawha and New River coal operators and President George W. Stevens of the Chesapeake & Ohio R.R., held at White Sulphur Springs, M. T. Davis, John Laing and G. H. Caperton, a committee of the operators left for New York to appear before the board of directors of the railroad to urge immediate action in the improvement of car facilities.

MARYLAND

Cumberland—Surveys are being made for a new railroad through the mountains of Pennsylvania and the little hamlet of Cook's Mills, eight miles west of Cumberland. It is to be known as the Buffalo Coal & Lumber R.R. The line is to open up for development a big section of timber and coal land hitherto untouched by a railroad.

ALABAMA

Gadsden—Captain J. M. Elliott, who for six months has been investigating deposits of coal in Blount mountain, twenty-five miles west of Gadsden, reported that three seams, with a total of 11 ft., have been uncovered at the outcrop and that extensive driling will be undertaken at once.

Birmingham—The only specially equipped motor mine rescue car in the service of the government, arrived in Birmingham recently. This car is built especially for mine rescue work, and can be used to convey injured persons to the hospital. Alabama is practically the only mining section where every mine can be reached by automobile. This car has been attached to the West End rescue station operated by the government, and a trial trip was made recently, to Tuscaloosa and back, a distance of 120 miles, which proved satisfactory in every respect. Accompanying the Engineer in charge, E. B. Sutton, were Chief Mine Inspector C. H. Nesbitt, several assistant mine inspectors, and representatives of the various newspapers. If the car proves a success, it is probable that the government will supply them to their other mine rescue stations in other sections.

It is stated that the Tennessee Coal, Iron & Railroad Co. has recently received several large orders for steel rails, which means that the rail mill will continue in active operation. Their coal mines must be run at full capacity to keep the rail mill supplied with coal.

OHIO

Columbus—Notification by operators engaged in lake trade has been received stating that the American Marine Underwriters will insure lake vessels sailing in December at 1% up to Dec. 4, and 1½% up to Dec. 8, after which vessels will not be insured. These dates are somewhat later than usual and will permit a larger tonnage to be shipped to the Northwest. The vessel owners in certain cases will lay in their boats about Dec. 1 and will take no chances on another trip.

ILLINOIS

Duquoin—A. R. Byrd & Sons Co. of St. Louis have taken options on 17,000 acres of untouched coal land in Perry County, most of which is southwest of this point. According to the present arrangement, a mine will be sunk on the Birkner Farm west of here and another one on the Smith farm southwest of this point. It is understood that the operating company will be capitalized for $850,000.

Belleville—The largest judgment ever paid in the Circuit Court at Belleville was that in the case of Patrick Grannan against Donk Bros. Coal & Coke Co. for $15,000. Grannan suffered a broken back in a mine accident, and at the trial was brought into the court room on a stretcher.

The bursting of the cylinder of the hoist at the Massie mine a week ago has finally caused the operators of this property to install an entirely new hoisting apparatus, and the mine will be shut down for two or three weeks as a result.

Auburn—The Auburn & Alton Coal Co. and 63 other coal operating companies are testifying before Examiner R. T. Eddy of the Interstate Commerce Commission, seeking to obtain an order from the commerce court directing the railroads, chiefly the Atchison, Topeka & Santa Fé, and 48 other connecting lines, to establish a rate for transporting coal from points north of the southern boundary of Christian County to Peoria, Chicago and other gateways to the west and northwest, which will be 15c. a ton less than the rates from points south of that line. The railroads have quite an array of talent to oppose the petition.

INDIANA

Princeton—The Princeton coal mine is tied up by the walkout of the 14 operators of the coal-digging machines. The machinemen asked for a guaranty of $3.34 a day, which has been cut off because the company says some of the men are not giving a full day's work. The men had resumed work several days previously pending arbitration but walked out again, adding to their other demand one that the company furnish a bit carrier to deliver the bits to each machine. The company contends there is no contract for this and it is not customary. Conference between operators and miners was arranged to take place at Terre Haute to consider these grievances. The mine is owned by the Deep Vein Coal Co. of Terre Haute, but is leased and operated by the Princeton Coal Co. About 250 men are employed.

ARKANSAS

Spadra—All the semi-anthracite mines in this section have settled their labor troubles with the exception of one, and it is expected that their controversy will be settled by the first of the month.

KENTUCKY

Morganfield—The Jackson Coal Co., of Fort Branch, Ind., has purchased the old Thomas mine near here, and has announced that it will resume the operation of the property as soon as possible.

Louisville—Suit for damages of $33,290.50 has been filed by the Schwind Brothers' Coal Co. against the Continental Fuel Co., the retail concern alleging that the defendant company failed to comply with its contract to furnish coal to the plaintiff according to orders. It is alleged that shipments were less than ordered to the following amounts: July, 1080 tons; August, 2120 tons; September, 4040 tons; October, 3360 tons.

WISCONSIN

Milwaukee—This year's receipts thus far are the largest on record. About all the dock property suitable for the coal transshipping trade has been absorbed and until harbor development yields more dock frontage, there is little chance for expansion. The last remaining dock site on the South Menominee Canal, which is in the heart of the coal-shipping district, has just been purchased by the Northern Coal & Dock Co., a subsidiary of the Youghiogheny & Ohio Coal Co., an independent producer in the bituminous field. The tract has a frontage of about 275 ft. on the canal and nearly 1000 ft. on a slip adjoining the property on the west. The new dock will be equipped with the latest and best hoisting machinery and ample railway trackage. The Y. & O. Co. now occupies dockage belonging to the Milwaukee Gas Light Co., on the north bank of the Menominee River.

MISSOURI

Whiteside—Arrangements are being made here to establish a fireclay plant taking fireclay and coal out at the same time. The project has been undertaken by James Kelly, representing St. Louis capitalists, and P. M. Modisett, of Hannibal and W. D. Dent, of Oakwood, Mo.

OREGON

Josephine County—The decision of the General Land Office as regards about 9000 acres of coal land entries, in the Squaw Creek section, is awaited with much interest. Representatives of the U. S. Geological Survey have been in the field all summer and fall, having recently completed their work. They found a good grade of coal, some of the samples being of a first-grade coking product. Local men that worked with the Survey state that there is no question but that the land will be allowed to go under the coal act, and if that is the decision of the Land Office it means a new coal field for Oregon. Railroad surveys have been made into this section, to get the land open to entry.

FOREIGN NEWS

Paris, France—Forty-five thousand coal miners are on strike in the Lens district, having responded to the call of the union. The government, fearing serious disturbances, has ordered a regiment of infantry to the vicinity. To end the strike an 8-hr. workday bill was passed by the Chamber of Deputies, Nov. 24, and also another bill making overtime optional.

Halifax, Nova Scotia—An agreement involving 10,000 men employed by the Dominion Coal Co., and represented by the Provincial Workmen's Association, has been reached. The agreement renews the present understanding for three years, or until Dec. 31, 1916. The company has granted an increase of 6 per cent. to all workmen in and about the mines working under $2 per day, making a minimum rate for mine laborers of $1.70 instead of $1.60 per day, and an increase in the minimum rate of the shift men from $1.75 to $1.85 per day.

RECENT COAL AND COKE PATENTS

Gas Producer—H. F. Wallmann, Chicago, Ill., 1,072,536, Sept. 9, 1913. Filed July 21, 1906, Serial No. 327,229.

Gas Producer—J. A. Herrick, New York, N. Y., 1,073,124, Sept. 16, 1913. Filed Feb. 4, 1911. Serial No. 606,548.

Coke Oven Door—H. Kickert, Herringen, Germany, 1,072,857, Sept. 9, 1913. Filed Dec. 21, 1912, Serial No. 738,003.

Coal Loader—P. R. Jordan and W. Wright, Adamsville, Ala., 1,072,731, Sept. 9, 1913. Filed Aug. 22, 1912, Serial No. 716,527.

Automatic Traveling Load Scale—Henry Richardson, New York, N. Y., 1,072,500, Sept. 9, 1913. Filed Mar. 24, 1910, Serial No. 551,347.

Traveling Grate Furnace—S. J. Misener, Woodside, Nova Scotia, Can., 1,073,359, Sept. 16, 1913. Filed Mar. 29, 1912, Serial No. 687,244.

Dynamo-Electric Apparatus for Firing Mines—K. Schaffler, Vienna, Austria-Hungary, 1,072,511, Sept. 9, 1913. Filed Feb. 4, 1913, Serial No. 746,200.

Improvements in Machine for Charging and Discharging Gas Retorts. Riter-Conley Manufacturing Co. 15 Exchange Place, Jersey City, U. S. A., 17,855 of 1912.

Water Cooled Furnace Door Frame—L. L. Knox, assignor to Knox Pressed and Welded Steel Co., Niles, Ohio, 1,073,144, Sept. 16, 1913. Filed Aug. 4, 1911, Serial No. 642,339.

Improvements in the Treatment of Gases from Coke Ovens and of Like Gases and the Recovery of Products Therefrom. W. H. Coleman, 3 Redclyffe Road, Withington, Manchester, 20,900 of 1912.

PERSONALS

Irving R. Gard, for between two and three years with the Canadian Collieries (Dunsmuir) Limited, Victoria, B. C., has retired from that company's employ, the important hydroelectric system and other construction work on which he was engaged being now practically completed.

Official announcement was made from the offices of the Berwind-White Coal Mining Co. at Philadelphia, relative to the resignation of Walter R. Calverly as general superintendent of the mines in this vicinity as follows: "The duties of the position formerly held by Walter R. Calverley at Windber have been divided among the present employees, and the office of general superintendent, as held by him, has been abolished.

John W. Swift, special disbursing agent of the United States navy with the Matanuska coal mining expedition, was in Seattle about the middle of October buying horses, sleds, and other equipment needed for the transportation to a shipping port of some of the coal taken out last summer from the government's experimental mine, in the Matanuska field. It is expected the whole winter will be occupied in hauling the coal to Cook inlet, where it will be loaded on barges.

CONSTRUCTION NEWS

Johnstown, Penn.—The Sunnyside Coal Co. will put electric haulage and machines in their mines.

Carroltown, Penn.—Logan Coal Co. is making extensive improvements at its mines at Beaverdale.

Two Rivers, Wis.—Wisconsin Dredge & Dock Co. have been excavating for the new coal-dock extension here.

Milwaukee, Wis.—The Youghiogheny & Ohio Coal Co. is to expend half a million dollars in the construction of new coal docks.

Rockwood, Penn.—The Consolidation Coal Co. has comenced erection of a new coal tipple at its mines at Wilson reek.

Belle Vernon, Penn.—A new coal crusher is soon to be in-talled at Somers No. 4 mine of the Pittsburg Coal Co., at ricedale.

Carbondale, Penn.—Alterations will be commenced at the ew breaker of the New England Coal Co., which is being rected on the tract formerly owned by the Salem Hill oal Co.

Wellsburg, W. Va.—The Carmichael coal mine, on Bethany ike, about four miles from Wellsburg, will be completely eëquipped with electrical mine machinery, the work to be tarted in a few days.

Birmingham, Ala.—The Tennessee Coal, Iron & R.R. Co. is bout to add to its equipment a 40,000-cu.ft. motor-driven entrifugal air compressor. This unit was recently ordered rom the General Electric Co.

Pruden, Tenn.—The Pruden Coal & Coke Co. expects to install in its power plant a 200-kw. alternating current General Electric generator with 7-kw. exciters, 150-kw. motor-generator set and the necessary switchboard.

Duquoin, Ill.—The Forester Coal & Coke Co. has contracted with the Roberts & Schaefer Co., of Chicago, for coal handling equipment for a new boiler plant at the mine where a Marcus tipple is now under construction.

Vancouver, B. C.—New York capital has been raised for the completing of the Portland Canal & Northeastern Ry., building of which was started three years ago as a private enterprise of Sir Donald Mann. The line will be extended a hundred miles to tap the anthracite coal fields of the Ground Hog Mountain.

McDonald, Penn.—The American Zinc & Chemical Co. is preparing to sink a shaft and operate a coal mine about two miles from Burgettstown. George S. Baton & Co., of Pittsburgh, are the mining engineers. It is believed that this mine will be ready for operation about June of the coming year.

Birmingham, Ala.—The Sloss Sheffield Steel & Iron Co. will build 300 coke ovens of the beehive type at their Bessie mine, in Jefferson County. These ovens will take the place of the battery of ovens at their city furnace in the heart of Birmingham, which the Sloss company has agreed to abandon operating to abate the smoke nuisance.

Rossiter, Penn.—The Clearfield Bituminous Coal Corporation recently purchased from the General Electric Co. equipment for its mine, consisting of two 750-kv.-a. Curtis turboalternators with 17.5-kw. motor generators and 15-kw. turboexciter sets, three 300-kw. motor-generator sets, three 250-kv.-a., three 30-kw., and three 25-kw. transformers, switchboard apparatus, etc.

Columbus, Ohio—The Sunday Creek Co. has started to make new openings at mine No. 301 at Congo, Ohio, which was damaged by a disastrous fire recently. The officials of the company announce that the production of 3000 tons daily has been curtailed for some time. When the fire was discovered another mine known as No. 302 across the creek was sealed and thus saved.

Salt Lake City, Utah—The Utah Fuel Co. expects to add soon to the power-plant equipment at Castle Gate, Utah, a 625-kv.-a. Curtis turbo-generator, a 200-kw., two-unit, three-bearing motor-generator set equipped with Tirril regulator, switchboard, etc. The contract for the above machinery has been awarded to the General Electric Co., both as to furnishing the machines and their installation.

Sandusky, Ohio—Ground was broken recently on the Lower Lake Dock Co.'s premises in West Sandusky, for improvements, which, when completed, will cost nearly, if not quite, $1,000,000. Additional coal-loading facilities are to be installed before the opening of the 1914 navigation season.

In order that it may reap the full benefits of the additional facilities the Pennsylvania R.R. will enlarge its West Sandusky yards so that twice the amount of coal received daily from the mines in southern Ohio and West Virginia at the present time may be stored.

Hudson, Penn.—Plans are underway for the erection of a breaker along the main line of the Delaware & Hudson R.R. The structure will be built for the Wolfe Coal Co. A lease has been secured by this company on a tract of land situated between the Delaware colliery of the D. & H. Co. and Laflin Borough.

The breaker will be equipped with modern machinery. The output of the colliery will be transported from the breaker to market over the D. & H. R.R. and the work of construction will commence as soon as a branch track has been laid.

INDUSTRIAL NOTES

Brazil, Ind.—The American Coal Mining Co. of this city has increased its capital stock $30,000.

Sharon—The Knox Pressed & Welded Steel Co., was recently granted a license to manufacture and sell coal pulverizing equipment.

Hazleton, Penn.—The Harleigh-Brookwood Coal Co. operating mines near Hazleton, has notified the State Department that it had increased its debt from $155,000 to $1,500,000.

Milwaukee, Wis.—The Northern Conveying Machinery Co. has changed its name to the Maniere Engineering & Machinery Co. Its new offices will be 709-10 Manhattan Bldg., Milwaukee, Wis.

Buffalo, N. Y.—J. N. Sechrest & Co., brokers, will finance the proposed railroad and coal mines of the Manchester Mining & Manufacturing Co., the road to extend 65 miles from Barboursville, Ky., to the line of the Louisville & Nashville R.R. at Beattyville.

Bellaire, Ohio—A syndicate of Columbus, Zanesville, and Mount Vernon capitalists are looking over the available coal lands in Belmont County, for the purpose of developing and mining. It is reported that very little available coal land in that section can be found.

Columbus, Ohio—An entry in the state to have the ownership of the Sunday Creek Co. now held by the Hocking Valley Ry. and the Toledo & Ohio Central R.R. Co. dissolved, is expected to be put on the court records soon. At that time steps will be taken to have the stock sold in some manner agreeable to the court.

Hartford, Conn.—The Terry Steam Turbine Co. has just started operating on a 23-hour per day basis, the one hour of idleness being from six to seven in the morning. It is found necessary to do this in order to clear the shop from the present crowded condition, due to congestion of orders during the past few months.

Bangor, Penn.—The S. Flory Mfg. Co. has erected temporary buildings at their works at this place, equipped the same with improved high-grade machinery, and is now ready to take care of orders as in the past. The business will be continued, and permanent buildings erected as soon as possible. The temporary plant was made necessary by the burning of the plant a short time ago.

NEW INCORPORATIONS

Coeburn, Va.—The Litz Coal Corporation, Coeburn, Va., has ben incorporated, with a capital stock of $100,000, to develop coal lands.

Chattanooga, Tenn.—The Pineville Coal Co., of Chattanooga, Tenn., has been incorporated to develop coal properties. Capital stock is $300,000.

Newark, N. J.—The Manufacturing Coal Co. is about to be incorporated. Capital stock will be $50,000, and John T. Harland, Newark, is incorporator.

Farmersburg, Ind.—The Farmersburg Coal Co. has been incorporated with $10,000 capital stock to mine and deal in coal. The directors are Bert Wood, M. McNeely and Ira Drake.

Frankfort, Ky.—Articles of incorporation have been filed by the Independent Ice & Coal Co. Richard Callissi, Mabel McCabe and George W. Steinhauer are the incorporators. Capital stock is listed at $5000.

Akron, Ohio—The Summit Coal & Supply Co. has been incorporated, with a capital stock of $10,000, to deal in coal, grain and feed. The incorporators are Francis Sieberling, J. B. Huber, W. E. Slabaugh, S. A. Allen and James C. Engleman.

Glen Campbell, Penn.—A charter has been granted to the Superior Coal Co., of Glen Campbell, Penn. It is capitalized at $50,000, and the incorporators are H. E. and J. O. Clark and H. J. Ehrlich, of Glen Campbell, and C. S. Hampton and Harry T. Rodenberry, of Philadelphia.

Clarksburg, W. Va.—The Norwood Coal Co., with its chief works in Harrison County, has been incorporated for the purpose of owning land and operating coal mines. It is capitalized at $10,000. Carl L. Horner, C. B. Stout, J. L. Horner, W. H. Wolverton and C. B. Johnson, all of Clarksburg, W. Va., being the incorporators.

COAL TRADE REVIEWS

GENERAL REVIEW

Anthracite strong with the circular being well maintained and some grades commanding substantial premiums. Bituminous moving well on contracts. Prompt market dull but sellers in control. Weather conditions favorable to a large movement and adverse to consumption. Car supply easy in all parts of the country.

Anthracite is strong all along the line with prices generally well maintained and some premiums in effect. Stove coal is the feature of the hard coal market; it is in short supply all over the East, and commands a good price at all points. Production in the mining regions is heavy, but consumption is keeping pace with the output, and no important accumulations are noticed. It is essentially a weather market in anthracite, and indications point to a brisk business shortly.

The bituminous market is stationary but holding moderately firm with prices on a profitable basis. The conservatism of operators in closing contracts when a period of high prices seemed inevitable has left a rather abnormal amount of free coal in the market. In addition to this the bituminous consumers have been threatened so often with a shortage that they are well stocked as a rule, while comparatively mild weather has decreased the consumption. A brisk export business on the Atlantic Coast is helping to relieve the situation, but the general trend is undeniably toward softer conditions, and most agencies are quietly canvassing for orders.

The combined effects of the reduced lake shipping, due to the derangement in vessel movement as a result of the unprecedented storm, a slowing down in iron and steel, as well as general industrial manufacturing and a full car supply permitting uninterrupted operations has resulted in developing a surplus in the Pittsburgh market. Instead of asking a premium on the October circular, most operators are now prepared to shade these prices on spot business. While the market is holding relatively firm, the demand is light; dealers are of the opinion, however, that they can maintain prices providing the warm weather does not continue well into December. Consumers are making every effort to control the market, but no important break has occurred as yet.

Steam business in Ohio continues as active as ever. Retail trade as a rule is flat, but stocks are not heavy, and many dealers are trying to accumulate surplusses. There is still a heavy demand from the Northwest, and lake shippers are making every effort to get all the possible tonnage off before the closing of navigation, Dec. 1; arrangements are being made for continuing some shipping even after this date. The movement at Hampton Roads has been unusually heavy; some of the larger operators are having difficulty in getting sufficient coal to meet their contracts, and there is little in the way of free tonnages to be had.

A continuation of the warm weather has created a soft market in the Middle West, and mines are being forced to reduce operation; steam prices are lower and a cut is threatened in domestic coal. As a rule, however, requirements on contracts are being maintained at a good average, and the situation hinges greatly on the appearance of some winter weather.

EASTERN MARKET

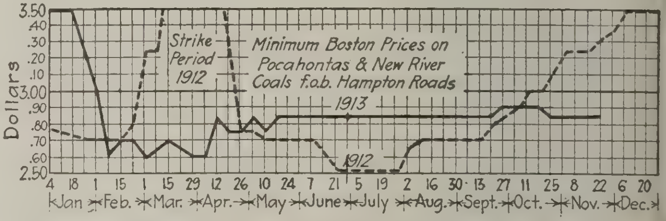
BOSTON, MASS.

Bituminous generally quiet and no near prospect of change. Georges Creek in ample supply but firm in price. Best Pennsylvanias offered freely for spot delivery and this is regarded as significant. Anthracite strong with the lack of stove still the main feature.

Bituminous—This is a listless market and Hampton Roads coals especially are facing a quiet season. New England consumers have more than once this year been induced to buy against threatened shortage and now they find themselves thoroughly well-stocked, in many cases much more so than they wish. There are also signs that some of the agencies are quietly canvassing for orders and there is likely to be an abundance of free coal for several weeks ahead. Some of the shippers were extremely cautious over the amount of contract business they would take in the spring and hence there is probably a larger volume of winter coal available than would otherwise have been the case. There is a more brisk call for export just now and this will help materially to keep the coastwise market steady in the face of light business here.

Georges Creek is moving regularly on contract, but for spot shipment there is only a moderate inquiry. The usual volume of this grade is on hand at all the piers but with no sign of any wavering in price.

Some of the higher grade Pennsylvanias that ordinarily at this season are rigidly confined to contract are being offered for December delivery. This is regarded as significant, and it will not be surprising if soon there is not a slight decline in prices. Coal from districts in Clearfield have been offered at 5@10c. less than a week ago, and although only for prompt shipment, it is probable that extended delivery could also be secured. The trend is toward softer conditions on all the Pennsylvanias and unless something occurs to shorten up the output they will probably continue well into December. All-rail trade is only from hand-to-mouth, with a general lack of interest on the part of buyers.



Anthracite—The market continues strong all along the line, the shortage of stove being still the commanding feature. New York shippers are particularly dry of this size and some pinch prices are likely to be heard when the weather turns cold. It was reported here that 50c. premium had been declined for a straight cargo of stove, but the other sizes are continuing at about the company circular. Little or nothing has developed here with respect to individual coal but a change will come if more stove is not to be had from the regular shippers. The territory East of Cape Cod is still drawing its major supply from Philadelphia. The points farther East have probably been earlier cared for than has been the case in recent years and most dealers away from the cities are going into the winter with comfortable stocks. Tows are moving quite regularly now and the summer temperature has let up on the demand from the consumers.

Quotations on bituminous are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahonta New River
Mines*................	$1.00@1.55	$1.25@1.60	$1.67@1.77

Providence†...........				3.72@3.87

*F.o.b. †On cars.

NEW YORK

Soft coal unchanged but rather dull. Mining continues at full rated capacity and car supply adequate. Anthracite dull on tidewater business but active all-rail; stove coal in short supply.

Bituminous—The soft coal market remains quiet, with the demand light but prices moderately steady. There appears to be a fairly good supply of coal at tidewater, although by no means an abnormal amount. An encouraging feature of the situation is that consumers continue taking heavy tonnages on their contracts, in most instances up to the maximum specified; it is also noted that there are a few inquiries for new contracts in spite of the fact that this is not the customary season for placing these. The figures quoted in this new business are 15@20c. above last year's prices.

The car supply in the mining region shows a steady improvement. The situation on the B. & O., which was bordering on the acute a few weeks ago, is now comparatively easy, though still spotty and rather uncertain. No restriction in mining is reported, operations continuing at full rated capacity and limited only by the indifference of the men to work and occasional delays due to the car supply. Mines are comparatively full handed, although most operations report that they could use a few more. Prices continue rather weak, as follows:

West Virginia steam, $2.65@2.75; fair grades of Pennsylvania, $2.75@2.85; good grades of Pennsylvania, $2,85@2.95; best Miller Pennsylvania, $3.15@3.25; George's Creek, $3.20@3.30.

Anthracite—The hard-coal market was exceptionally dull on tidewater shipments although all-rail business to Eastern points continued active. Straight stove for all-rail delivery brought premiums of fifty cents through the individuals and some sales for tidewater delivery were made on the same basis.

The companies were all exceptionally short of both stove and nut, which allowed most of the individual shippers to dispose of egg provided stove and nut accompanied the shipments. Many of the local dealers complained of dull business, due undoubtedly to the unseasonable weather prevailing, but if real cold weather occurred there is no question but that a famine in stove and nut sizes would prevail. The companies have no stock on hand in the domestic sizes except egg, and for that reason the daily production on stove and nut would necessarily have to take care of the demand and as this increases, the situation on these sizes will become more acute. The suspension of Lake shipments may help to relieve the situation, but on the other hand the demand on all-rail shipments to other points will probably prevent any noticeable change in the local situation. Considering the small supplies held by the large companies at this time of the year, and the possibility of a severe winter before us, it is the opinion among the conservative element that premium prices will prevail on individual coals before the year is out.

Steam sizes except pea were long on the poorer grades and even high-grade coals found difficulty in prompt disposition. The opinion is expressed by many in the trade that although premiums may be obtained later, on the popular sizes in the domestic coals, there will be no difficulty for consumers to obtain their supplies of the steam cofas at normal prices with a possible exception in the higher grades, which usually are short during a severe winter. However, the contemplated trouble in the bituminous fields this coming year may have a tendency to bring better prices and an unusual demand for all grades of steam sizes, but there is no likelihood of this being felt until February or March.

The local market is now quotable as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular*	Individual
Broken	$5.00	....	$4.95	
Egg	5.25	$5.10@5.25	5.20	$5.00@5.20
Stove	5.25	5.25@5.75	5.20	5.20@5.70
Chestnut	5.50	5.50	5.45	5.45
Pea	3.50	3.50	3.45	3.50
Buckwheat	2.75	2.60@2.75	2.45@2.70	2.15@2.70
Rice	2.25	2.15@2.25	1.95@2.20	1.70@2.20
Barley	1.75	1.60@1.75	1.70	1.40@1.[illegible]0

*An addition of 2½% is required on the prepared sizes in this column to cover the new Pennsylvania state tax.

BALTIMORE, MD.

The soft-coal market remained about stationary, but on a rather poor basis. Slack was a little farther off, and coke was selling very cheap. Little demand for anthracite above immediate needs.

There was little change in soft coal conditions here the past week. The market on the whole remains unsatisfactory, demand being light and prices considerably off what they should be for the season. Efforts on the part of West Virginia producers to get rid of slack in the face of the lessening demand for that fuel, caused it to go off a little more. Sales as low as 85c. were recorded.

As a whole the gas-coal market in West Virginia stood about as last week. Run-of-mine was selling around 95c., and three-quarter anywhere from $1@1.10. Pennsylvania steam fuels sold at various prices from $1.05@1.15, although the market was dull at those figures.

Coke now stands about the worst figure of the market. The lessened demand of the steel industry, as typified here by the closing of the rail mill of the Maryland Steel Co., during the past week, has hit the coke trade hard. First-grade Connellsville cokes were being offered freely at from $1.75@1.80. West Virginia cokes were often going begging at $1.60.

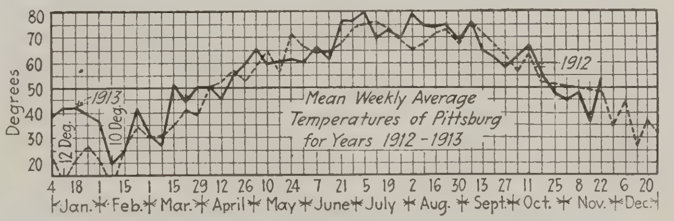
Waterfront business here is not as good as could be desired. A drop off in the number of tramp steamers calling at the port recently has caused a decrease in bunker demand.

CENTRAL STATES

PITTSBURGH, PENN.

Demand reduced. Car supply suddenly becomes plentiful, and prices being cut below the list of October, sometimes to the earlier basis. Lake shipments smaller than expected for November. Connellsville coke soft, with prices quotable 10c. lower.

Bituminous—The market has softened very considerably in the past week, owing to a variety of causes. In the first place, a softening tendency at this season was to be expected, and would in normal circumstances be spread over a period of several weeks. This year, however, a very severe storm occurred, Nov. 9, tying up the railroads quite largely and causing a temporary shortage of coal, which stiffened the market or at least arrested the softening tendency, while now the accumulated effect of the progress of the season is suddenly exerted. Lake shipments have been reduced on account of the storm on the lakes, of unprecedented severity, vessels being lost and the movement of surviving vessels much interfered with, so that the total of lake moved this month is proving much less than expected. Cars, however, have suddenly become quite plentiful, and there is scarcely any curtailment of operation on account of inability to get cars. Iron and steel mill operations have been decreasing rapidly and industrial activity generally has undergone some decrease. All these influences have been felt in the coal market, and prices have naturally suffered. Instead of premiums being secured on prompt coal over the advanced prices put out at the beginning of October there has been a disposition to shade those prices, and in some instances sales have been made at the old season price, based on $1.30 for mine-run. Operations at mines are slightly less than they were three weeks ago, although with the supply of cars and men they could easily be much greater. Demand is now regulating mine operations, instead of the limited supply dictating the price. We quote: Mine-run, $1.30@1.40; ¾-in., $1.40@1.50; 1¼-in., $1.55@1.65; slack, 90c.@$1. per ton at mine, Pittsburgh district.



Connellsville Coke—The market has lost more ground, the temporary stringency in supplies caused by the storm being entirely relieved last week. Coke is in plentiful supply on contracts, and free coke is being offered around, finding hardly any takers. While the majority of operators still adhere to the policy of holding off as to contracts for 1914 and awaiting the initiative of buyers, a few operators have been actively soliciting furnaces to take hold, and have probably named very attractive prices, well under $2, which seems to be the price ordinarily mentioned in the market as likely to be quoted by sellers in opening negotiations for 1914 furnace coke. Foundry coke has softened in consonance with furnace coke, and thus the whole market can be quoted down about 10c. for the week. We quote: Prompt furnace, $1.75@1.85; contract furnace (nominal), $2; prompt foundry, $2.50@2.75; contract foundry, $2.50@2.75, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Nov. 15, at 336,162 tons, a decrease of 17,883 tons, and shipments at 333,609 tons, a decrease of 33,870 tons.

BUFFALO, N. Y.

Coal business slow due to the warm weather. Bituminous dealers holding firm, but demand light. Anthracite selling fairly well and independents confident of future.

Bituminous—There is little improvement to be expected in the trade so long as the weather continues warm and cars are plentiful. The consumer is trying to control prices and it is a hard matter to hold the market even in the weak condition that has prevailed for a month or so. Still there are no important breaks reported.

There is a steady increase of labor difficulty in all the mining regions. There is no real difficulty in the mines except that the men are uneasy and are seizing on most anything as an excuse to make trouble. In some instances they are demanding more pay.

The market is still dependent on the weather. Dealers are of the opinion that they can hold it where it is, unless the warm weather should continue away into December. Anyhow, after that the time is not far off when consumers will have to store coal. At present they are laughing at dealers who refer to present labor troubles; it is the old dodge, as they look at it. Quotations remain very weak at $2.90 for Pittsburgh lump, $2.80 for three-quarter, $2.65 for mine-run and $2.25 for slack, with slack quite as weak as sizes, on account of the approach of the close of the lake season. Allegheny Valley coal is quoted at from 15 to 25c. lower than Pittsburgh.

Coke—There is no life to the coke market. Consumers still hold that it is too high and it may be well if they can crowd the prices down till steel can be reduced to prices at which it can be sold more freely. Coke sells on a basis of $4.65 for 72-hour Connellsville foundry.

Anthracite—There is no snap to the anthracite trade, because of the warm weather. As a rule the sellers of independent coal are making the most confident reports. Trade is good with them in all of the smaller sizes. Egg is dull everywhere. The charging of the Pennsylvania state tax is often rebated out of that state, even where the seller has adopted the increase.

TORONTO, CANADA

Normal supplies except on some grades of anthracite, which are short. Market quiet but steady.

Business in the local market has been more quiet than is normally the case during this period of the year, due principally to the rather mild weather. Supplies on hand appear to be about normal with the exception of some grades of anthracite, stove coal for instance, which is behind. The retail market is quotable about as follows:

Anthracite, $8; bituminous (steam), $5.25; bituminous screenings, $4.35; domestic lump, $6; cannel coal, $7.50.

In the wholesale market three-quarter lump is quoted at $3.85 f.o.b. cars, and screenings at $3.

TOLEDO, OHIO

Heavy lake shipments. Warm weather having a bad effect on prices although they have been fairly well maintained as yet.

The weather here has been warm and balmy, which has naturally had a deadening effect on the coal market. Domestic demand has been light although steam coal continues active. Lake shippers are working hard in an effort to get as much coal going up the lakes prior to the closing of navigation, which will take place the first of the month, as possible. Coal and ore vessels suffered extremely during the recent storm and railroads were somewhat tied up so that shipments were more or less delayed.

Dealers here are fearful that prices may not be maintained should the weather remain warm, although at present there is no indication of a break in the market. Prices have been holding fairly close to the list. The car situation has improved somewhat and better working conditions are looked for. Prices as quoted here are as follows:

	Pocahontas	Hocking	Jackson	Pomeroy	Massillon	Pitts. No. 8	Cambridge
Domestic lump	$2.50	$2.00	$2.75	$2.25	$2.50	$1.50	$1.40
Egg	2.50	1.35	2.75	1.50	2.50	....	....
Nut	2.00	0.80	2.25	1.75	2.50	1.35	....
⅞ lump	....	0.90	....	....	....	1.30	1.20
Mine-run	1.60	1.50	....	....	....	1.20	1.20
Slack	....	0.70	....	....	....	0.80	....

COLUMBUS, OHIO

Some softness developed because of the warm weather. Prices did not suffer on the whole but in some instances lower quotations were given. Domestic lines only ones affected; other departments held up strong.

The coal trade in Ohio during the past week was rather flat because of the higher temperatures. As a result some of the dealers cancelled their orders placed during the recent cold spell. But a large portion of the retailers failed to cancel believing that the coal ordered would come in handy later on. Retail stocks are not heavy in any section and many of the dealers are trying to accumulate.

Prices did not suffer to any great extent. In most instances the circular figures were well maintained and discounts were few and far between. With the exception of domestic grades, prices were about as strong as earlier in the season.

The lake trade is still active and will continue so until the close of navigation. Some vessels will be put in port for the winter about Dec. 1, while others will make the last trip to the Northwest after that date. The demand for fuel there is still strong and practically no congestion at the docks is reported. Dockmen are making every effort to get a large tonnage to the upper lake ports to avoid a large all-rail movement later.

Steam demand is good in every way and manufacturing establishments are taking about their average amount. Railroads are also fair customers for steam grades as their freight movement is good. Some disposition is shown by some of the larger users of steam grades to accumulate stocks for a protection against a car shortage.

Some slight improvement in the car supply is reported from certain mining districts of the state but this is due more to the better weather which permits a freer movement of coal trains than to any other factor. Operations which depend upon the car supply have been about 55 per cent. in the Hocking Valley and Pomeroy bend and about 50 per cent. of the average in eastern Ohio. Other districts have also been hampered by the car shortage.

Retail trade is as active as could be expected under the circumstances. Retailers prices have not weakened under the influence of milder weather.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$2.00 @ 1.90	....	$2.25 @ 2.15	$2.00 @ 1.90
3-4 inch	1.85 @ 1.75	$1.50 @ 1.40	2.00 @ 1.90	1.85 @ 1.75
Nut	1.30 @ 1.20	....	1.75 @ 1.65	1.40 @ 1.35
Mine-run	1.50 @ 1.40	1.25 @ 1.20	1.50 @ 1.40	1.50 @ 1.45
Nut, pea and slack	0.95 @ 0.90	....	1.00 @ 0.90	0.90 @ 0.85
Coarse slack	0.85 @ 0.80	1.00 @ 0.95	0.90 @ 0.80	0.80 @ 0.75

DETROIT, MICH.

Car supply causing some anxiety. Contracts for new period will be at higher figures. Anthracite easy and coke soft.

Bituminous—Coal is being moved away from the local yards quite as fast as it comes in, so that there are few or no accumulations and the spot market is firm. The car supply is also the source of some anxiety, producers expressing the fear that it may become so inadequate as to make it impossible to ship full tonnages on contracts. Operators claim that contracts expiring after the first of the year will command a premium of 25c. on the old business when renewed. The cold snap locally has materially stimulated business, and prices are strong and inclined to advance.

Anthracite—Hard coal is in good supply, even the stove size which has been so short.

Coke—Coke is weak, Connellsville foundry being quoted down to $1.95, with Semet Solvay $3 and gas house $2.75.

HAMPTON ROADS, VA.

Shortage with the larger shippers still continues. Dumpings for week heavy. Prices remain firm.

The movement from Hampton Roads during the week has been heavy. This is particularly true as regards the movement from Sewalls Point piers. The Virginian Ry. up to date appears to be running close to the dumpings of the Norfolk and Western Ry. It is hardly probable that the dumpings of the Virginian Ry. will run over those of the Norfolk & Western for the month but it is safe to say that their figures will be close. Some of the largest shippers still continue short of coal and are having considerable difficulty to get coal in the open market to take care of contracted tonnage. Prices on New River and Pocahontas are about the same as they have been for the past two or three weeks. This is also true as regards the high volatile coals.

The Norfolk & Western during the last week made their record for fast loading when they loaded the s.s. "Suffolk" at their pier No. 3. A cargo of 7508 tons was loaded in seven hours which is remarkably fast time considering the old style facilities now in use at Lamberts Point. Cargoes moving foreign from Hampton Roads during the week went to: Coronel, Havana, Genoa, Port of Spain and Canal Zone.

LOUISVILLE, KY.

Business light with dealers due mild weather. Stocks accumulating.. Steam coals in better demand.

In spite of the fact that winter is near, the coal market is as yet strictly a weather proposition. Warm and pleasant weather for the greater part of the week just past has resulted in a poor demand for domestic coal, the price going off in consequence an average of ten cents a ton on all sizes and grades. Dealers have had little chance to move the stocks stored earlier in the season, and are therefore placing no orders for immediate delivery.

While the same cause has produced a little of the same effect in the steam market, the demand for screenings has by no means gone off as much as that for domestic coal. A pronounced car shortage in Eastern Kentucky several days of last week indicates what may happen when the demand for coal is again normal.

Prices for the better grades range from $2.25 for block to 55 to $1.75 for round, f.o.b. mines. Eastern Kentucky nut l slack is selling for 80 and 85c., and Western Kentucky 70 to 75c. The slow domestic movement is largely reonsible for the fact that steam prices are holding up as ll as they are, as the supply of screenings is not overge, and the demand, as indicated, is hardly normal.

SOUTHERN AND MIDDLEWESTERN

NEW ORLEANS

Increased demand in Latin America and at points along e Southern Pacific Railway stimulates activity in coal cires. Cargo shipments fall off. Guatamala Central ready to y coal.

A more active demand developed in this market last week. is was due to a greater demand for parcel shipments to tin American points, call for coal trimmed into bunkers in e harbor and additional orders from western Louisiana and xas points following the settlement of the Southern Pafic strike.

There was an absence of cargo movement from Mobile or nsacola last week but coal is being assembled for loading veral cargoes next week. The Central Railway of Guateala is expected to place its order at once. Demand from exican points has increased owing to the cutting off of the al mines in the northern part of that republic. The busiess in sight is to move to Vera Cruz and Mexico City. Seval orders are pending calling for routing via Tampico but wing to the unsettled conditions existent shipment is being eferred.

With the bulk of the cotton crop being handled there is rtain to be considerable consumption from ships. Addional facilities for the handling of coal in the harbor are beg made which will doubtless add to the number of ships aling at this port.

INDIANAPOLIS, IND.

Domestic movement satisfactory in all branches. Local arket shows little change. Full demand on contracts. creenings weak, but trade generally firm.

Notwithstanding almost summer-like conditions, there is ttle complaint in local trade circles, either from buyers or ellers. Domestic coal appears to be a little more satisfactry, and the steam business is also up to normal in spite of dverse sentiments regarding general business. The factories ppear to be taking full tonnages on their contracts, and ne large producer reports being six weeks behind orders. lines as a rule are running full time unless delayed by lack f railroad cars; the Big Four R.R. has been the worst offender in this respect but indications are that it will materially improve its service shortly. The public Utilities Comnission has entered a complaint to the effect that terminal acilities at Indianapolis are inadequate and will have to be nlarged.

The market on screenings is more unsettled than in any ther branch; an urgent order may command 70c., but prices ange from there down to 40c., depending some on quality, ut, principally, upon demand. Domestic coals have not sufered as yet, because of the mild weather, except, possibly, or a slowing up in some of the small retail business. Mineun No. 4 is quoted at $1.10@1.25, with sales usually closer o the lower figure; No. 4 domestic lump commands $1.90, .o.b. mines.

Retail prices have remained unchanged since Sept. 20. The opinion is that they will continue steady to firm alhough it is noted that Indiana lump is being offered at $3.50 n one instance, the circular being $3.75. The continued warm weather through November is causing a note of anxiety n the trade.

CHICAGO

Continuation of warm weather has created a soft market. Steam prices have been cut 5 to 10c. a ton. Springfield mines have reduced output on account of slack business. Smokeless coal continues strong. Prices for anthracite remain stationary with the volume of business light. Coke market is unsteady.

Indian summer weather has had a softening influence on the market. There has been a drop in prices for steam coal and a cut in quotations for domestic has been threatened for several days. Retail dealers announce that there has been a light demand and this condition has had the effect of weakening the steam trade. Many operators who lacked orders from the domestic market have sought to dispose of their output through steam trade channels with the result that considerable strength has been taken away from the latter branch of the trade. Prices for steam lump mine-run and screenings have been trimmed between 5 and 10c. a ton.

Variable prices are being asked for Franklin County coal. Some sales at $2.25, the mines, have been recorded, but the bulk of the business has been handled on the basis of $2. Sales have been reported in a few quarters at $1.90. Springfield operators are getting $1.50 for domestic lump coal in Chicago and $1.65 to $1.75 in the country. A majority of the Springfield mines are running only two or three days a week on domestic sizes on account of slack business.

Demand for splint coal has lessened to some extent. All-rail coal is still sold in competition with the dock coal as retail dealers realize that the dock supply will not be sufficient this year.

Smokeless coal retains a strong position. Mine-run is selling at $1.40 to $1.50 on shipment direct from the mine. Lump and egg commands $2.25 to $2.50, the mines. Very few shipments of Hocking Valley are being received and for this reason orders are being accepted with the proviso that delivery will not be guaranteed. The circular price of $2.20, the mines, remains firm. There has been a let-up in the buying of anthracite by retail dealers and sales are made with a good deal of difficulty. Prices, however, remain about the same. Carterville operators are obtaining $2 for domestic lump and No. 1 washed coal. Raw screenings are being disposed of in this market on a parity with central Illinois fine coal. Indiana domestic lump is being sold around $1.75 and spot sales on screenings are being made at 30c. a ton. The coke market is unsteady, although no cuts in prices have been made.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.32	$3.05@3.30	$2.52	
Steam lump	2.02		2.07	
Egg		3.05@3.30		$4.30@4.45
Mine-run	1.87	2.40@2.55	1.87	3.45@3.55
Screenings	1.12	1.55	1.27	

Quotations on Harrisburg coal are: Domestic lump and egg, $3.05; steam lump, $2.65@2.80; mine-run, $2.40@2.55; screenings, $1.55; No. 1 nut, $3.05; No. 2 nut, $2.80. Carterville prices are: Lump, egg and No. 1 washed, $3.05; No. 2 washed, $2.80.

Coke—Connellsville, $5.50; Wise County, $5.25@5.50; byprodust, egg, stove and nut, $4.90@5; gas house, $4.90@5.

ST. LOUIS, MO.

Weather conditions unfavorable for good prices, and coal is sold at less than cost of production. Prospects not good for future. Poor market on all fuels.

The weather has been against the coalman during the past week, and if there is another week of spring weather there will be absolutely no coal market. Both domestic and steam business went to pieces and it will take two to three weeks of good winter weather to get it back to where it was before the warm wave.

Standard screenings are down to 10 and 15c. This constitutes 40% of the coal mined. The other 60%, consisting of 2-in. lump, is being sold at from $1 to $1.10. Figuring that it would bring an average of $1.05, this makes 67c. per ton for mine-run. The very lowest cost of production in the Standard field that can be figured in any way is 78 cents.

The anthracite, smokeless and coke markets are pretty well demoralized as there is no buying of any kind. It has even effected the country, and very few orders are coming in.

The prevailing prices are:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$1.05@1.15
3-in. lump	....	....	$1.50	....
6-in. lump	$1.75 @ 1.90	....	1.60	1.25@1.35
Lump and egg	1.85 @ 2.15	Over sold	....	....
No. 1 nut	1.40 @ 1.50	....	....	....
Screenings	0.40 @ 0.50	....	....	0.10@0.20
Mine-run	1.10 @ 1.20	....	....	....
No. 1 washed nut	1.75 @ 1.85	....	1.40	....
No. 2 washed nut	1.40 @ 1.50	....	1.60	....
No. 3 washed nut	1.15 @ 1.25	....	....	....
No. 4 washed nut	1.00 @ 1.10	....	....	....
No. 5 washed nut	0.45 @ 0.55	....	....	....

KANSAS CITY, MO.

Operations will have to be restricted shortly unless there is a change in the weather. Market steady but showing indications of weakening.

Unseasonable weather has held down the demand for coal in the Missouri and Kansas fields, and several mines have been forced to close down, pending the return of cold weather. Recent conditions have been unfavorable, and while yearly contracts held by several of the operating companies have tended to relieve the situation, others have not been so fortunate. The majority of the mines are being worked, but will be forced to cease full-time operations shortly. The market has been steady, despite the poor trade, but is expected to weaken in the immediate future unless a change in the weather takes place. The car shortage is hardly noticeable, because of the decrease in movement of coal.

PORTLAND, ORE.

Market quiet. Shipment of foreign coal the only feature of interest.

The general condition of the coal market here has shown no change during the past week. A shipment of 900 tons of coal that arrived here from Australia on the British ship "Segura" was purchased by the Pacific Coast Coal Co. Two car loads of coal from the new Monarch mine near Centralia, Wash., were received here last week as samples. Some of the product of the mine will probably be marketed here this winter.

PRODUCTION AND TRANSPORTATION STATISTICS

NORFOLK & WESTERN R.R.

The following is a statement of tonnages shipped over this road from mines in West Virginia and the commercial and company coal, for the month of October, in short tons:

Field	Shipped	Tipple	Total	Commercial	Company
Pocahontas	1,225,803	18,681	1,244,484	1,267,615	92,431
Tug River	221,464	3,879	225,343	184,353	40,990
Thacker	247,746	9,055	256,801	167,732	89,069
Kenova	77,163	9,083	86,246	70,670	15,576

Domestic	1,542,069	1,677,545	14,787,932	15,483,089
Coke				
Tidewater, foreign	....	3,292	52,762	30,491
Domestic	131,007	111,020	1,145,181	1,264,781
Total	2,070,779	2,209,261	20,246,807	21,325,120

FOREIGN MARKETS

GREAT BRITAIN

Nov. 14—Steam coal market conditions remain very firm for all descriptions of large. With considerable tonnage in dock and outputs limited, few sellers are in a position to accept prompt orders. Buyers are hoping that after completion of the British Admiralty's requirements, easier conditions may be in evidence. Tonnage is being delayed by stormy weather, but there are sufficient ready steamers to take all the coal available for prompt loading. Quotations are approximately as follows:

Best Welsh steam	$4.86@4.98	Best Monmouthshires	$4.14@4.20
Best seconds	4.68@4.80	Seconds	3.90@4.02
Seconds	4.50@4.62	Best Cardiff smalls	2.58@2.64
Best dry coals	4.44@4.68	Seconds	2.34@2.46

The prices for Cardiff coal are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, evclusive of wharfage, and for cash in 30 days.

Newcastle-on-Tyne (England)—The counties of Northumberland and Durham are large producers, and the output of their collieries is one of the main reliances of ships trading with the North Sea ports. Necessarily the coal strike seriously affected this neighborhood, but shipment of coal in 1912 fell less than one-tenth below the total of 1911, while it was larger than many previous years. The total shipments, foreign and coastwise, aggregated 18,681,372 tons, as compared with 20,543,683 tons in 1911, a decrease of 1,862,311 tons. A more serious effect of the strike, however, was a rise in the price of coal, which will probably be permanent owing to increased wages and shorter working hours graned to miners.

Hull ,England)—In spite of the stoppage of exports due to the miners' strike and consequent derangementc, shipments of coal abroad from Hull showed considerable increase over those of 1911. It should be remembered, however, that strike troubles in that year were responsible for considerable falling off in business.

There were exported from Hull 3,684,176 tons of coal in 1912, in comparison with 3,355,415 tons in 1911; and that shipped to coastwise ports amounted to 973,877 tons in 1912, as against 982,096 tons in 1911; coke exports were 51,091 tons in 1912, in comparison with 37,129 tons in 1911. These figures represent about one-half the coal and coke traffic on the Humber River, including the ports of Grimsby, Goole, and Immingham, which shipped coal and coke during 1912 to the amount of 9,155,937 tons, as compared with 8,758,134 tons in 1911.

Nova Scotia—From the four Nova Scotia coal fields—Sydney, Inverness, Pictou and Cumberland—nearly 7,000,000 tons of coal were mined in 1912. Approximately half of this amount was sold in the Maritime Provinces, the balance going to Quebec ports and a considerable tonnage being shipped to the United States.

Prince Edward Island (Canada)—The island's coal imports, are carried in wooden schooners, and come from Cape Breton and Nova Scotia collieries; they are increasing each year at the rate of about 8 per cent. In 1912 there were imported 70,030 tons of bituminous coal in this way; 10,562 tons of anthracite coal were also brought from New Jersey and Chesapeake ports in American schooners. Both coal and lumber are rising steadily in price.

COAL SECURITIES

The following table gives the range of various active coal securities and dividends announced during the week ending Nov. 22:

Stocks	Week's Range High	Week's Range Low	Week's Range Last	Year's Range High	Year's Range Low
American Coal Products	..	..	80	87	80
American Coal Products Pref.	..	..	105	109¼	102

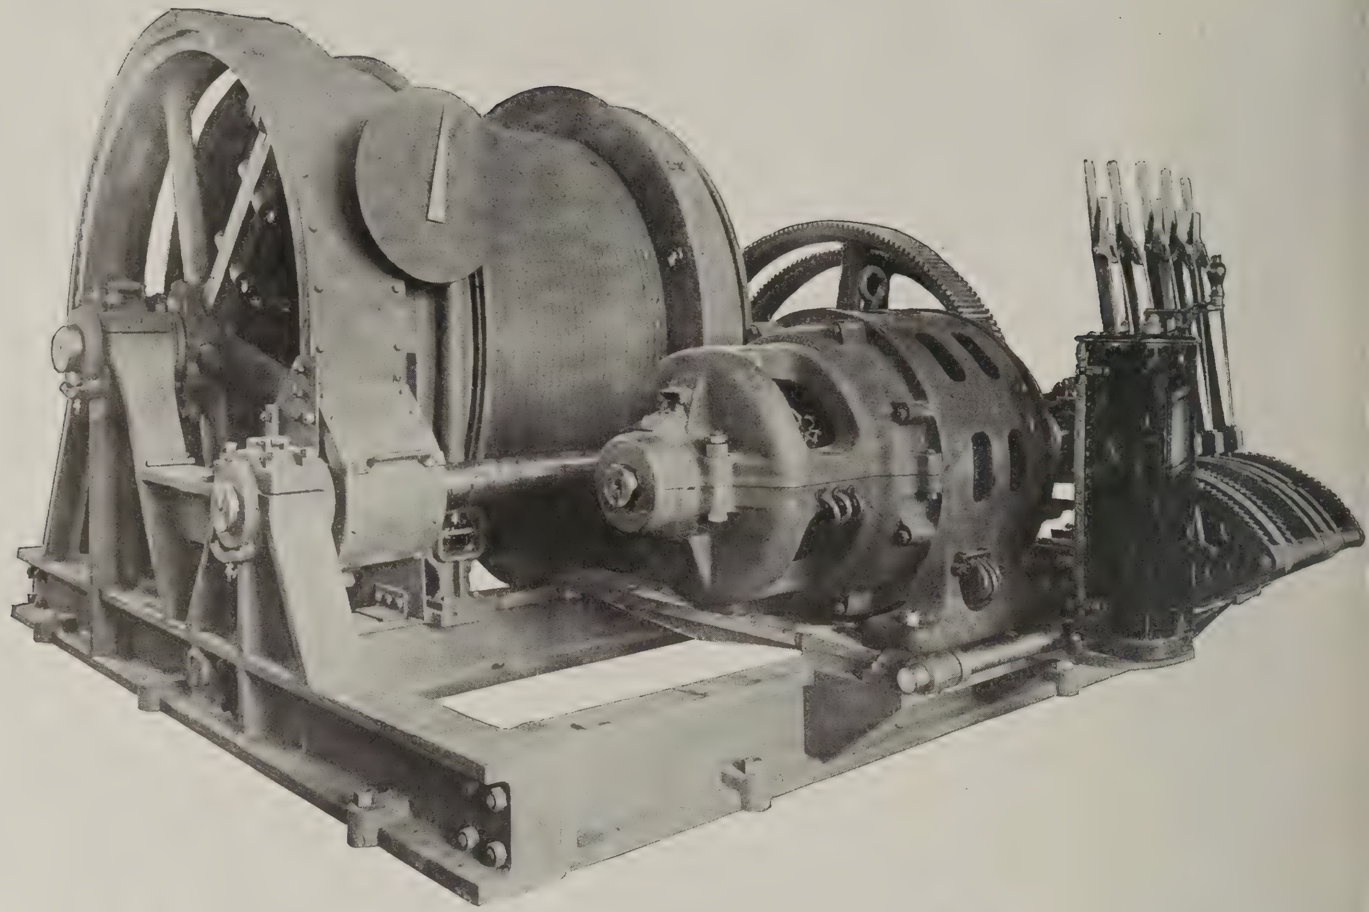
Face of Entry in Mine of Rosedale Coal and Clay Products Co., Calgary, Alta.



Westinghouse Motors For Moderate Sized Hoists

While manufacturing the electrical apparatus for the largest mine hoist installation ever undertaken in the United States, the Westinghouse Electric and Manufacturing Company has devoted very careful attention to the design of motors for moderate sized hoists.

No attempt is made to take motors designed for some other purpose and adapt them to mine conditions. **They are hoist motors and are especially designed in every respect for this service.**

These motors have unusually heavy pulling power for their horsepower rating. The revolving part is small in diameter to permit quick stops and reversals. Low power consumption insures economical operation.

They are particularly designed to allow ease of inspection and dismantling, if necessary. All coils are form wound and placed in open slots, making repairs, in case of accident, as simple as possible.

Our nearest office will be pleased to furnish full information about Westinghouse Mine Hoist Motors upon request.

VOLUME 4 DECEMBER 13, 1913 NUMBER 24

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 885

Refers to the need of encouraging the Christmas spirit in coal-mining camps, and expresses the belief that the distribution of plum pudding and good cheer will not be forgotten when the present generation of children reach man's estate.

EFFICIENCY IN COAL MINING: *Pages* 886-888

Address before the Coal Mining Institute of America. Simple and explicit rules and suggestions are given for the buying, the equipment and the operation of coal mines. Harrington Emerson. COAL AGE, Vol. 4.

INDUSTRIAL SAFETY: *Pages* 888-889

Some of the developments in the industrial-safety movement are here enumerated. Figures are also given, showing the decrease in coal-mining accidents during recent years.

*REMOVING STEEL TIRES FROM MINE MOTOR WHEELS: *Page* 889

SELECTION OF COKE FOR ANALYSIS: *Pages* 890-891

Much of the phosphorus trouble that occurs in the manufacture of coke can be avoided if proper methods of sampling are followed. Several instances are cited from practical experience. Fred C. Keighley. COAL AGE, Vol. 4.

*A PORTABLE SHEAVE FOR A GRAVITY PLANE: *Pages* 891-892

COAL AND THE PANAMA CANAL: *Page* 892

BUREAU OF MINES APPROPRIATIONS: *Page* 892

SOME NOTES ON THE SELLING PRICE OF COAL: *Pages* 893-894

A discussion of this important question along original lines. The author points out the low earnings realized in the coal business and states that steps must be taken to obtain a better profit. A closer coöperation between the operating and selling departments is essential; also a more careful study of costs. R. A. Colter. COAL AGE, Vol. 4.

MAUNFACTURE AND CHARACTER OF BASIC COKE: *Pages* 894-896

Basic coke cannot be made in beehive ovens as the temperature is insufficient. It can be manufactured in byproduct ovens, but only one-third of the original sulphur is converted into calcium sulphide. However, by the addition of lime to coal in the oven to make basic coke some of the volatile sulphur is retained in the fuel which would otherwise be expelled. J. R. Campbell. COAL AGE, Vol. 4.

STUDY COURSE IN COAL MINING: *Page* 913

EXAMINATION QUESTIONS WITH ANSWERS: *Page* 914

A NEW COAL RAILROAD: *Page* 897

A LARGE MODERN BREAKER: *Pages* 897-898

VIGILANCE AND CO-OPERATION AS FACTORS OF SAFETY: *Pages* 898-899

W. E. Holland. COAL AGE, Vol. 4.

MICHIGAN MINING INTERESTS IN SPITZENBERGEN: *Page* 899

MEETING OF COAL MINING INSTITUTE OF AMERICA: *Pages* 900-901

The winter session of the Institute was the most successful in its history, and the papers were all of unusual interest. The principal discussions were on the effect of adding foreign bodies to coal before coking, on profits of efficiency and their distribution, and on Rule 18 of the Pennsylvania State mine law. COAL AGE, Vol. 4.

SNAPSHOTS IN COAL MINING: *Pages* 902-903

Miscellaneous views of surface and underground equipment gathered from all parts of the world.

THE NECESSITY OF ORGANIZATION: *Pages* 904-905

Mine labor is about as efficient today as it was several years ago. By organization the miner has given stability to the industry. Disputes between operators and labor unions could be advantageously and peaceably settled, and the operators otherwise greatly benefited, if they were as strongly and thoroughly bound together as are the miners. Thomas L. Lewis. COAL AGE, Vol. 4.

World Competition

The Weekly Ad-Talk Page

In the December issue of "Everybody's Magazine" there is a dynamic article by William Hard, called "Better Business."

It startles us first, by telling us that pig iron is being brought into the United States from China, India, Cuba and Chile at a price that puts it into active competition with American pig iron. This, with a material which is heavy, costly to move, is indicative of the new order of things in which the United States under the new tariff law will enter into a period of World Competition.

World Competition will mean that no longer under the protection of a high tariff, this country will have to compete with other countries on a basis of efficiency—nothing else.

To quote Mr. Hard: "Better Business in this country will now more than ever rest on Better Engineering. . . . A new technical triumph in managing Lake Superior ore would carry it a few miles farther east. A new technical triumph in handling Cuban ore would carry it a few miles farther west."

Thus he illustrates how important it is to cut down production cost to bed rock and at the same time raise quality as high as possible. And that this can only be done by technical knowledge, research and the equipment that results from these.

Presently Mr. Hard says: "The hour strikes for a pious act of self-examination: *For a national technical task, what is our national technical equipment?*"

He goes on to claim—and he proves his point!—that while we have been content to sit close with our prosperity, self-satisfied and complacent, other nations have forged ahead. The three most important engineering discoveries of the last twenty-five years—the gas engine, the dynamo, the steam turbine—all had their origin in Europe.

But if we have not originated, how quickly have we adapted and adopted? Again we are proved laggards.

Focusing his argument on the iron-and-steel industry (surely a representative American industry!), Mr. Hard tells us that the first installation of blast-furnace gas engines in the United States was made seven years after the first installation in both Germany and Belgium. The first installation of a turbo-compressor in a blast furnace followed the first installation in France by six years.

In the old days of the high-wall tariff this non-progressiveness may not have mattered so intensely but in the new era of World Competition it does matter—vitally!

We will need, as Mr. Hard says, all the Better Engineering we can get, all the help that technical knowledge and skill and experience can give us. To stay in the race we must have the most modern equipment, the most time-saving productive devices and machines that can be furnished us.

Where can the progressive engineer put his hand on this modern equipment? Where can he find out about it? Where can he find it guaranteed to be reliable and efficient?

In the advertising pages of his technical publication. These pages automatically confine themselves to only what is latest and best. So searching is the investigation of a product, nowadays, so keen the competition, that only efficient machinery can be profitably advertised.

In the new era of World Competition, the advertising pages of such a paper as *Coal Age* stand ready to help you.

COAL AGE

No. 4 NEW YORK, DECEMBER 13, 1913 Vol. 24

"It's a pudding will put a man in good humor with everything, except the two bottom buttons of his waistcoat," wrote Charles Dickens, in one of his Christmas stories, a half century ago.

A pudding, good humor and a full stomach! surely that's Christmas!

Dickens undoubtedly stands supreme, when it comes to making us *feel* Christmas. Other writers may tell us about "Peace on Earth, Good Will toward Men," but he gives us the actual sensation of Yuletide. We have just reread his "Christmas Carol," and when we finished that last line—"And so, as Tiny Tim observed, God bless Us, Every One;" we closed the book, realizing, as we had never realized before, the power and the goodness of his genius.

And now this thought comes to us. Suppose that every child in every mining camp in America could have that story read to him on Christmas Eve, while the spirit of the occasion is everywhere. Wouldn't the effect on the next generation of miners be beneficial?

Of course, to accomplish this, some of us would have to make sacrifices; many would have to forego Christmas family reunions planned in distant cities, others would have to create funds to buy books, or be willing to participate in public readings, and, mind you, the money required for the books would be but a drop in the bucket, for once the Christmas spirit gets loose in the land, Turkey and Plum Puddings in great plenty would have to be forthcoming from somewhere.

We doubt if any fellow who postponed the family reunion would have cause for regret. On Christmas, our mining camps need all of those inhabitants who have sentiment enough to enjoy family reunions, and if only enough of such men would realize that their mining camp could be a big family circle, the reputation of such communities might touch par.

The town, the village or the city that furnishes its children with Plum Pudding and Christmas Cheer will not be forgotten, when those children are grown to man's estate and are planning homes for their own descendants. In fact, Plum Pudding and Good Cheer might be distributed to good advantage by even the most selfish; such generosity in the end would only be "good business."

Now we have had our say, but we couldn't close with the words "good business." We prefer to turn back to Dickens: "And so, as Tiny Tim observed, God bless Us, Every One."

Efficiency in Coal Mining

By Harrington Emerson*

SYNOPSIS—Address before the Coal-Mining Institute of America. Simple and explicit rules and suggestions are given for the buying, the equipment and the operation of coal mines.

⁂

Mathematics is a science. Different businesses use it in different ways. Chemistry is a science. Different businesses use it in different ways. Hygiene is a science. Different people use it in different ways. Efficiency is a science. It is the science of realizing standards. Different businesses have different standards and different men have different standards for the same business.

We cannot talk of efficiency in coal mining without first setting up standards. As the special cases are usually more interesting than abstract reasonings, I shall give the standards that we established for a particular coal mine in a particular locality. I do not claim that these standards would have applied to any other mine.

Capital Invested

As to capital there are four general rules, one or the other or all of which are frequently violated:

(1) Know what all the facts are. Do not delude yourself with fancies or guesses.

(2) Do not pay more for any property or improvement than you can get back out of it, including 6 per cent. interest, in 8 to 10 years. Do not pay more than $1000 for a property that will not yield a net profit of $150 to $200 a year.

(3) Do not spend $1000 for an income of $200 until you are sure you have no opportunity to spend $200 or less to save $1000.

(4) Do not allow your capital to shrink. Carry as an operating expense any diminution.

Coal properties as to capital investment come in the same catagory as real estate; unless the property is made productive the interest and taxes accumulate faster than any possible increase in value. A lot in New York at the corner of Broadway and Wall St. sold about ten years ago for $1,000,000. Even at this price it would not have been a profitable investment in 1800 at $1000, unless it had brought in current revenue. The great land grants to the railroads would have swamped them if for the first 20 years taxes had been levied at $0.10 an acre a year. The taxes would have amounted to $5,000,000 yearly for the Northern Pacific alone.

Coal and lumber properties have to be worked. The revenues must come from the coal mined and the trees felled. It is an extremely ticklish business in real estate, in coal lands, in timber tracts to put the dead certainty of taxes and interest against the guessed-at rise in value.

Therefore, in considering timber tracts and coal fields, always insist on a separation of land investments from operating investments. My second rule applies to both tract and operating investments.

The third rule is often violated, frequently because the first rule about knowing the facts is violated. Don't invest $5000 to earn $1000 if you can earn $1000 by investing $200.

Labor Rules

It is not what you pay labor, it is the profit it yields you that counts.

It is a general law applying not only to labor but also to equipment and to materials that the best grades are relatively cheaper than poor grades. You know that this applies to coal.

Mr. Mellen, former president of the New York, New Haven & Hartford, is quoted recently as saying that no railroad official is worth more than $25,000 a year. He said that he would have worked just as hard for $25,000 as he worked for $75,000. This may be true. Caruso may sing just as well at a charity concert as in grand opera for $5000 a night. It does not follow, however, that you could get Caruso for $50 a night. The right president for the New Haven would have been cheap at a million dollars a year, if he could not have been secured for less.

The one efficiency rule as to labor is to determine what you can afford to pay and then put in your time and your skill and your energy finding the best men that your permitted pay can buy.

In coal mining you have the scale. You are prevented from going below a certain amount. I have never seen a coal mine yet in which money was spent to best advantage for labor.

This is so tremendously important a subject that I wish I could dwell upon it. Take it from me that your descendants 100 years from now will have learned to handle labor in the way you ought to be able to handle it today. A strike seems to me not only a preventable thing but a ridiculous, a stupid thing like the sinking of the Titanic or the wrecks on the New York, New Haven & Hartford Railroad.

In these two rules: (1) Handle your capital economically; (2) handle labor economically, is laid down the basis for efficient coal mining.

How to handle capital and labor efficiently is the chief business of the great executive. There are many principles, not rules or devices, that will guide him, and without these principles he cannot succeed. Some great geniuses know the rules instinctively. The rest of us poor mortals have to learn them. Some boys learn to swim by themselves, most of us are taught to swim. But unless we know how to swim we shall surely drown if we fall overboard even if we are not 20 ft. from shore.

Some of the principles for efficient direction are:

Definite ideals, definite authority and responsibility, constantly available and used competent counsel, strict discipline, fair dealing, high and immediate efficiency reward.

The main principles for efficient supervision are that every part of material, of equipment, of personal work shall be designed, specified, selected, tested, conserved and inspected with continuous intelligent care.

The main principles of successful management are that there shall be balance between the three great human incentives—action, appetite and inspiration.

The main principles of successful operation are:

(1) Standardized conditions; (2) standardized operations; (3) advance planning; (4) standards and sched-

---

*Efficiency Engineer, 30 Church St., New York.

ules; (5) dispatching of all work; (6) standard practice instructions; (7) records, reliable, immediate, available, classified and adequate.

As to Particulars

A few years ago I was one of a committee which made the following report on a coal mine in a receiver's hands:

"If the coal properties are shut down, the annual loss will be $420,000.

"If they are operated at the standardized cost per ton of $0.857 and for an output of 3,000,000 tons and the coal is sold at the price realized last year, $0.8097, the loss will be $141,900.

"The standard cost includes a charge for interest of $0.067 and for depreciation of $0.058, a total of $0.125 per ton.

"The standard costs are 14.8 per cent. lower than 1909-10 corresponding costs, 17.4 per cent. lower than July and August, 1910, corresponding costs."

This short report was amplified into the following:

Our Findings

(1) The coal lands have been injudiciously acquired.

(2) Money has been injudiciously spent in equipping the plants.

(3) Overhead charges for interest, maintenance and depreciation are therefore high.

(4) The present market selling price for coal is so low as to make profitable coal mining difficult, if not impossible, even if the coal lands had been secured without price, and had been equipped with rigid reference to economical operation.

(5) The present situation would be most effectively bettered if the market price of coal increased.

(6) To shut down the mines and wait for better prices would entail an annual expense for power, maintenance, supervision, depreciation and interest of $420,000.

This does not include an annual charge of $104,494 on book value of coal lands not immediately identified with the plants to be operated.

(7) The cost of mining coal if operations are standardized, will be $0.857 per ton for a daily output of 12,000 tons, a monthly output of 250,000 tons and a yearly output of 3,000,000 tons.

(8) The loss from continued operation will depend on the price obtained for coal sold:

At $0.66 loss will amount to	$561,000
At $0.70 loss will amount to	420,000
At $0.70 loss from operations and loss from suspension of operations will be equal.	
At $0.79 loss will amount to	200,000
At $0.8097, price netted by coal sales in 1909-10, loss from operation will be	141,900
At $0.857 there is neither loss nor profit from operation.	
At $0.921, profit above operation	192,000
This is sufficient to pay interest on obligation. Coal should therefore continue to be mined.	
At $0.948, profit from operation	272,000
This pays for operation, for moneys owed and for present administration charges.	

(9) While waiting, hoping and working for better coal prices, costs of operations are to be standardized;

(a) By revaluing all the lands and equipment, thus reducing future operating overhead charges;

(b) By putting the management of inside and outside operations in the hands of a competent and experienced man of reliable character;

(c) By giving him all the assistance possible from modern business organization and methods adapted from other bituminous coal-mine operations and industrial enterprises;

(d) By concentrating operation at that plant, or those plants, where coal can be mined most cheaply;

(e) By investigating the advantages, if any, to be derived from coking the product of these mines;

(f) By investigating the advantages, if any, of establishing a washery at the mines.

Standards and Standard Table of Costs

In making its investigations your committee attempted to determine a standard cost per ton of mined coal for a standard output, which we assumed at 3,000,000 tons each year.

The standards adopted for immediate use are:

(1) The present standard mining scale for mining labor, $0.485.

(2) Current rates of wages for a minimum amount of other efficient working labor, $0.175.

(3) Moneys for supervision, supplies and other bills, taxes, insurance, etc.; an efficient minimum, $0.07.

(4) Depreciation charges based on revaluations, on experience, and on the present ascertained coal reserve tributary to operating plants, $0.06.

(5) Interest at 6 per cent. per annum on reappraised values of coal reserves, mining buildings, equipment, etc., actually used for mining operations, $0.067.

The company has other expenses not standard and not directly appertaining to mining operations. These expenses are:

(6) Interest and other charges on investments at present inoperative, $0.029.

(7) Excessive interest load, due partly to investment in elaborate and unnecessary plants, partly to deficits accumulated from former years, and partly to other causes, $0.035.

(8) High costs of administration of the Company's business.

COSTS FOR 1910

Operation	$77,294	
Maintenance	14,156	
General expense, excluding insurance	37,912	
	$129,362	
Less allowance for mining operation	48,000	
	$81,362	
Cost per ton		$0.0271

The output of coal can fluctuate from no tonnage, if the mines are closed, to a maximum daily tonnage of 17,000 tons.

If this maximum of 17,000 tons daily could be attained it would reduce mining costs about as follows:

OUTPUT PER YEAR, 4,250,000 TONS

	Costs per Ton
Mining labor	$0.455
Other labor	0.15
Operation	0.06
Depreciation	0.06
Interest	0.045
Total	$0.77

TABLE ON BASIS OF 3,000,000 TONS ANNUALLY
Daily Output, 12,000 tons

	Costs per Ton	
1. Mining labor	$0.485	
2. Other labor	0.175	
3. Total working pay-roll (1 and 2)		$0.66
4. Operations	$0.07	
5. Depreciation	0.06	
6. Interest	0.067	
7. Total overhead charge (4, 5, 6)		$0.197
8. **Total standard cost per ton of coal (3 and 7)**		$0.857

The whole practical problem is to attain the standard costs, and it is this aspect of the situation which underlies our report.

Because the future is more important than the past, we have established standard costs for operation for the next year.

Having set up standards of cost for carrying output and having established current efficiencies we are able each month to show the exact losses due to inefficiencies and their cause.

We do not say vaguely, "You ought to mine for $0.10 a ton less." We subdivide the $0.10 above standard into perhaps 50 different items and point out not only the amount of, but also the cause of the excess or unstandardized cost in each."

If you know where and when and why losses occur, it is usually possible to prevent them.

The science of efficiency is applied to any business in a similar manner.

It is possible to have a great deal of system without any efficiency. It is possible to have great strenuousness without any efficiency. It is possible to have a minimum of system, a minimum of strenuousness, yet great efficiency.

⁂ ⁂

Industrial Safety

By Herbert M. Wilson*

SYNOPSIS—Some of the developments in the industrial-safety movement are here enumerated. Figures are also given, showing the decrease in coal-mining accidents during recent years.

⁂

The mining industry may point with pride to the fact that long before safety was considered in other industrial occupations, state legislation had been enacted making provision for mine inspection, and much has been done in the succeeding years to safeguard the workers, not only through the various state mine departments, but also through the private inspection maintained by the operators.

Up to a few years ago, the too oft-recurring mine explosions, with the long lists of dead and injured, and the reports of the daily accidents from minor causes, were accepted as inevitable to the industry. It was at this period that the impetus furnished by the first Conservation Congress and a series of coincident mine explosions awakened Congress to the necessity of investigating these disasters.

The propaganda which led to the creation of the Federal Bureau of Mines and the publicity created by its method of operation has in the interval aroused the mining community to a realization of the lack of safety and has given a quickened impulse for better conditions in every other industrial occupation.

It is a fact worthy of just pride, therefore, that not only has this industry led in state and in individual concern for the safety of its employees, but also it is the first—unless transportation be called an industry—to receive federal aid and encouragement. It should be a matter of still greater pride that the activity for safety in mining has pointed the need and the way for the guidance of the other industries.

Two New Societies Are Organized

Due perhaps in some measure to these causes, and in larger sense to the agitation for the enactment of workmen's compensation laws, and further in large degree to the activity everywhere evidenced for greater consideration of our fellow-beings, as voiced in Christ's commandment, "Love thy neighbor as thyself," last year witnessed the organization of at least two national societies concerned in furthering the safety movement.

First among these is the American Mine Safety Association, conceived in this city and now entering upon its first year. Its membership includes mine operators, mine inspectors, mine workers and physicians. It aims to secure as a member every man concerned in mining coal or ore. The good results from this organization are already evidenced in the more frequent field meets of miners, both for contests in and instruction regarding safety, the establishment of local branches of the association, a national mine-rescue corps, and a national first-aid corps.

At almost the same time there was conceived in Chicago the National Council for Industrial Safety, numbering in its membership the leaders in every industrial branch—railroads, manufactures, iron and steel, etc. This council will strive to coördinate the efforts of kindred organizations as a medium for exchange of information relative to those safety measures which may be applicable to the several industries.

The steel industry has perhaps pushed farther the introduction of safety appliances and safeguards around machinery, the organization of safety committees, and the awarding of prizes, than any other of the industries, while the manufacturing corporations—the National Cash Register Co., our own "57 Varieties" and their fellows—are spending hundreds of thousands of dollars in advancing the safety and welfare of their employees.

Meetings and Exhibitions in New York

The American Museum of Safety in New York held in the month of October its first annual exhibition of safety appliances in the Grand Central Palace. This exhibition was worthy of a long journey if only as an object lesson in the tremendous amount of energy and money being expended in every industry for the adoption of safeguards to human life. And next week there will be held in the same building a National Safety and Sanitation Conference.

Have you scanned the latest statistics of mine accidents? If so, have you noted that in the United States in the year 1911 there were 2719 persons killed in coal mines and 695 in metal mines; that there were 9106 seriously and 22,228 slightly injured in coal mines, and 4169 seriously and 22,408 slightly injured in metal mines,

---

*Engineer-in-charge, Bureau of Mines, Pittsburgh, Penn.

Note—Abstract of an article read before the Coal Mining Institute of America, Pittsburgh, Penn., Dec. 4, 1913.

while in all 61,325 mine workers were incapacitated for one day or over?

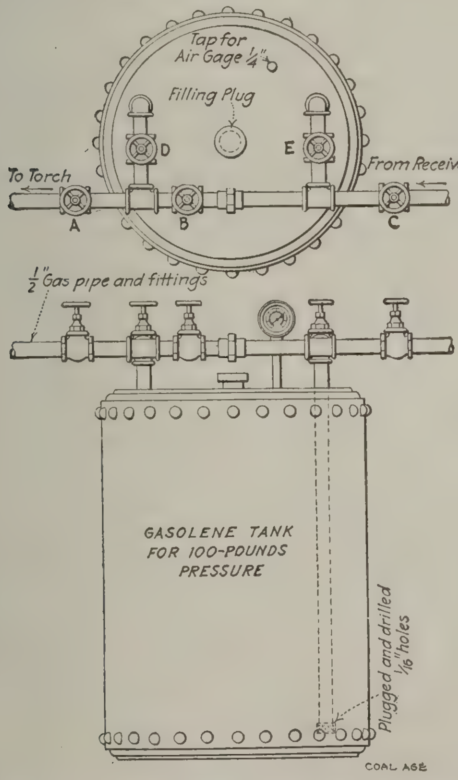
Humiliating as is the apparent indictment against the mining industry, conveyed in the above figures, yet they do not tell the whole story. There is comfort in the fact that in the last quarter-century, while there has been a constantly increasing ratio of men killed in the mines per thousand employed, or per million short tons of coal produced, the high-water mark was reached in 1907. In that year the death rate in the coal-mining industry alone was 4.88 per thousand men employed, or 6.93 per million short tons of coal mined.

During the last five years, up to and including 1912, there has been a constant and gratifying diminution in the death and accident rate, the number killed in 1912 being 3.27 per one thousand men employed, or 4.42 per million short tons of coal mined. No other industry can point to so splendid a record of safety work accomplished.

⁂

Removing Steel Tires from Mine-Motor Wheels

When tires must be removed from the ordinary mine locomotive, the usual custom is to heap coals of fire over the entire wheel until the desired degree of heat is obtained, then remove the wheel, cool the central portion, or all parts but the tire, then pull the latter off. This process is both slow and expensive, and frequently results in breakage of the cast portion of the wheel, since the spokes cool much more rapidly than either hub or rim.



The Gasoline Tank and Its Connections

While superintendent at the Tennessee State Coal Mine, the writer installed the apparatus here described to facilitate the removal of tires.

A Westinghouse locomotive air compressor was purchased and bolted to two 6x12-in. upright posts, located in the boiler house. This machine required but little space, being only 30 in. high, and 14 in. wide. An old boiler 30 in. in diameter and 7 ft. high was used as an air receiver, and connected by 1½-in. pipe to the compressor. A suitable air-pressure gage and safety valve were provided and installed upon this improvised receiver.

The air was conducted to the mine a distance of about 1200 ft. by 1-in. wrought-iron pipe. This was connected to a gasoline tank as shown in the accompanying drawing.

A torch was then made by bending a ½-in. pipe in a circle, the internal diameter of which was about 2 in. larger than the outside diameters of the tires to be handled. The ends of this circular pipe were then connected by means of a tee, provided with right- and left-hand threads on the run. Into the outlet of the tee a piece of pipe, about 5 ft. long, was screwed, this connected to a hose which in turn was joined to the gasoline tank.

The inner side of the circular torch was drilled with $\frac{1}{32}$-in. holes spaced 1½-in. centers. In order to keep the blast uniform, however, those holes which were located diametrically opposite the tee were drilled slightly larger than $\frac{1}{32}$ inch.

The method of operation was as follows:

The gasoline tank was placed at least 40 ft. from the locomotive wheel, and connected upon the inlet side to the air line from the main air receiver. The highly inflammable gasoline is thus removed 40 ft. from the flames. The discharge pipe is then connected to the torch. After all pipe fittings and connections have been made, the receiver is filled with as much gasoline as is necessary to do the work, ordinarily about three gallons. After this is done, the compressor is started and valves marked *C* and *E* are opened, until a pressure of between 35 and 40 lb. is registered by the pressure gage attached to the gasoline tank. Valve *E* is then almost entirely closed, being left but slightly open. Valve *A* is then opened fully, and valve *B* slightly opened. Valves *A* and *D* are then so adjusted that a mixture of air and gasoline is caused to flow through the pipe to the torch. This adjustment should be such as to secure a continuous blue flame.

The air used in the gasoline tank should be as dry as possible in order to keep water out of the fuel. Filling the reservoir about two-thirds full of excelsior will help to remove moisture from the air and adds materially to the work of the same.

In shutting down the apparatus in order to prevent a back suction, which is liable to blow up the reservoir, valve *A* should first be entirely closed. Valve *C* is placed in the line so that connection can be cut from the main receiver in case of trouble at that point. After the torch is burning properly, it only requires a few minutes' heating before the tire is ready to remove. Generally speaking, 40 or 50 tons is sufficient to take off a tire. This method, therefore, which is comparatively inexpensive to install, is much more efficient in every way than that of the old open fire.

⁂

A German method of reducing coal dust at working faces is to force water by means of high pressure into the coal through drill holes, thus wetting the coal, which reduces the amount of dust produced. It also helps to bring down the coal. This method gives best results in longwall mining, but can also be used in wide rooms

Selection of Coke Samples for Analyses

By Fred C. Keighley*

SYNOPSIS—Most of the phosphorus trouble that occurs in the manufacture of coke can be avoided if proper methods of sampling are followed. Several instances are cited from practical experience.

⁂

The sampling and analysis of coke have always been a source of much annoyance and uncertainty to the coke manufacturers and I imagine to the iron smelter as well; in fact, it has often been the cause of much bad feeling between the manufacturer of coke and the consumer of the same, not to mention the proneness to profanity of the parties involved in the controversies arising from the amazing seeming impossibility of getting two sets of analyses to be on terms of equality with each other.

To the average coke maker it seems to be the height of absurdity and unreasonableness on the part of the iron smelter to turn down said coke maker's coke on account of one- or two-thousandths of 1 per cent. of phosphorus, when said coke was first class in every other respect and acknowledged to be so by the iron smelter. The coke maker would say, "But the chemist gets different results and the one-hundredth part of a gnat's heel that you are kicking about does not exist," and so the arguments pro and con can proceed *ad infinitum*, much to the disgust of the participants.

I have been connected with coking coal and coke manufacturing operations in one capacity and another for over 30 years, and nothing ever caused a sinking of my heart and the changing of my complexion as much as that term phosphorus when it appeared in my morning's mail. It is a fact that I once lost a good position by reason of a difference of opinion as to the cause of the phosphorus barometer or constituent taking a trip of a couple of one-thousandths of 1 per cent. in altitude.

How I Lost My Job

My superior officer said one day: "The phosphorus in your coke is positively abominable," and I heartily agreed with him, but when he further remarked that I was the cause of such misbehavior on the part of the coke that I was producing, my temperature went up in an alarming degree and the atmosphere in that neighborhood immediately assumed a bluish aspect that smacked more of sulphur fumes than phosphorus. We stormed at one another by mail and the upshot of that correspondence was that I suggested that he take his coke works to a certain very warm climate, but he decided that it was a much simpler proposition to induce me to seek a cooler place which I did with great promptness.

The facts in the case were that the plant I had charge of at the particular time referred to had in its youth discreetly managed to keep a little shy of 0.02. Then it suddenly got to flirting with 0.022, with a further occasional looping-the-loop with the naughty shades of 0.03.

The figure 0.02 is the upper limit of decorum in bessemer coke etiquette, and flirting with fractions of thousandths of 1 per cent. above that is simply scandalous in a high degree. At the time I refer to, the superintendent of a coke works did not know what the constituents of the coal he daily produced were. All he knew was that the resulting coke had a good behavior record, an indifferent one or a vile one, as the case might be. Such a thing as sampling coke and coal regularly was considered a piece of extravagance not to be tolerated for one moment. The iron smelter was the fellow to cut such capers as that and even he only did it when his furnace got the stomach trouble and the gastric juices were unfavorable for the delivery of the correct thing at the hearth of the furnace.

Phosphorus Was Due to a Fault

To make a long story short, it was discovered some months after my leaving the works in question, that a very large fault crossed the coal field operated on and the high phosphorus contents of the coal were in some way due to the near presence of that fault. Many of us have more or less phosphorus troubles even now, in spite of the better facilities afforded to the coke manufacturers to ascertain the chemical constituents of not only the coke, but the coal. With large coke producers it is now customary to have a chemist to look after troubles of this kind and thus assist the management in keeping tab on that very mysterious element, phosphorus.

No chemist, no matter how skillful he may be, or how great his experience might have been, can lay his finger on phosphorus, and tell you where it came from and what to do with it; however, he does know where it invariably goes when it gets associated with the contents of a blast furnace. There is as yet no known way of reducing or driving off phoshorus in either the coal or the coke and about the only thing that can be done is to sample both coal and coke regularly and carefully and have the same analyzed as regularly and carefully by a competent chemist. This, as before stated, is the practice of uptodate coke-makers, and the same will apply equally to the iron-smelting management.

There will be a difference between the findings of the different chemists of given samples, but with care the phosphorus determination should not be more than one- to three-thousandths per cent. apart. After much thinking, some trying experiences and just a little "cussing," I have about come to the conclusion that where the chemists are so far apart in their determinations of the phosphorus constituent of the coke or coal as the case may be, that in all probability the method of sampling and the preparation of the same have a great deal to do with the difficulty referred to.

A short time ago my attention was called to the fact that a certain heretofore low-phosphorus coke was changing its complexion. I could not believe this at first, but, as you no doubt know, these chemists have such a persuasive way about them that I was compelled to sit up and take notice. Remembering my experience in the past as cited to you in the other paragraphs of this paper, I advised the parties interested to go after the coal, and the result was that in a certain section of the mine where the pillars were being taken out, the coal upon analyses ran up to 0.077 in phosphorus, which would be equivaent to 0.115 in coke. A short distance away from the point just named going westward the phosphorus showing was 0.040 to 0.060 in the coke equivalent. It would be as well to remember that the phosphorus showing in a given sample of coke is generally about one-half higher than that shown by the coal analysis.

---

*General superintendent, Oliver & Snyder Steel Co., Oliver, Penn.

Note—Paper read before Coal Mining Institute of America, Pittsburgh, Penn., Dec. 4, 1913.

Phosphorus Decreased as We Went Westward

The culprit having been caught, as it were, at the fountain head, a series of samples were taken on a westward course, and this resulted in getting results as given by the following figures. These figures stand in the order of the sampling as it proceeded westward: 0.032, 0.029, 0.021, 0.021, 0.012, 0.011, 0.011, 0.010, 0.009, 0.009, 0.008, 0.006, 0.006, 0.006, 0.005.

I have not been able to figure out just what law this diminution of the phosphorus contents in coal works under, but it certainly was a godsend to the parties to discover that the high-phosphorus coal existed only in a small portion of the mine territory, yet the results of the coke analyses were not entirely satisfactory, at least not as good as a small quantity of high-phosphorus coal output would indicate. In view of this fact the next thing to be done was to follow up the coke problem.

When this difficulty first appeared, samples were taken from the coke cars as follows: A typical piece was taken at one end of the coke car, one was taken from the middle and a third from the remaining end of the car while the same was in process of being unloaded. This, of course, meant three samples from each car and made quite a bulky pile when any considerable number of cars were sampled. The samples gotten in this way were gathered up and reduced by hand to a general sample. This did not bring the expected results. Full-length samples were then taken from every oven at three different points and again reduced to general samples. Still there was trouble.

Finally, at the suggestion of a chemist of well known ability and experience, samples were taken at several points in each oven, such points being designated on a blueprint showing a horizontal section of the whole oven, such section being divided into three concentric circles of equal area and samples taken in such number and at such points as to give a fairly accurate sampling of the whole of the output of the ovens under observation and consideration. This was the best method of all but still things did not seem to "gee" just as they should.

At this stage, it was apparent that the method of gathering up and the division of the samples for procuring a general sample of the coke was largely responsible for the difficulty, and I intimated this to said chemist. He came to my aid again and suggested that a "Chipmunk Crusher" might be a good thing to get and use in connection with the sampling of coke. Such a crusher was installed, and the results were of a most encouraging character; in fact, the crusher nearly eliminated the trouble.

In conclusion, I will say that there are still some features bobbing up occasionally that furnish food for reflection, but I believe there is not the slightest doubt that the bulk of the phosphorus trouble in question came through the poor methods of sampling and the lack of knowledge as to the best method to be adopted in that connection.

This paper is not intended to be final, but rather is written with a view to open up an intelligent discussion as to what can be laid down in the way of a method of procedure that will attain or reach the best possible practice along the lines of coke sampling and the preparation of same for the chemist's work, which is certainly of the greatest importance to both coke producers and iron smelters.

Perhaps it would be as well to state that this paper was written principally from a bessemer-coke standpoint, i.e., on coke that was intended to be used in connection with the bessemer process of refining iron. In the case of iron smelting that later on is to be refined by basic process, phosphorus is not nearly so serious a question, as that element is taken care of in the openhearth furnace; however, there is a limit to the percentage of phosphorus that can be tolerated even there.

⁂

A Portable Sheave for a Gravity Plane

One of the most interesting applications of the gravity plane is to the lowering of ore and the hoisting of empty skips in the stopes of the North Star mine, Grass Valley, Calif. It may well be recommended for use in coal mines where the rooms are steep. At the same time, where the grade is not too heavy for standard cars and where the inclination is not so steep but that a car can be fully loaded, the methods should be modified so that cars instead of being dumped at a battery may be run out onto the heading. The gold-ore vein at the North Star mine lies at 23 deg. to the horizontal. The head sheave, says L. O. Kellogg, in the *Engineering and Mining Journal*, has three pulleys, as illustrated in Figs. 1 and 2.

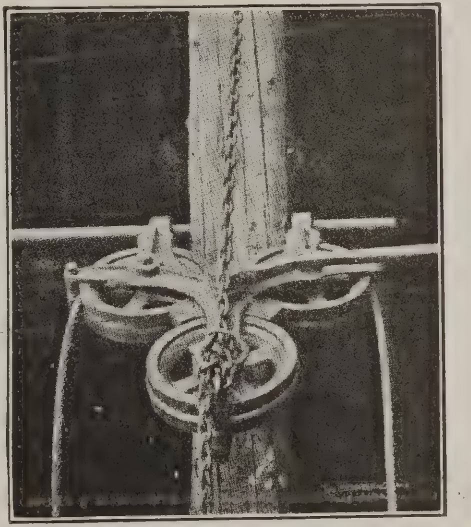


Fig. 1. Go-Devil Head Sheave in Position on Post

The rope passes up on the outside of the outer pulleys, down the inside through grooves in the brake block and around the lower edge of the third pulley. The brake block is triangular, pivots about its center in between the three pulleys and is operated by a handle attached to the square head shown. It is brought to bear on all three pulleys and thus gives a strong braking effect. Passing around all three, with a large angle of contact on each, the rope has no opportunity to slip.

The brake lever can be locked in position by extending the handle with a piece of pipe and by connecting the end of this to a lever with a ratchet lock set on a stout post. The two halves of the triangular spider-frame, the three pulleys and the brake block make six castings entering into the device, besides the bolt, nuts and handle. The manner of suspending the block by a chain and a bolt through the post is shown in Fig. 1.

A ⅝-in. steel-wire rope is used and is attached by means of a safety hook. As there is only one car weighing about 3000 lb. on the down grade, and, as much energy is lost in the unavoidable friction in the head block, the gravity plane or "go devil" as it is called, will not operate below a 5-deg. slope and with difficulty below a 10-deg. When a 35-deg. inclination is reached, the operation of the plane is difficult and sometimes dangerous.

⁂

Coal and the Panama Canal

Under the above caption, *The Iron and Coal Trade Review* (London, England), says editorially in its issue of Nov. 7, as follows:

> News comes to hand from the United States that American coal producers and manufacturers are laying ambitious plans for the extension of their export trade in view of the imminent opening of the Panama Canal. It is stated that several companies, formed with that end in view, have now been organized and have secured depots on the Gulf, and the Central and South American coasts for the purpose not only of supplying bunkers to ships but also of sending coal inland.
>
> We are told, too, that lines of steamships, some units of which are being built in this country, are being formed specially to meet the expansion in trade which the Canal is expected to bring about, and also that arrangements are being made to secure return cargoes. It seems probable that some such preparations may be in progress, but whether they are on the stupendous scale outlined in the advices from across the Atlantic is another story.
>
> There can be no doubt, of course, that the opening of the Canal, providing us as it does with a new and most important trade route, offers great business possibilities so far as the bunkering trade is concerned, and in view of their geographical advantage the coal producers of the United States will probably absorb most of it. It remains to be seen how much shipping will be diverted from Suez to the new route. That will depend in some measure upon the prices charged for American coals at Panama.
>
> A statement is made to the effect that the United States Government proposes to supply best quality steams at about $4.55 per ton at either end of the Canal, which is about $2.40 less than the f.o.b. price of Durham unscreened bunkers at Port Said. No official announcement on the subject appears to have been made, however, and it has also to be remembered that every vessel passing through the Panama Canal will not necessarily bunker there any more than every vessel passing through the Suez Canal bunkers in that locality.
>
> **Possible Changes in Trade**
>
> Beyond the bunkering business it is difficult to see how the opening of the Panama Canal will benefit the American or injure the British coal trade to any great extent. It will not alter our position with regard to the Atlantic States, to which the great bulk of our South American coal exports is shipped. The Pacific Coast of South America will certainly be more vulnerable to American attack, but our exports to those markets are not very large and, moreover, British firms have secured an excellent footing there; on the confession of the accredited Consular representatives of the United States in the countries in question, it will be difficult to shake our hold on these markets.
>
> It is easy, therefore, to exaggerate the consequences of the opening of the Panama Canal so far as our coal trade is concerned, and we feel sure that British exporters having connections with markets likely to be affected at all are fully alive to possible dangers and are taking steps accordingly. In his paper on the Panama Canal, read before the British Association, Professor Kirkaldy seemed to suggest that it might enable the United States to displace British coal throughout the world, and he urged both the capital and laborer interested to forget internal causes of difference and to unite against the common enemy.
>
> This certainly appears to be an entirely alarmist view of the situation. For some years past now our American friends have been paying more attention to their coal-shipping trade, which, while still small as compared with our own, has increased rapidly of late. It is certain that they are not likely to miss any fresh opportunities which the opening of the Canal may afford them, but why this impending event, important as it is, should deliver a mortal blow to the British coal-shipping trade, we cannot conceive. It is better to be warned, however, even in exaggerated terms, than to remain over-confident when a wealthy and enterprising rival is in the field and it will be well to keep an eye upon the activities of our American competitors.

⁂

Bureau of Mines Appropriations

The estimates of appropriations for the United States Bureau of Mines, for the fiscal year ending June 30, 1915, as approved by Secretary Lane, of the Interior Department, have just been forwarded to Congress.

The estimates are as follows:

For general expenses of the Bureau of Mines, $70,000.

For investigating mine accidents, $347,000.

For the equipment of mine-rescue cars and stations, $30,000.

Equipment of testing plant at Pittsburgh, Penn., $10,000.

For testing fuels, $135,000.

For mineral-mining investigations, $120,000.

For inquiries and investigations of petroleum and natural gas, $30,000.

For inspection of mines in Alaska, $7000.

For books and publications, $2000.

For lands, leases, etc., for mine-rescue cars, $1000.

The total for the Bureau of Mines is $752,000, an increase over the fiscal year ending June 30, 1914, of $90,000.

The item of $30,000 for equipment of rescue cars and stations is for the first time placed separately in the estimates and represents an increase.

The $10,000 asked for the equipment of the testing plant is a new item. The money is needed for the purchase of steam and electric equipment. The estimates set forth that the present power- and electric-service plant at the experiment station is on the eve of breakdown.

Some Notes on the Selling Price of Coal

By R. A. Colter*

YNOPSIS—A discussion of this important question long original lines. The author points out the low earnngs realized in the coal business and states that steps nust be taken to obtain a better profit. A closer coöperaion between the operating and selling departments is esential. Also a more careful study of costs.

⁂

It is my intention to discuss the selling price of coal vith regards to what relation it bears to the cost of proluction and how and by whom it is fixed. Wonderful rogress has been made in the way of ascertaining definite nd accurate costs of production; in the mining field this as resulted, in some cases, in the reduction of costs, but n most instances an increase, on account of the more cientific methods of mining and the safeguarding of life nd property.

Often where this scientific analysis of cost indicates an ncrease, it is probably more imaginary than real for the eason that the coal had been actually costing what the nalysis showed and the producer had previously been aboring under a misapprehension. Therefore, when he wakens to the fact that the margin between the actual ost and the selling price had been greatly overestimated, e immediately wants more money for his product.

Fixing the Selling Price

Answering the query—What should be the relation of he selling price to the cost, I would say: The selling rice should be:

The Cost of Production
Plus
A Reasonable Charge for the Money Invested and Risk Involved
Plus
The Cost of Selling.

Assuming, of course, that the producer has an average plant, with no extraordinary features, no excessively expensive or elaborate equipment or administrative quarters, is cost is upon an equality with his neighbors and competitors, at least in his own field. His money is no better nd worth no more, his risk is equal but no greater, and he proper returns upon his investment is easily established.

The cost of selling depends upon the method. It is not my intention to discuss this question, although allusion may be made later to it, but it is worthy of the same careful research as the cost of production and might well be more definitely known. In answering the question of the relation of the selling price, we have, it seems, described how it should be made and are now ready to determine by whom it should be made.

The responsibility for the low returns in the past cannot be entirely shifted to the shoulders of the selling agent, whether or not he be a producer as well, for the ignorance of the cost on the part of the producer has often misled the selling agent. But we see improvement in this direction by the closer relations between the producer and seller. There was a time when it was only necessary to learn at what price a certain grade of coal was being put into a certain market; that figure was then met or cut, as the case might be, the freight deducted and the balance was the price of the coal. In more remote instances, the process was reversed; the delivered price was made in the same manner but the operator was paid the least he would take for his coal and the railroad took the balance for the freight.

Coöperation between Producer and Seller

This condition having either corrected itself or killed itself, there sprang up another in its stead. The seller appeared who dealt only with tonnage and whose only thought was to move enormous quantities, his interest being solely in the commissions involved or earned, and not how much could be obtained for the coal.

This can only be corrected by coöperation between the producer and the seller by which they are brought to see that their interests are not separate and antagonistic but mutual and interdependent. The two branches, producing and selling, are distinct and the one requires quite as much business acumen and integrity as the other but they can and must be harmonized.

Thus far we have discussed the selling price of coal upon the basis of fixed charges and have not taken into consideration any contingencies that might arise, such as the demand, abnormal market conditions, terms of delivery and payment, all of which affect the selling price to a greater or less extent. A shipper not long ago, during a conversation, remarked, "There is no such thing as a market price, it is simply what you can get for it." This is in a large measure true, but if one is imbued with a knowledge of what one's commodity costs, how it is prepared and under what conditions it is produced—he is more likely to get more for it than he would otherwise.

The fact that a gas coal from another field is being sold in a certain market at what would be a low price for another coal of the same kind does not necessarily warrant the owner of the second lot in meeting that price; instead he should endeavor to find another market which will bring a reasonable figure.

The present knowledge of accurate costs on the part of the producers was not attained in a single day and not without many conferences and much interchange of thought and ideas. This has in some measure been reflected in a more equitable selling price, but it will require considerably more work on the part of both the producer and the distributor to educate the buying and consuming public to the readjustment of prices which is bound to come about soon.

The innovations and reforms in mining and producing coal are not accomplished without some opposition from those whose cherished ideas and pet theories are upset. Neither can the reforms in the handling and selling be accomplished without a frank discussion of the ignorance, errors and abuses attendant upon that branch of the business.

Having assumed that the producer has an accurate cost of production for a start, the question of a reasonable return on the capital involved is next in order. The figures compiled by the Federal Government place the average returns of all mines in the United States for the year 1909 at 3 per cent. on the capital invested, the coke-making mines of Pennsylvania and the Connellsville district being the only exception, these showing returns of over 6 per cent.

---

*Secretary and treasurer, the C. G. Blake Co., Cincinnati, Ohio.

Note—Paper read before the winter meeting of the West Virginia Mining Institute at Charleston, W. Va., Dec. 8-10.

The coke-making mines of West Virginia showing returns of 3.5 per cent. and the others a deficit.

The three leading coal-producing states are Pennsylvania, West Virginia and Illinois. These show returns as follows: Pennsylvania, 4.6 per cent.; West Virginia, deficit of 0.9 per cent.; Illinois, 1.7 per cent.

Does this not show conclusively the necessity for figuring on a larger percentage on the investment than has been the custom?

Notes on Selling

As to the cost of selling, this varies according to the volume and method of marketing. While it is a profitable field for discussion, I think there is much misapprehension on the part of the producer as to the actual cost of doing business these days. Especially is this true where the territory is of unlimited proportions, this being partly brought about by numerous inquiries during an active market from more or less unreliable parties, many whom have only desk room in some large jobbing center with little or no financial responsibility. Flattering promises lead the unthinking operator to imagine that his entire product can be sold without any effort. These undersirables are only heard from during active periods, while the legitimate sales agent is hard at work the year round to keep your plant in operation and at the same time maintain the market, which is no small job, I assure you, and worthy of the best efforts of any man.

Then the matter of terms is important. The measure of a tradesman's profit is determined by the time required for the turnover of his stock. If everyone's terms were identical, say, 30 days net, it would be a simple matter, but when we consider that the interest for 60 days at 6 per cent., is from 1c. per ton on $1 coal to 2c. per ton on $2 coal, it can be readily seen how much of the selling price is lost in extra time given buyers.

It is indeed unfortunate that the Federal Government having done so much toward educating the producer to the true value of his property, the scientific compilation of his costs and the safeguarding of life and property, has not been as zealous and active in teaching and helping him to secure a reasonable return for his product. The day of segregated individualism has passed and we have entered upon an era of collective effort which, rightly directed, will redound to the benefit of all. While I am not a prophet, I believe that in the not far distant future there will be a radical change in the attitude of our Federal Government toward the securing of a reasonable return for the product of our mines.

Manufacture and Character of Basic Coke

By J. R. Campbell*

SYNOPSIS—Basic coke cannot be made in beehive ovens as the temperature is insufficient. It can be manufactured in byproduct ovens but only one-third of the original sulphur is converted into calcium sulphide. However, by the addition of lime to coal in the oven to make basic coke, some of the volatile sulphur is retained in the fuel which would otherwise be expelled. As the sulphide is not incapable of reduction in the blast furnace, there is no assurance that basic coke is desirable. Its chief value seems to be that coals which will not fuse into reliable coke can be made to agglomerate with slag as a binder as a result of the addition of a large percentage of lime.

⁂

Sulphur in coke is almost wholly present as sulphide of iron (FeS), or perhaps more properly speaking as the magnetic sulphide (Fe_7S_8) and as such it readily dissolves in the iron during the smelting process, unless it is carried into the slag by the use of suitable fluxes. In blast-furnace practice, limestone, which is charged with the ore and coke, slags this sulphur impurity as well as performs other functions.

It is generally believed that the sulphur, in whatsoever form it is introduced into the furnace, is transformed into calcium sulphide (CaS) at high temperatures and, by virtue of its lighter specific gravity, floats off with the slag instead of dissolving in the metal. From this belief is deduced the well known axiom of the furnaceman: "A hot furnace makes iron, which is low in sulphur and high in silicon and a cold furnace makes high-sulphur and low-silicon iron," which is true, unless the furnace is run hot and limy when both sulphur and silicon will be low.

Why Coke Should Not Have over One per Cent. of Sulphur

In passing it may be remarked that the chief source of sulphur in blast-furnace operation is the coke; hence it is easy to understand why the furnaceman always has his "weather-eye" open for the sulphur content of the fuel, especially if it runs over 1 per cent. The average coke operator knows what it means to try to pacify an irate furnaceman if the coke plant has unfortunately shipped a few cars of coke above the prescribed limit in sulphur. Of course, up in the Connellsville region we would not like to be accused, nay, even suspected, of such a breach of metallurgical etiquette, where by repute we have the finest coking coal in the world.

This brings us to the question, "Why does the furnaceman object to more than 1 per cent. of sulphur in the coke?" For often the coal operator is apt to think that the ills of the furnaceman are largely imaginary, and that he is seeking to excuse himself by venting his spleen on the coke, but there is a valid reason why sulphur should not much exceed 1 per cent. if the furnace is to make good iron. Using round numbers, a ton of coke makes a ton of pig iron, and usually about a half ton of slag is produced in the process from which it is easily deduced that with a furnace working properly, the one-half ton of slag must carry all the sulphur in the ton of coke, that is, it must remove twice as much sulphur per ton as each ton of the coke contains.

---

*Chief chemist, H. C. Frick Coke Co., Everson, Penn.

Slag Can Dissolve only 2 to 2½ per Cent. of Sulphur

Thus, if a 1 per cent. sulphur coke is used, the slag will have to carry about 2 per cent. to remove the sulphur completely from the iron. Now the practical limit of solubility of the sulphur in the slag is usually considered to be from 2 to 2½ per cent. In other words, unless the furnace is run very limy, which practice is more or less detrimental to the lining, we do not expect the slag to hold more than 2 to 2¼ per cent. sulphur. There are rare instances, however, where the slag has carried 2½ per cent. of sulphur or even more for a considerable length of time.

This limit to the solubility of sulphur in slag is the main reason why the furnaceman does not like his coke to contain much more than 1 per cent. of sulphur. Coke containing much more than 1¼ per cent. of that element has but little metallurgical value for the economical manufacture of low-sulphur iron.

The Attempt to Make Basic Coke Is Not New

In view of the foregoing, many attempts have been made to improve the chemical quality of coke from the sulphur standpoint during its manufacture. This paper concerns itself only with the addition of crushed limestone to the charge of coal or the formation of basic coke. The idea is old. Fulton tried it a number of years ago. I believe he mentions it in his book on "Coke." Lately the scheme has been revived, both here and abroad, the claim being made that the cause for past failure lay in the fact that the mixtures were not scientifically proportioned.

How the Limestone Required Is Calculated

According to the claims of these latest investigators, the limestone must be added in proportion to the ash in the coal to form a slag consisting of a monosilicate of lime. In other words, the limestone addition is calculated much after the manner of determining the burdening a furnace. The following table and example will show how this calculation is made:

TABLE FOR THE CALCULATION OF MONOSILICATES

1 part of SiO_2 combines with:		1 part of base combines with:	
1.0 SiO_2	1.86 CaO	1.0 CaO	0.535 SiO_2
1.0 SiO_2	1.33 MgO	1.0 MgO	0.750 SiO_2
1.0 SiO_2	1.14 Al_2O_3	1.0 Al_2O_3	0.873 SiO_2
1.0 SiO_2	2.40 FeO	1.0 FeO	0.416 SiO_2
1.0 SiO_2	1.77 Fe_2O_3	1.0 Fe_2O_3	0.562 SiO_2
1.0 SiO_2	2.36 MnO	1.0 MnO	0.422 SiO_2
1.0 SiO_2	1.91 Mn_3O_4	1.0 Mn_3O_4	0.524 SiO_2
1.0 SiO_2	7.43 PbO	1.0 PbO	0.134 SiO_2
1.0 SiO_2	3.32 $CaCO_3$		

The table shows in the second column the weight of the bases required to bind 1 part by weight of silica (SiO_2) as monosilicates. The fourth column shows the weight of silica (SiO_2) required to bind 1 part by weight of the various bases as monosilicates.

To calculate CaO as $CaCO_3$ multiply by 1.7857.

COAL ANALYSIS

	Per Cent.
Volatile matter	39.05
Fixed carbon	52.34
Ash	8.61
	100.00
Sulphur	2.09

COMPOSITION OF ASH

	Per Cent.
Silica	47.85
Iron oxide	15.84
Alumina	23.98
Lime	4.41
Magnesia	1.66
Sulphur	1.11
	94.85

4.41 of lime × 0.535 = 2.36 per cent. silica (SiO_2) taken care of by lime
1.66 of magnesia × 0.750 = 1.24 per cent. silica taken care of by magnesia

Total 3.60 per cent. silica taken care of by lime and magnesia

47.85—3.60 = 44.25 per cent. silica remaining to be taken care of
44.25 × 3.32 = 146.88 percentage of $CaCO_3$ needed for every unit of ash

$$\frac{146.88 \times 8.61}{100} = 12.65 \text{ per cent. } CaCO_3 \text{ or limestone needed to flux the ash.}$$

From the above, we calculate that 12½ per cent. of limestone, of good quality, is needed to flux the ash. It is the hope also that the sulphur in the coal will pass into the slag during the coking process. Both the coal and limestone must be crushed very fine. The coal should all practically pass a ⅛-in. screen, and the limestone, a 20-mesh screen. The mixture must be intimate and thorough.

Basic Coke in Beehive Ovens a Total Failure

The ash in the coal under test in beehive ovens ran about 8 per cent. The limestone additions were made gradually, as it was early discovered that the physical quality of the coke was impaired, it being soft and crumbling easily.

ANALYSIS OF BASIC COKE

Per Cent. Ash	Per Cent. Sulphur	Per Cent. Phosphorus	Per Cent. Lime in Ash	Per Cent. Sulphur in Ash	Per Cent. Limestone Added
13.93	0.882	0.008	1.65	0.264	3
15.85	0.918	0.010	4.18	0.537	5
19.17	0.878	0.008	5.72	0.594	7½
19.90	1.000	0.013	6.34	0.911	10
27.19	0.942	0.012	12.24	0.998	12½
25.90	1.015	0.010	12.13	1.002	15

ANALYSIS OF RUN-OF-MINE COKE

	Per Cent.
Volatile matter	0.75
Fixed carbon	87.07
Ash	12.18
Sulphur	0.891
Phosphorus	0.014

About 12½ per cent. of limestone was theoretically required to form the so called basic coke, but this high percentage rendered it practically worthless. Failure to secure high enough temperatures in the beehive process may be ascribed as the reason. It is an internal-combustion process and the large quantities of "black damp" (CO_2) given off by the decomposition of the limestone, seemed to smother the fire. In fact, the conclusion was reached that "basic coke" by the beehive process, was a total failure from the physical standpoint.

Basic Coke in Byproduct Ovens

More promise was held forth by the byproduct ovens, as it is a retort method, external heat being applied, but here, too, the claims for "basic coke" were not completely realized.

The temperature of the coking mass is not high enough, even in byproduct practice, to cause the sulphur to pass into calcium sulphide (CaS) during the coking process, as evidenced by the following data:

TEMPERATURES IN COKING MASS OVEN NO. 47 TEST NO. 1

Time	Hole No. 1 Deg. F.	Hole No. 2 Deg. F.	Hole No. 3 Deg. F.
5:30 p.m.	350	325	275
6:00 p.m.	200	225	200
6:30 p.m.	200	225	200
7:00 p.m.	200	270	250
8:00 p.m.	220	250	240
9:00 p.m.	230	260	250
10:00 p.m.	230	260	240
11:00 p.m.	240	280	240
12:00 m.	240	280	240
1:00 a.m.	280	290	250
2:00 a.m.	380	320	250
3:00 a.m.	690	360	290
4:00 a.m.	1220	420	380
5:00 a.m.	1300	720	620
6:00 a.m.	1360	1060	822
7:00 a.m.	1400	1120	880
8:00 a.m.	1580	1550	1510
9:00 a.m.	1700	1700	1680
10:00 a.m.	1770	1770	1770
11:00 a.m.	1920	1920	1950

TEMPERATURE AS PUSHED

Location	Pyrometer	Deg. Fahr.
Hole No. 1	Hoskins	1814
Hole No. 2	Hoskins	1814
Hole No. 3	Hoskins	1830
On the coke mass	Wanner	1938
On the oven walls	Wanner	1992
Flue on No. 46 (pusher side)	Wanner	2370
Flue on No. 48 (pusher side)	Wanner	2300

The study of the temperature chart is interesting. Hole No. 1, for the pyrometer, was located in the charge near the side wall, No. 3, in the center of the charge, and No. 2, at an intermediate point, all on a line at 45 deg. inclination to the axis of the door of the oven. The maximum temperature in the coking mass in good practice was about 1900 deg. F., and rather strange to say even at the beginning of the process it was about as hot in the middle as at the sides, yet raw coal would have appeared in the center had the coke been pushed ahead of time. The flues on either side showed a temperature of about 2400 deg. F.

Only One-Third of Original Sulphur Is Combined with Lime in Byproduct Basic Coke

The analyses of the coal used showed ash 8.61 per cent. and sulphur 2.09 per cent., and the composition of the ash showed that 12½ per cent. of limestone was necessary to form a flux. These detailed analyses have been given elsewhere.

Only one-third of the original sulphur in the regular coke is changed to calcium sulphide (CaS) in basic coke, in which form it is supposed to pass through the blast furnace unchanged and float off into the slag instead of passing into the pig as iron sulphide (FeS) does. This percentage is too small to have metallurgical significance.

Furthermore, the sulphur is higher in basic coke than in run-of-mine coke, due to the lime of the limestone taking on some of the otherwise volatile sulphur in the coal. It was supposed that the limestone would not be decomposed by the heat of the coking process until all of the volatile sulphur had been driven off, but practically this was not true.

Physical Properties of Basic Coke

Another of the claims for basic coke is that the physical quality is improved by the addition of limestone to the coking charge. Within certain limits this is true in byproduct coke—never in beehive coke. The improvement is due to the slag binder if the proper temperature is attained, otherwise the free lime, upon exposure to the air, slakes and causes the coke to crumble and fall apart.

COMPOSITION OF COKE

	Run-of-Mine Coke Per Cent.	Basic Coke Per Cent.
Volatile matter	0.90	2.34
Fixed carbon	85.51	72.70
Ash	13.59	24.96
	100.00	100.00
Sulphur	1.62	1.76

COMPOSITION OF THE ASH

	Run-of-Mine Coke Per Cent.	Basic Coke Per Cent.
Silica	46.87	24.06
Iron oxide	15.61	11.54
Alumina	24.12	9.93
Lime	4.21	48.00
Magnesia	1.41	1.15
Sulphur	0.86	0.61
Sulphur as	93.08	95.29
Calcium sulphide	trace	0.53

PHYSICAL TESTS OF BASIC COKE

	Run-of Mine Coke	Basic Coke—12½ Per Cent. Limestone
Shatter test	70.5 per cent.	31.9 per cent.
Porosity	38.8 per cent.	43.9 per cent.
Apparent sp. gr.	0.900	0.934
Real sp. gr.	1.470	1.666

The shatter test is the crucial determination. It is made according to the U. S. Government's specifications, that is, 4 drops of a given quantity of coke at a height of 6 ft. are made and then the broken coke is passed over a 2-in. screen. The percentage passing through is then determined. In the above examples, 70½ per cent. of run-of-mine coke and 31.9 per cent. of basic coke passed through the 2-in. screen. The latter figure is about standard for byproduct coke.

The Possible Advantages of Basic Coke

The porosity and the specific gravity of the basic coke are better than those values for the run-of-mine coke. In fact, we believe it is possible to take an inferior grade of coking coal, and, by the scientific use of crushed limestone in the byproduct process, make A-1 blast-furnace fuel, where otherwise a total failure would result. As before stated, this is due to the formation of a slag binder in the coke. Owing to the strength given by this binder, vast quantities of low-grade or semi-coking coals would be opened up for byproduct use. Whether or not "the game is worth the candle," at present is without the scope of this article.

There might be some advantage to the furnaceman in having limestone added to the coke instead of with it. There are also some natural advantages to the byproduct operator. The total ammonia yield would be increased by the addition of limestone to the coal, and the percentage of fixed ammonia decreased, which would lessen the work of the stills in the indirect or semi-direct processes.

Finally, the main aim in the search for basic coke has been to produce a slag in the fuel which will carry the sulphur with it. But even if this were possible during the coking process, it could not be safely assumed that the sulphur would not get into the iron in passing through the blast furnace just as it does now without the proper safeguards. In fact, we believe the old assumption that calcium sulphide passes through the blast furnace unchanged, is erroneous, and that it would avail nothing from the sulphur standpoint, to have basic coke. Calcium sulphide is stable only at high temperatures and in a reducing atmosphere. As the matter now stands, we think that the sulphur in basic coke would be acted upon by the iron ore in the top of the blast furnace and changed back into its original harmful form ready to be assimilated by the pig iron, unless slagged off as usual, due to the action of the metallic oxides on calcium sulphide (CaS) at comparatively low temperatures.

In view of the foregoing, we conclude: First, that basic coke, in the chemical sense, is not practically feasible, nor wholly desirable; secondly, in the physical sense, it has possibilities in utilizing low-grade semicoking coals for byproduct use.

⁂

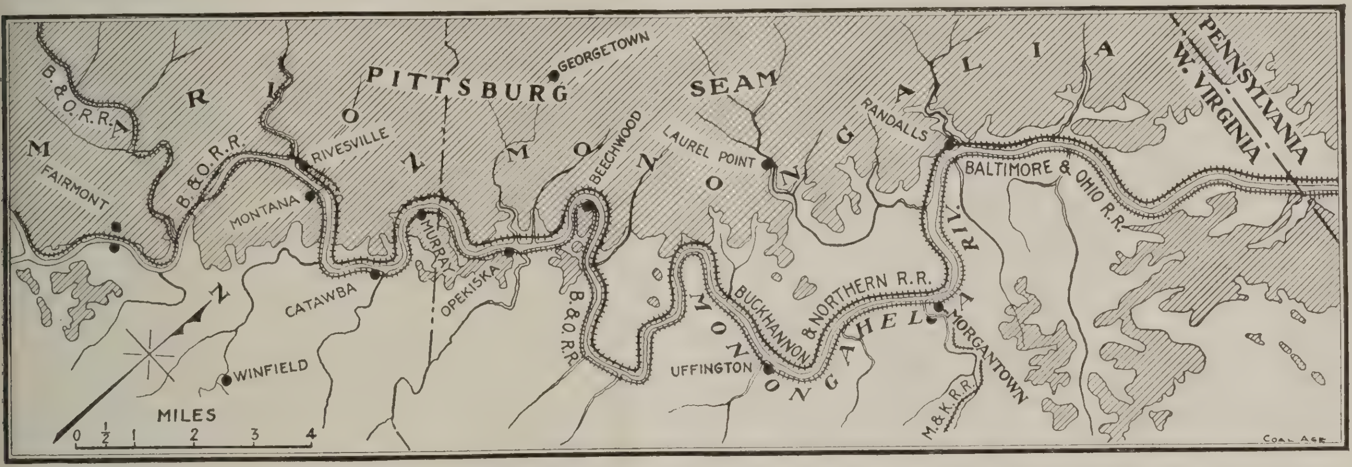
New Freight Rates in Kansas

The Kansas Utilities commission held hearings at Topeka, Kan., during the past week, regarding new freight rates for mine-run coal. This class, under present conditions, takes the lump-coal rate. Consumers advocated that mine-run coal take the slack rate. Operators are against the proposed change almost without exception. Should it be put into effect, slack would be a drug on the market, according to those in touch with the situation. The rate would apply only on shipments in Kansas, even if projected. The commission took the matter under advisement after hearing testimony from all sources and will not announce its decision for some time, according to present indications. Some of the Kansas operators who testified, asserted that the Southeastern Kansas coal field is waning fast. The maximum output, eight million tons annually, will be reached in five years, it was stated. About 6,700,000 tons were mined in 1912.

A New Coal Railroad

The Buckhannon & Northern R.R., now being constructed between Rivesville, W. Va. (five miles north of Fairmont) and the West Virginia-Pennsylvania line, will tap a large area of excellent Pittsburgh coal which has hitherto lain idle, because the Baltimore & Ohio R.R. by some mischance was built on the wrong side of the Monongahela River. As will be seen, without the building of expensive bridges, the road could not tap the Pittsburgh coal bed, except in insignificant areas near Montana, and Opekiska, where there are already mines owned by the Consolidation Coal Co. and the Pittsburg Steam Coal Co. The Upper Freeport and the Lower Kittanning coals can be found on the right or east bank of the river, but they have not been worked along the Baltimore & Ohio R.R. Consequently there is but little activity throughout Monongalia County. The building of the railroad will change this condition and bring a strong competitor into the field.

The Buckhannon & Northern R.R. is being built by the Little Kanawha Syndicate consisting of the Pittsburg & Lake Erie R.R. Co., the Pennsylvania Co., and the Baltimore & Ohio R.R. Co. It will connect at the southern end with the Baltimore & Ohio R.R. and at the northern junction with the Monongahela River R.R., which is owned jointly by the Pennsylvania R.R. Co. and the Pittsburgh & Lake Erie R.R. Co. Thus the coal will find an entry into Pittsburgh.



THE BUCKHANNON & NORTHERN R.R. WHICH WILL OPEN UP THE REGION NORTH OF FAIRMONT, W. VA.

The maximum grades are 0.15 per cent., and several miles are entirely level. The maximum curvature is 8 deg., and as there are only two curves of this sharpness, the maximum severity of curvature may later be reduced to 6 deg. The track is laid with 85-lb. rail, and the work is designed for the heaviest traffic. There are five steel bridges, one a viaduct, 274 ft. long, and another a crossing 290 ft. long, over Indian Creek, opposite Opekiska.

⁂

A Large Modern Breaker

Work is progressing rapidly on the new Loomis colliery of the Delaware, Lackawanna & Western Coal Co., near Nanticoke. Over 40 of the 81 concrete footings for the new breaker are in position, and all the other buildings are practically completed. The hoisting engines at the two main shafts and at No. 1 slope are working, and the coal is being taken to the Bliss breaker, two miles away, for preparation.

The buildings of this colliery, all designed by F. J. Nies, the company's architect, will be the most modern and artistic of any in the anthracite region. They are all built of concrete and brick, except the breaker itself, and are all entirely fireproof. The breaker is to be of concrete up to the pocket line, and of steel and wire glass above. The output of the plant will be about 5000 to 6000 tons daily.

Along the north side of the hill, upon which the colliery is located, are the powder magazine, the wash house for the men, the model barn for the mules, the wire and cement house, the ice house, and the fan house with its two 20-ft. fans. In this building, also, is an air compressor with a capacity of 1500 cu.ft. per minute, which will be used for small hoists in the mines. Two more buildings on the north side of the hill are the supply house and the engine house for No. 1 slope. In the center are the two shaft engine houses. The main shafts at present are 930 ft. deep.

On the south side of the hill is the steam plant with its 135-ft. stack. There are shower baths for the firemen in this building, and blast fans for the furnaces in the basement. The power is now supplied by the temporary plant at the foot of the hill, but the large boiler house will be ready in December. At the foot of the hill also are two pretty double houses, concrete with covered pergolas in front, for the use of the mine foremen.

The breaker, which will also be along the south side of the hill, will be the third in the region to be entirely operated by electricity. The power will be supplied by the company's Nanticoke plant, which also supplies the power for the Truesdale breaker, about two miles away. The equipment of the Loomis breaker as to shakers, spiral separators, sorting tables, rolls and jigs will be modeled largely after that in the Truesdale breaker in that every unit of machinery will be operated by its individual motor.

There will be four shafts in all at this operation. The steel headframes, 80 ft. high, are in place over the two main shafts, each 50.4x14 ft., and these shafts are being operated. The shafts are equipped with gooseneck automatic dumping carriages, which dump the coal upon a bucket-type endless conveyor running from the mouth of the shafts to the breaker.

The third shaft is the old Dundee shaft, abandoned in 1851 on account of the gaseous nature of the mine and the lack of proper ventilating facilities at that time. Coal from this shaft was shipped by boat to Philadelphia. The shaft, which was 10x16 ft., has been filled up to get rid of the water in it, and a caisson will be sunk around it and the shaft enlarged to 14x20 ft. The old shaft was 810 ft. deep, and was sunk to the Ross vein. The fourth shaft will be sunk near the Nanticoke power plant, and the coal from all four will be run into the breaker through the conveyor line.

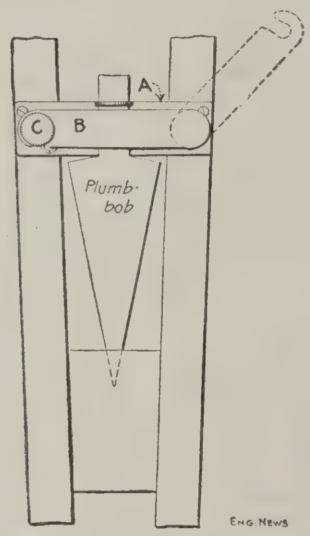
There are 1247 acres in the property, and the buildings with their fireproof construction, resemble a group of college buildings rather than those of a colliery.

⁂

A Plumb-Bob Holder

An ingenious device for carrying a transit plumb-bob is described in a recent issue of *Engineering News* as follows:

> A plumb-bob holder attached to one leg of the transit tripod has been designed by a Canadian surveyor, as a remedy for the plumb-bob getting lost or punching holes in the transitman's pockets. The cut shows the device applied to a split-leg tripod. The point of the plumb-bob rests in a ¼-in. hole bored ½ in. deep in the spacing block of the leg, while its neck fits between two strips of brass. The inner strip, A, is secured by two screws. The outer strip B is hinged at one end, while the other end is notched to hook over a pin C. This pin is fitted as a clamp screw, so that by a slight turn of the milled head the plate is held firmly in place. Both plates are slightly bent at the middle so as to allow for the neck of the plumb-bob and the string which is wound around it.
>
> This contrivance is described in the 1913 "Proceedings" of the Dominion Land Surveyors Association, by F. H. Kitto, Director of Surveys, Dawson, Yukon Territory, Canada. He states that he uses this as the permanent receptacle for the plumb-bob, whether in the field or the office.



PLUMB-BOB HOLDER ON THE LEG OF A TRIPOD

⁂

Vigilance and Co-operation as Factors of Safety

By W. E. Holland*

Believing that the following recommendations, recently made with a view to reducing the number of accidents, both fatal and nonfatal, occurring in the district, to a minimum, would be of value to all engaged in mining, I submit them for consideration and discussion.

The usual custom, at most of the mines operating in this vicinity at the present time, is for one or more company men to pass through the entries at the beginning of each shift, and examine the roof and take down any loose pieces of slate or rock that are found to be unsafe. While this is a good system, as far as it goes, I believe it can be improved. To my mind, the weakest point in the method is that no one is made responsible for any accident that may occur. It has been my chief endeavor to eliminate this weakness and make somebody clearly responsible for the safety of haulage roads and traveling ways throughout the mine.

For the toiler underground, surrounded as he is by dangers seen and unseen, there is never too much protection at the best; and whatever is worth doing in his behalf, is surely worth doing well. In order to reduce to a minimum the accidents that are of such common occurrence and which arise from incomplete or careless inspection or lack of care and caution on the part of the worker, every effort must be made to awaken both employer and employed to recognize their respective individual responsibilities. It is important that they should realize that they must meet on common ground and amalgamate their efforts to avoid the common mine accidents that are of almost daily occurrence.

Reporting Unsafe Conditions

The first recommendation of which I have spoken was to the effect that each company or operator appoint a competent, sober and reliable man, who should go on duty at night shift and make a rigid examination of all the entries and traveling ways throughout the mine. This examination should include the observing of all unsafe conditions of any nature whatsoever, giving particular attention to the security of the roof and coal; and the condition, amount and style of timbering.

The examiner should record in a book, carried for that purpose, each unsafe condition, describing its nature and location. A carbon copy of the report of each examination should be given to the day foreman, whose first duty would be to examine the report and remove or safeguard each of the dangers mentioned. When this has been done the report should be signed by the foreman and sent to the superintendent, for his information.

This system would not only make the mine foreman responsible for the condition of the mine each day; but it would keep the superintendent intelligently informed as to the dangers existing in the mine and would, besides, serve a good purpose as reference, in case of accident. The effect of thus fixing the responsibility for accident, upon each official charged with the work of inspecting the mine or removing the dangers found, would be to increase the degree of caution and efficiency of every mine official. Under such a system, many small details that were formerly disregarded would be given attention.

The second recommendation had reference to a useless practice that has, in the past, contributed so largely to the occurrence of avoidable accidents. I refer to the habit so prevalent among the men and boys employed in the mines, of visiting each other in their respective working places. Not only does this habit result in a loss of time to the workers and, to an extent, reduce the capacity of the mine for putting out coal; but there is a tendency, at such times, for idle loiterers to engage in practices that impair both health and morals. The visiting should be done at the evening fireside, when the day's work is ended.

It should be remembered, in this connection, that when an accident occurs to a man or boy who is out of his place, no one can be held accountable for the same; but the responsibility rests upon the individual alone. There are numerous instances of record where serious injury and even death have resulted from this practice. I would sugst that legislation along this line would help greatly to duce the number of avoidable accidents.

---

*State mine inspector, District No. 1, Albia, Iowa.

The third and last recommendation was to the effect at any employee who knows of an existing danger, ther in his own or in another working place, or on the ad or traveling ways of the mine, shall at once notify e mine foreman, giving its nature and location. Every ine worker should feel his individual responsibility in is regard. The safety of the mine demands this hearty öperation on the part of every worker, in the effort remove every source of danger common to mining.

The old adage: "*Eternal vigilance is the price of fety,*" applies emphatically in coal mining. If there is e place more than another where vigilance is an eternal ecessity, it is in the dismal domain of darkness where e toiler daily and hourly courts disaster and death, order to provide the necessities and comforts of home nd life for those whom he loves and cherishes.

The point I desire to impress most strongly is that esponsibility for safety rests equally on every mine work-r, whether he be official, shifthand, miner or laborer. No ne is exempt, as far as his ability to observe and act ex-ends. Let anyone who enters the mine realize his individual responsibility for the promotion of safety.

⁂

Michigan Mining Interests in Spitzbergen

The Arctic Coal Co., controlled by John M. Longyear, of Marquette, Mich., and associates, has in 1913 shipped 35,000 tons of coal from its mines in Spitzbergen, within the Arctic Circle. The coal has gone to continental ports. The company owns two steamers, one the "Kwasind," of 3800 tons burden, that regularly carries coal in the shipping season, the months of July, August and September, and the "William D. Monroe," a whaler that is used in transporting supplies, but it depends for most of the tonnage it needs on season charters.

It is 10 years since Longyear's attention was first directed to the coal resources of Spitzbergen, and the present stage of the Arctic company's enterprise represents eight years' continuous development, conducted on a constantly increasing scale.

Great sums of money have been spent in the field by Longyear and his associates, and the only returns so far have been the few cargoes sent to civilization. But the region possesses termendous resources in coal, and if all goes well the men interested in the Arctic company will be richly rewarded, both for their daring and the persistence of their efforts to have the international status of Spitzbergen satisfactorily determined.

The shipment of 38,000 tons of coal to southern ports this year was more than has been forwarded in any previous season and more, also, than will likely be forwarded next year, for the shipment was incidental to the development of the property. The stage of actual mining on a commercial basis has not yet been reached. However, the preliminary work has been well advanced and Longyear expects that the company's operations will soon be definitely determined. Much equipment will have to be installed before the property is in readiness for production on a large scale. The general manager is Scott Turner.

A deposit of more than 60,000,000 tons has been indicated by the operations to date. The mines are worked by 250 to 300 men, and, although the shipping season lasts but three months, mining is carried on throughout the year. The geological conditions place no bar on successful mining in the Spitzbergen fields. The beds are uniform to a surprising degree, running about 3½ ft. thick, and the mining problem is simple. The coal is undercut, and drops from the sandstone capping which overlies it. The sandstone makes a stable roof and has to be supported with comparatively little timbering. However, other conditions raise some question as to what part of the coal can be taken out.

The international phase of the matter is one that continues to give concern to the men interested in the company, for Spitzbergen remains No Man's land, and although the Arctic company holds title to its 170 square miles of land by purchase from a Norwegian company, by exploration and by possession, it is regarded as an interloper by the northern nations of Europe, and its rights may not be established without a fight.

In fact, the company's land has already been entered upon by a force of Russians, who have undertaken exploration and who have carried it forward sufficiently so that they have shipped a cargo of coal. What to do about these invaders is only one of the many problems that give concern to the officials of the Arctic company. There is a strong suspicion that they have pursued their course with the knowledge of the Russian government.

Norway has made several attempts to bring together representatives of eight leading nations in a conference in which steps will be taken to determine the status of Spitzbergen, but so far the conference has failed to eventuate. It seems impossible to agree on a time when all the powers are willing to settle down to the task of determining how Spitzbergen shall be governed, or what rights will be respected there.

Our Federal Government Has Given but Small Assurance of Protection

The officials of the Arctic Coal Co. have met with no more success obtaining satisfactory assurances about the backing it will get from the American state department than Norway has encountered in bringing the powers together to deal with the subject. In one of President Taft's messages reference was made to the anomalous condition existing in Spitzbergen, and the necessity of protecting American interests, but so far there has been no more definite declaration that Americans who have made investments in Spitzbergen will be protected by the Government in the final scramble for land and power.

That this is the case is not due to a lack of representations by officers of the company to the state department, but to the reluctance of the officials of that department to act finally on the matter. Longyear has frequently had the matter before the undersecretaries, and recently discussed it with Solicitor General Folk and other officials. This last interview gave Longyear considerable satisfaction and he is hopeful that steps will soon be taken to define the position of the American government in relation to Spitzbergen. With the Russians aggressively in possession of tracts of the company's land, and showing every evidence of a purpose to go ahead and mine coal, this naturally is a matter of great interest to the men who have staked so heavily on the exploitation of the Spitzbergen coal fields.—*Engineering and Mining Journal.*

Meeting of Coal Mining Institute of America

SYNOPSIS—The winter session of the institute was the most successful in its history, and the papers were all of unusual interest. The principal discussions were on the effect of adding foreign bodies to coal before coking, on profits of efficiency and their distribution, and on Rule 18 of the Pennsylvania State mine law.

⁂

The meeting of the Coal Mining Institute of America was called to order by W. E. Fohl, president, at 10 a.m., on Dec. 4, in the assembly room of the Fort Pitt Hotel, Pittsburgh, Penn. The short initial session was entirely taken up by regular business of the less interesting kind. The president declared that he had no address to deliver, so the meeting was soon adjourned.

After lunch the assembly room filled to overflowing and several extra chairs had to be provided for the unusually large attendance. Harrington Emerson's address (see p. 886) entitled "Efficiency in Coal Mining," was most interesting, but perhaps the best feature of his part of the program was his reply to criticisms, in which he digressed slightly from bituminous coal mining in obtaining illustrations of his ideas.

The principal objections were to his argument that strikes are unnecessary, and to the practice of the efficiency experts in bringing all the pressure to bear on the employer and not on the employee. So long as the latter regarded efficiency as a means of making money for the operator, so long will he oppose it. As a matter of fact, the chief gainer in efficiency will be the workingman, but he must not claim the whole gain or there will be no inducement for the operator to sink his money in increased efficiency. On the whole, however, the differences of opinion were rather in expression and emphasis than in real essentials.

Other Speakers

Among those addressing the meeting were C. L. Clark, S. A. Taylor and Thomas L. Lewis, the latter being the ex-president of the United Mine Workers of America.

Clyde G. Brehm, electrician of the Oliver-Snyder Steel Co., Uniontown, Penn., then read his paper on "Safeguarding the Use of Electricity in Mines." This paper appeared in last week's issue of Coal Age. H. H. Clark responded in general approval of the paper. Jesse K. Johnston's paper, entitled "A Study of the Wages and Selling Price of Coal in the Pittsburgh District," will also appear in an early issue. It was exactly described in the title as the author made no attempt to analyze causes or to draw deductions.

After a few complimentary references to E. W. Parker's analysis of the conditions of the coal trade in the bituminous regions (made at the American Mining Congress), there was no further discussion of note. In apparent contradiction of A. J. Moorshead's dictum in Philadelphia, the coal operators did not "just like to talk about their troubles."

The institute banquet was also served in the assembly room. H. M. Wilson, engineer-in-charge of the Bureau of Mines, Pittsburgh, Penn., addressed the meeting on industrial safety. In his speech he claimed for the mining industry the honor of being the source of the widespread movement for the conservation of life. C. L. Fay then made a plea for subscribing memberships at five times the regular yearly rate and found several volunteers. Dr. W. J. Holland, director of the Carnegie Museum, who was erecting a diplodocus in Spain, was unable to be present. Thos. L. Lewis addressed the audience and made quite a favorable impression.

The Question Box

The question box was then opened by John I. Pratt, state mine inspector at Pittsburgh, the first question being: "Should rescue work after mine disasters be performed by men in the employ of the coal operators, or by specially trained corps maintained by the federal or state government? The answer is obvious enough. It would be unfortunate, indeed, if the whole burden of rescue were to be placed on any official body. However, the persons discussing the questions, including J. W. Paul, took up a larger view of the question and discussed the reasons for the continued existence of state and federal rescue corps and the matter of control. In brief it may be said he did not claim or desire any dominating authority for the federal corps. For further details reference may be made to an editorial in this issue on the National Mine Rescue Service. As the question box took up much time, the other questions were reserved for the following morning.

Which Race of People Is Most Subject to Accidents

The first question at the morning session was: "Are accidents more frequent among the foreigners from Italy, Hungary, Poland, etc., than among English-speaking people? As we hope to publish H. I. Smith's reply, it is enough to state that the figures of the West Virginia Department of Mines show the most meager variation between the death risks of natives and foreigners. Unfortunately, West Virginia is probably the only state publishing statistics of the nationality of living and uninjured miners, though nearly all states publish the nationality of those injured fatally or otherwise. Mr. Smith's figures were for one year only and some nationalities, notably the English, are not represented in proportion sufficient to give any exact determination.

The third question evidenced the conviction of the questioner, F. C. Keighley. It is stated as a declaration of principles. It had reference to the injustice of enforcing Rule No. 18 of the Mine Code without considering local conditions. Rule No. 18 refers to the driving of exploratory drill holes 3 ft. ahead of shot holes when approaching clay veins. The old law has the same provisions as the present, but by the omission of a preposition or so, and the change of punctuation, the provision has been totally changed so as to refer to all narrow workings instead of to clay veins in headings.

Exception Is Taken to Attorney General's Ruling

S. A. Taylor took exception to the attorney general's ruling in favor of a drastic interpretation of the law, and pointed out how the wording had been changed without the knowledge of anyone that a modification was intended. He believed the law as originally written was perfectly logical. Clay veins are frequently crevices filled with clay, which crevices extend from the Pittsburgh coal up o the Sewickley and Redstone measures. Large bodies of as are let loose when these crevices are uncovered, and t is best to let these stored-up bodies of gas loose by a mall hole where their escape can be observed and conrolled, rather than to let them be suddenly uncovered by heavy shot. The approach of a clay vein is easily foreasted for the coal gets hard and gnarly. It is wrong to ay the law would be a dead letter if it applied only to lay veins on the ground, and that it was only of force vhen the workings reached an indeterminable point, beause clay veins do give advance warning of their presnce.

F. C. Keighley then presented his case as against the state. His company had not definitely determined to drive up its rooms throughout the mines and let the pillars stand till later, but that was practically its present practice in places. The first recovery was only 15 per cent.; the other 85 per cent. might stay for five or ten years. The pillars left were 90 ft. wide. When he attempted to run crosscuts through these pillars after long exposure to the air on both sides, rule No. 18 was enforced against him. He regarded it an unfair provision. He had clay veins but they were not such as Mr. Taylor described. They were clay rolls in the floor, and they never cut the coal down to a thickness of less than two feet, and never had any leaders passing up to the top of the seam. They could not carry gas, therefore, from other beds.

Mr. Smith explained that the laws were not punctuated till printed in pamphlet form. The punctuation was then added by an editor. The legislature had nothing to do with periods, colons, semicolons and commas.

Election of Officers

Three other questions which were to have been discussed were ruled out by the chair for lack of time. The elections then took place, and the following were elected for the coming year:

President, J. K. Johnston, general mine superintendent of the Pittsburgh Plate Glass Co., Creighton, Penn.; 1st vice-president, W. Seddon, Brownsville, Penn.; 2nd vice-president, A. P. Cameron, superintendent of the Westmoreland Coal Co., Irwin, Penn.; 3rd vice-president, I. G. Roby, state mine inspector, of Uniontown, Penn.; secretary-treasurer, C. L. Fay, Wilkes-Barre, Penn.

G. A. Burrell then read a paper on the "Relative Effect on Men and Small Animals of Small Amounts of Carbon Monoxide." This will be reproduced in an early issue, so it is only necessary to say that Mr. Burrell's statement that opinions differed as to what were injurious doses of monoxide was fully borne out in the discussion. We hope some time that Mr. Burrell will answer W. J. Price's question as to the manner in which the Bureau compensates for the changes produced by a large animal or man on the percentage of vitiated air in the atmosphere of the test chamber. In some manner this question was overlooked.

Papers on Coke

The article on "Basic Coke" (see page 894), by J. R. Campbell, chief chemist of the H. C. Frick Coke Co., followed and was discussed after lunch, as was also the paper of F. C. Keighley on "What is the Proper Method of Sampling the Beehive Coke Oven for Analysis" (see page 890). It may be noted that by basic coke is meant coke in which the alkali bodies exceed the acid bodies in the coke substance. There is another definition used in the trade. This declares basic coke to be coke which is too high in phosphorus to be used in a bessemer converter. The name "high-phos coke" is sometimes used for fuel of this description.

Mesabi Ore Was Mixed with Powdered Coal, but Result Was a Failure

Mr. Keighley stated that he had mixed 10 per cent. of Mesabi ore with powdered coal and obtained a strong coke, closely resembling the ordinary run-of-mine variety, though it rusted somewhat badly when watered. The manufacturers wanted to offset the dustiness of the ore by introducing it into the furnace as part of the coke charge, but 10 per cent. was regarded as being too small a proportion so it was raised gradually to 20 per cent. The result was a failure, as the final product was a fluxed material of no possible value as coke. Later attempts were made to use breeze in the oven charge, but the results were not encouraging.

J. L. Sherrick declared that 2600 deg. of temperature were necessary for the lime to form a slag in the coke, and he could not see how that action could take place in the byproduct oven where the heat was insufficient. E. B. Wilson discussed the addition of sodium chloride to the coal. This, J. R. Campbell stated he had tested and was full of hope that it would solve the problem. However, as the product ammonium chloride instead of ammonia was formed, the indirect process of producing sulphate of ammonium had to be adopted. This made the addition of common salt to the coal undesirable.

E. W. Parker asked F. C. Keighley if the coal was crushed before coking in the Connellsville region, and the latter stated that one concern had crushed and washed its coal and found the percentage of sulphur increased over uncrushed and washed coal. They found they obtained better results by cracking the coal. By not producing so fine a powder, the flake "sulphur" could be separated. When crushed, this "sulphur" became fine and could not be removed from the coal. He believed this flake "sulphur" came from solutions which descended through the roof. It was his experience that coal was higher in sulphur when found under a sandstone roof, which is permeable, and lower in sulphur when under a close shale roof.

W. F. Elwood neither came nor sent his paper on "Stray Electric Currents," and the meeting proceeded to W. R. Crane's interesting address on the "Coal-Mining Fields and Transportation Problems in Alaska." The address on "Portable Electric Mine Lamps," by H. H. Clark, interested and pleased the audience, but did not draw out much discussion.

Finally with the nomination of a committee on electrical affairs to discuss the adoption of standards for electric mine lamps, the meeting closed. The committee thus formed consists of C. A. Means, electrical engineer to the Department of Mines; R. N. Hosler, chief engineer of the Rochester & Pittsburgh Coal & Iron Co., and H. T. Booker of Monongahela, Penn.

⁂

Asphalt residue from petroleum and water-gas, tar and pitch in large percentages are the best briquette binders for lignites that are caked by fire. Starch, magnesia and sulphite liquor are the best for noncaking lignites. With grates constructed so as to hold the fire together, lignite briquettes without any binder give good results.

The Necessity of Organization

By Thomas L. Lewis

SYNOPSIS—Mine labor is about as efficient today as it was several years ago. By organization the miner has given stability to the industry. Disputes between operators and labor unions could be advantageously and peaceably settled and the operators otherwise greatly benefited if they were as strongly and thoroughly bound together as are the miners.

⁂

I was much interested in the paper read by Mr. Emerson. To discuss every phase of this question would take more time than could be allotted to it this afternoon. There were so many facts stated in that address that every man in this audience, young and old, ought to be not only willing but anxious to express his opinion either for or against what was said.

I have no criticism to make of his position with reference to efficiency. If I were to presume to criticize any part of the address of Mr. Emerson it would be that part referring to the cost of producing a ton of coal. Not that the statements as made are incorrect, but a wrong impression will go out to the American people as to what it actually costs to produce a ton of coal in this country, and it will make it much more difficult to get a fair price for a unit of output.

The trouble with the coal industry is that fuel in this country is being produced at such a figure that at the present selling price the consumer is demanding that we give the product to him for nothing, notwithstanding the fact that we are exhausting a valuable resource. Nobody seems to be interested except to get a ton of coal at such a price that there is practically nothing in it for the producer. I know of a number of corporations in this country who are charged right and left with bleeding the public on the one hand and robbing the workingmen on the other, and yet, with the most efficient appliances they can get, they are on the verge of bankruptcy. This is the usual condition with coal companies.

Labor Is Not Much Changed

However, I am not going to agree with my friend on the left that the labor of today in the mines is much different from what it was 25 or 30 years ago. I worked in the mines 35 years ago, when the dominant, or the predominant mine workers were the British, the French and the German people. And when I say British, I mean the Irish, Scotch, English and Welsh. They in their line were neither better nor worse miners than those of today. It is now a question of having competent men, in most instances who know how to operate a machine to cut coal. At that time it required skill, muscle and brain power, because we had to mine it all, shear it and block it down without the use of an ounce of powder. But we have got away from that today. We now recognize that there is no necessity for that method. If proper time is taken and proper effort is made and intelligent methods used, we can produce a better grade of coal under our present system, with machine mining, than we could under the old system with pick mining, wedge and sledge.

I believe the gentleman on the right—and I am diverging now possibly from Mr. Emerson's paper—at least indirectly, where he takes the position that what we need today is to get to the operative. Rather get to the mine workers in this country. Let me ask you this: How much time is taken by the mine managements, by the operators, by the institutes of this character—and you are doing a splendid work—to impress the ideas that are brought forth here back upon the minds of the men who swing the pick and the shovel? How much space will the public press in the great city of Pittsburgh devote in the columns of their papers to the elaboration of the splendid ideas you men bring forth in this Institute? The chances are that tomorrow morning you will pick up a daily paper and see about two or three or maybe four inches of space buried back among the advertisements. Why? If we want to find out why we cannot make our people more efficient, more progressive, more determined to lift the coal industry to a higher standard, let us go back—and I am going to talk from an operating standpoint, though I am not an operator—and ask ourselves as operators how much time we have devoted to the work of efficiency as applied to getting to the mine workers?

That is where we are lost. We understand those questions here. We can discuss them here from our standpoint. We know what the remedy is. But there are nearly 800,000 mine workers in this country, of every nationality under the sun, who have not the faintest conception of what is meant by raising the standard of efficiency of labor. And we must reach those people.

Now as far as the nationality or class or kind of people is concerned, working in the mines, what do we find? Why has the Italian developed into an objectionable laborer in the mine? Not because he is any less strong than his fellow worker of some other nationality; not because he is not disposed to learn to swing a shovel just as quickly; not because of his inability to learn any other kind of work in and around a mine. But because by nature he is impulsive and much more easily appealed to through his prejudices and his passions than the other nationalities are. The result is that he is more apt to resort to things that we term un-American. They cannot conceive of a system where they ought to be subordinated to the will of law, where they ought to conform to our general ideas of Americanism, and the result is that in every industrial struggle in this country we find the Italian more apt to resort to the old Feudalistic system of force than to permit himself to be appealed to in reason or intelligence.

That is generally true of the Italian. It applies to certain other nationalities, though probably not to the same extent. And we find, as stated by Mr. Emerson, that strikes are a deplorable, and in my opinion a ridiculous, proposition. Why do we have strikes? On one side we have an organization of mine workers which has sought to improve the conditions of their membership. We find that by insisting upon being paid certain rates of wages for their labor they have given more or less stability to the coal industry. That is a matter that is subject to proof. Back in 1896 and 1897 the average operating company in this country was on the verge of bankruptcy; the average miner in this country was on the verge of

---

Note—Impromptu address before Coal Mining Institute of America, Pittsburgh, Penn., Dec. 4, 1913.

starvation, and when he worked steady every day he could not meet his honest obligations. Why? Because of a disorganized condition existing between the mine workers and the mine operators. A mine operator is not seriously opposed to his employees organizing, because he feels that it is going to help him. But the trouble has been that the operators have been inefficient in not learning the lesson of united effort. If they had learned that, they would have been organized all over this country and they would then have been in a position to say to the mine workers, "We will go along as far as it is right, just that far and no farther."

The Remedy for Petty Strikes Which Are Now Becoming Frequent

And we find another condition developing. The other condition is what I call stand-pat, local strikes in violation of contracts now in existence. Now what is the remedy for that? First it is up to you to get together and say, "If we are going to have contracts we are going to live up to them, and we are going to make the other fellow live up to them." It sounds harsh, but we live in an age of organization. Our very country is founded upon it, and we might as well attempt to empty the water out of the ocean into space as to try to disorganize any form of organization in this country.

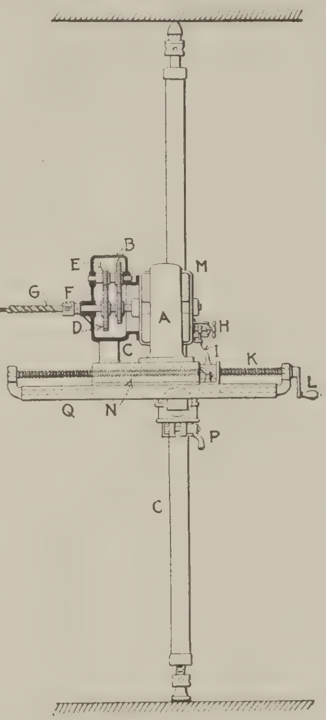
What we want to do is to make every mining organization a lawful and a legal organization, with a fixed purpose, and that fixed purpose the uplift of the mining industry. First, because we are selfish enough to believe that our own interest begins with the mining industry when we are connected with it, and then we are willing to help uplift the whole country. But with 750,000 miners, and, counting operators, mine bosses, fire bosses, weigh bosses, as well as the operating managers of the different corporations I would not be far wrong in saying at least 75,000 more, every one of them supposed to be an unusually intelligent man to hold his position, what influence do they wield? I know I am talking plainly, but that is my weakness. I realize that if the operators of this country will organize as they should do, you could begin talking efficiency with effectiveness. You could say to us fellows in joint convention, "We believe you are entitled to certain things for your labor, and we are entitled to certain considerations in the operating and developing of our properties and we are going to have them." Intelligence would compel both sides to come together on reasonable grounds, and I think strikes would be a thing of the past in the mining industry of this country.

I hope no one will take offense if I have been too plain spoken expressing these few rambling ideas. I always invite criticism of whatever I have to say myself, and I always reserve the right to criticize anyone else—not the individual, but his method of doing business and his action. At first I did not know that I was to have the privilege and the honor and pleasure of coming here and listening to a discussion on such a vital subject, especially to the coal industry. I am glad I was able to come, because I have learned a great deal and I expect to go away from here having learned a great deal more, even though my time is limited. And I want to thank the Institute, therefore, for the privilege and the honor of being permitted to address this assembly and express a few thoughts.

Recent German Drilling Practice

From an article on Prussian mining practice during the year 1912, in the "Zeitschrift für das Berg- Hütten- und Salinenwesen," the following information is obtained:

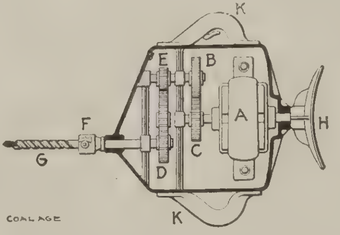
At the Bismarck mine of the Königsgrube in the Königshütte district, trials have been made with electrically driven column drills, as shown in Fig. 1. A three-phase-current motor *A* of one horsepower and 120 volts, drives, through the gearing *B, C, D, E,* the drilling head *F* in which is seated the twist drill *G*. By turning the handle *H,* which is seated on an eccentric shaft, through 180 deg. the feed nut *I* engages or is released from the feedscrew *K*. This screw is turned by the feed crank *L,* which causes the nut *I* to move the housing *M* forward or backward on the slide *N*. The drilling machine is mounted on a double-screw column *O* by clamp *P*. The drill entire was furnished by the Schlesische Gruben und Hüttenbedarf G. m. b. H., of Kattowitz, its price being about $600.



The Siemens-Schuckert Works build a machine resembling it which does not contain the slide *N*, but is equipped with a closed nut on the feedscrew and an automatic feed.

Electric Hand Drills

The experiments with the above machines have been successful, but the adoption of post electric drills has been limited by the new electric hand-drillers which have been placed on the market by the same firms. In these the design of which is fundamentally like that of the column machines, a three-phase motor of a half horsepower using current at 120 volts and 50 cycles is used. It operates through the gearing *B, C, D, E* and the boring head *F* in which is placed the twist drill *G,* Fig. 2. The drill is fed by the pressure of the workman against the breast plate *H* and the switch is placed in the handle of the machine *K*. The weight of the entire drill is about 24 lb.



Two Electric Drills in Use in German Mines

The output of a single machine in coal is equal to that of good hand-hammer drills. It turns out a coarse drill dust. This is an important matter because of the dangers of fine coal. A further advantage, particularly in pillar work, is the almost noiseless operation of the machine. Few repairs have been found necessary so far. As to the economy of the drills, a judgment can only be formed after longer service. It is, however, to be assumed that, in spite of their higher purchase price (which is with appurtenances about $225 each) they will be found cheaper in service than hand-hammer drills because it is less expensive to transmit electricity than compressed air and less power is required than with a pneumatic drill. The exhaust does not furnish ventilation and the drills are unsuited for operation in rock but otherwise they are as available for drilling as hand-hammer drills. They are being used successfully in other mines besides those named.

Winter Meeting of the West Virginia Coal Mining Institute

The meeting of the West Virginia Coal Mining Institute followed the schedule on Monday exactly, except in the matter of the address of Fred C. Keighley, who did not put in an appearance.

On Tuesday morning E. N. Zern made an excellent report on the membership of the institute and on the means whereby that membership can be increased. All the officers of the previous year were reëlected unanimously, which perhaps was unfortunate as one, J. F. Healy, has moved recently from Elkins, W. Va., to Utah.

The officers elected were: President, Neil Robinson, Charleston, W. Va.: Vice-presidents: George T. Watson, vice-president Consolidation Coal Co., Fairmont, W. Va.; John Laing, coal operator, Charleston, W. Va.; R. S. Ord, general manager, Elkhorn Coal & Coke Co., Maybeury, W. Va.: J. F. Healy, general manager, 1240 E. South Temple St., Salt Lake City, Utah.; J. C. McKinley, coal operator, Wheeling, W. Va.; secretary-treasurer, E. N. Zern, professor of mining engineering, Morgantown, W. Va.

Frank Haas was delayed by a freight wreck at Parkersburg, W. Va., and telegraphed that he could not arrive till 5 o'clock, and, therefore, would not come at all. His paper was not read.

J. W. Hunt read a paper on "Overcutting Machines," to replace an address on "Continuous Cutting Machines," by John S. Walker, Jr. This was followed by a discussion on mining education by I. D. Shaw, secretary of the Industrial Department of the International Committee of the Y. M. C. A., New York City.

In this discussion, D. C. Kennedy, E. B. Wilson, R. A. Colter, C. R. Jones, W. H. Grady, J. E. Beebe and R. D. Hall participated. The discussion covered every ground from most elementary education to preparatory teaching for mine foremen and firebosses. Mr. Jones spoke relative to the work of the University and his hope that it may be extended to the various mining towns. He also referred to the bill for congressional aid of mining schools, and in the afternoon a resolution strongly supporting this bill was unanimously adopted.

E. W. Parker suggested that Neil Robinson, who is also president of the West Virginia Coal Operators' Association, endeavor to interest them in the success of the institute. In the afternoon this was also made the subject of a resolution.

In the afternoon R. A. Colter read his paper on the "Selling Prices of Coal," and J. F. Callbreath, secretary-treasurer of the American Mining Congress, and Carl Scholz, president of the same and a former mine official in West Virginia, addressed the meeting on the purposes of the congress. An article on "Pocahontas Mining Methods" was then read by W. H. Grady, of Bluefield, W. Va. John Laing spoke on the Department of Mines.

The discussions, except during the morning session, were somewhat short. If greater encouragement had been given, more would have been said. In fact, several persons had prepared written discussions of Mr. Grady's paper, but were somewhat slow in rising to their feet. Neil Robinson's ability to say the right thing at the correct time with grace, clarity and force was generally remarked, but some wished that he had given a little more place to discussion. There is perhaps not a mining institute in the country with as accomplished a speaker as Neil Robinson occupying the position of president.

The Largest Mine Hoist in America

The North Butte Mining Co. recently awarded the contract for a new electric hoist to the Westinghouse Electric & Mfg. Co. This machine will be installed on the new Granite Mountain shaft of the above named company and it is believed that it will be the largest electric mine hoist in America.

The hoisting drums will be 12 ft. in diameter and direct connected to an electric motor driven from a motor-generator set at a speed of 71 r.p.m. The motor-generator set will be equipped with a 50-ton flywheel to secure elimination of the peak, incident to the period of starting and acceleration.

Skips will be hoisted, each containing 7 tons, by a rope 1⅝ in. in diameter, at a normal rope speed of 2700 ft. per min. with a maximum of 3000 ft. per min. The capacity of the hoist is such as to permit 300 tons per hour being raised from the 2000 ft. level or 200 tons per hour from the 4000-ft. level.

The motor will be of the type used in steel mills and will consequently be of extremely heavy construction. All the equipment has been designed with absolute reliability as the paramount consideration. A number of special safety devices are included in the equipment, among which are electrically released brakes, automatic slow-down devices to prevent the skip or cage ever going through the head sheaves and a special controller to limit the speed when hoisting men. The installation furthermore is so designed that the draft of power from the power line will be practically constant throughout any hoisting cycle.

The Production of the Mines

According to the figures prepared by the Geological Survey the total mineral production of the United States in 1912 aggregated $2,243,630,326, or about six times the value of the output in 1882. During that time the population has about doubled but the per capita output of the mines has increased from $7.27 to $23.47. Values of pig iron increased from $106,000,000 to $420,000,000; copper from $16,000,000 to $205,000,000; gold from $32,000,000 to $93,000,000; lead from $12,000,000 to $37,000,000; zinc from $146,000,000 to $650,000,000. The value of coal produced in 1912 was about double the total mineral output of 1882. In 1880 the average value of mineral products was about $1,000,000 a day, but in 1912 it was over $6,000,000 a day. The figures given are the latest official estimate issued by the survey.

EDITORIALS

The National Rescue Service

The problem arose in the question box at the recent session of the Coal Mining Institute of America whether the operator, the state inspectorate and rescue forces, or the federal rescue service should take the lead in mine disasters.

The members of the Bureau of Mines frankly admitted that the local forces had a considerable advantage over the corps of the government on their earlier arrival at the mine opening and in their greater knowledge of the conditions in the mines. This, of course, cannot be questioned, although a knowledge of the nature of the explosions occurring in other mines and of the tactics used in other places is no small advantage; for good generalship in war commonly exceeds in value any mere local knowledge of the roads, streams, hills and forage, in the tactical field.

Perhaps the most remarkable feature in the discussion was the readiness of both the state corps and the Federal Bureau of Mines to coöperate as to the need of indefinite continuation of official rescue work. Retirement from any line of effort is not a common practice of those who are employed by state and nation. Self-perpetuation is more usually the chief aim of such bodies, regardless of public advantage. We are glad that the Bureau of Mines and the Illinois officials are exceptions to that rule.

It was pointed out that the burden placed on the operators of Illinois, following the "Cherry" mine disaster had put them at a considerable disadvantage in respect to coal-mining corporations in competing states, and so the legislators, feeling that the discrimination arising from state lines would work undue hardship on the industry in Illinois, argued that, at least temporarily, it was well to relieve the operators in their state of the obvious necessity of providing rescue apparatus for mine recovery. That need will not be adequately met till there is rescue apparatus at every mine or group of mines.

The members felt that ultimately such protection would be demanded, and thought that the need of it was already powerfully exemplified by the fact that some of the operators were providing such apparatus and training stations at their mines before there was any legal compulsion.

Like them, we cannot but feel that the need for state or government stations, or both, will entirely pass away with the progress of corporational activity in this line. Even if every company should, at some future time, have its own corps or should participate in providing the services and equipment of some central rescue body, still there would be need for men of experience in actual rescue and fire-fighting work, just as there is need for a standing army in a nation, despite the readiness and eagerness of volunteers.

There is no lack of bravery among miners. That fact has been evidenced again and again, and perhaps it hardly needed the earnest expression of its truth delivered by E. W. Parker. Such appreciations are necessary, however, because the work of bravery should never pass without its laurel.

But in actual service, it has been observed occasionally, that the readiness of miners to jeopardize their lives, after disasters, was not always so evident when they were asked to depend on the mercies of a rescue apparatus, which perhaps they had never worn before or which they had never used in actual mine-rescue work. They prefer to face a greater certainty of death with the natural unencumbered use of their limbs and lungs. To recall an old story, they do not essay to go out to battle in armor they have never tried. Furthermore, it is better they should not if more experienced men are obtainable.

Many a mine explosion kills off most of the trained men and as the rescue work must be done either in apparatus or in fresh air, the miners usually declare for the latter. There is in some regions a preference for this fresh-air work, because in such localities, mine fires and secondary explosions do not usually supervene. However, in the greater part of the United States, the risk of adding to the death roll by these methods cannot be overlooked. The mysterious second explosion at Brookside shows that even in the anthracite region a violent explosion may follow the first blast, though it would be a mistake to declare, in view of the peculiar circumstances and undetermined causes, that this second disaster would not have occurred had the fan been stopped while an exploration was made by men with breathing apparatus.

Because of the frequency of second explosions, the advocates of fresh-air rescue work must expect their claims to be disputed and disproved in most of our coal districts.

That being so, before we desire to sweep away federal and state institutions for mine-rescue work, we shall have to assume that at all disasters, men will be found ready not only to enter the mines but to put on breathing apparatus. There will always be men at every mine who will take a chance to save a comrade, and this statement will apply without contradiction, to every body of mine workers from Pennsylvania to Oregon and from Illinois to Texas. However, it is a fact that at some disasters, the local rescue men begin to wonder, when the time comes, whether their apparatus is in perfect condition, and they are prone to doubt whether the natural respiration can be advantageously supplemented by a mechanical contrivance.

Wales has numberless brave men and it has several excellent rescue stations with automobile rescue trucks. Yet at Senghenydd, the rescue work was done in fresh air by men trained in the use of breathing appliances and by others. The apparatus was not worn, at least in the bulk of the recovery work, yet that mine was the logical place to use them for the coal caught fire in several places.

No second explosion resulted, such as occurred at the Cadeby Main colliery, but the risks were there and dangers are inseparable from such methods in mines which are gaseous, or where mine fires have been started and are ready to blaze up as soon as the air is renewed.

It is when there is a lack of local helmet men that regulars are needed who can rely on their breathing appliances, on their ability to wear them and who can be depended on to pass rightly on the condition of such apparatus as they find at the mine. As was remarked, "there is always a risk that some corporation driven by the law to buy appliances, will thrust them into some dark corner and leave them without proper attention, giving the men who should use them no training in their use."

This fact makes it probable that the rescue cars of state and nation are here to stay, though possibly they may in time serve only a secondary though quite a necessary line of defense.

⁂

Market Charts

Many students of economics assert that the trend of business and industrial activity moves in certain prescribed cycles. They maintain that the pendulum swings from a high to a low point at more or less well defined intervals. If this be true in a general way, then the same principle is of interest when applied to the coal markets, which are subject to annual seasonal fluctuations.

With this thought in mind, Coal Age has devised a series of original charts for showing graphically, and at a glance, the exact status of the different conditions which combine to fix the market price of coal. The charts have been tested out for a number of months and have been so well received that it has been decided to increase their general scope and furnish those who are interested, with enlarged reproductions, suitable for wall charts.

There are three controlling influences which go to make the coal markets and for which exact and reliable figures are available. These are the temperature, the comparative price level, and the supply of railroad equipment. The last named condition enters into the problem only once during the year, as a rule; that is, in the fall, when forehanded consumers start laying in their winter's supply of coal and operations all over the country are being tuned up to full capacity.

Coincident with this condition of increased activity, the crop movement starts up in full blast and the railroads are soon facing the maximum load of the year. If, then, at this time of unusual transportation demands, a period of inclement weather sets in, interfering with the movement of trains, the situation often becomes acute and the market hinges entirely on car supply. To cover this phase closely, we publish a detailed statement of transportation conditions in all sections of the country, and also a chart which shows at a glance the exact condition of the gross car supply for the present year and the 12 months preceding. It should be noted in this connection that this is the only statement of this kind now published and confined entirely to the coal-car supply.

The close of the year of 1913 finds the coal trade facing what is commonly termed a "weather market." Complaints are general in all parts of the country regarding the abnormally mild temperature and, as a consequence, what had promised to be a buoyant fall trade, really developed into a situation where summer prices could scarcely be maintained. It might be argued in this connection that the difference in consumption between a severe and a mild winter is too meager to influence the market, and it is true that a competent authority in New York places the differential in consumption between a severe and easy winter at only 10 per cent.

However, it must be remembered that the difference is not only one of consumption, but of production and movement as well. Operations at the mines are often interfered with by adverse climatic conditions and, as is well known, the efficiency of the railroad service is always seriously crippled at such times, so that weather conditions become a prime factor in the situation. This is, therefore, an important consideration, and we are accordingly publishing charts, at intervals, showing the comparative mean weekly temperatures at three representative distributing centers, and three more will be added shortly.

The relative condition of the market as regards prices is also an important consideration when studying the current status of the trade. The competent sales agent, watching the trend of business closely, carries a well defined synopsis of the situation over the past year or two in his mind's eye, and is continually balancing present conditions against those in effect at the same time last year.

He knows that at a certain time in the fall, an advance in the prompt market may be reasonably expected and that a decline some time in the spring must inevitably follow. The exact time and range of these price variations are, as a rule, only vaguely fixed in his mind and are more or less subject to the vagaries of the human equation. To overcome this difficulty, we have compiled charts showing the comparative prices for the past two years, according to weekly quotations in Coal Age.

This data is of value principally in a comparative sense, and not for the actual figures quoted. Unlike other commodities, the price of coal is subject to so many varying conditions that no standard quotations are available, but the figures given are standard in a comparative sense, since they are quoted under indentically the same conditions and by the same men. We believe them to be representative of a conservative market in every sense of the word, since they are fixed in an entirely impartial and unbiased manner.

⁂

The Scranton Situation

The present status of the mine-cave question in Scranton is proving no exception to the experience of the past, that time always temporizes men's feelings and hearts. Time amalgamates human interests.

The wisdom of the seeming indifference of the great coal corporations, whose capital and energy have coöperated to develop the natural resources of the city and its suburbs, is now beginning to appear to the progressive citizens of Scranton. The skies are brightening with the coming of the new year, which it is hoped will mark the dawn of a new era of prosperity for the anthracite city.

Mayor-elect Jermyn is a man whose precedents emiently qualify him to head the committee that will discuss with President Truesdale the interests of Scranton and her citizens.

Recent Legal Decisions

Assumption of Risk by Miner—A coal mine owner is not liable for injury to a miner caused by a falling rock, where the miner himself tested the rock before knocking a prop from under it, which action permitted it to fall. (Alabama Supreme Court, Adams vs. Corona Coal & Iron Co., 62 Southern Reporter 536.)

Avoidance of Settlement Made by Administrator—A settlement made by a miner's administrator of a claim of damages against the decendent's employer, arising from his death while at work, may be avoided by a beneficiary of the estate if it appears that the settlement was unfair (Kentucky Court of Appeals, New Bell Jellico Coal Company vs. Stewart's Administratrix, 159 Southwestern Reporter 962.)

When More Than One Certified Foreman Must Be Employed in Pennsylvania—The Pennsylvania Anthracite Mining Law requires a certified mine foreman to be placed in charge of each separate mine operated by a single company; it is not sufficient, when one company owns two disconnected mines, that an assistant foreman be placed in charge of one of them. (Pennsylvania Supreme Court, Janosky vs. Lehigh Valley Coal Co., 88 Atlantic Reporter 419.)

Employer's Liability—Measure of Damages—A miner injured while being lowered to his place of work, through a defect in the engine controlling movement of the cage, is entitled to recover such amount, as damages, as will presently compensate him for his past and future physical pain and loss of time, or diminished earning capacity, resulting from the accident. (Texas Court of Civil Appeals, Texas & Pacific Coal Co. vs. Choate, 159 Southwestern Reporter 1058.)

Accumulation of Coal on Track as "Dangerous Condition"—Accumulation of coal on a mine track, caused by its being raked off the cars on account of lowness of the roof of the entry, in such quantities as to cause derailment of the cars, is such "dangerous condition" as the law of Illinois requires the mine owner to guard against. Such law is not unconstitutional as constituting class legislation, since it applies to all mines similarly situated. (Illinois Supreme Court, Mengelkamp vs. Consolidated Coal Co., 102 Northeastern Reporter 756.)

Duty to Warn Mine Employee Against Danger—Although, in a suit against a coal company for injury to an employee, sustained while attending a winch wheel by having his arm caught between the wheel and a nearby steel bar, the question whether the employer was negligent in failing to give notice to the employee of the starting of the engine which operated the wheel is not to be determined by any custom of the employer to give or not to give such notice, it was not necessarily negligent to fail to give the notice, where the winch line was taut and the machinery was being operated; the injured employee not being a novice in the work. (Kentucky Court of Appeals, West Kentucky Coal Co. vs. Kelley, 159 Southwestern Reporter 1152.)

Responsibility for Company Physician's Negligence or Malpractice—Before a coal mining company will be held legally responsible for negligence or malpractice of a physician employed by it to treat its employees, it must appear that the company was negligent in selecting or retaining him. But if an employee has as full knowledge of the physician's incompetency as the employer and yet fails to complain against his retention by the company, the employee cannot recover against the employer on account of any damage resulting from negligent treatment at the doctor's hands. (West Virginia Supreme Court of Appeals, Guy vs. Lanark Fuel Co., 79 Southeastern Reporter 941.)

Liability for Injury to Miner—A verdict for $1250 was not excessive recovery against a coal mining company for physical suffering of a miner, preceding his death, resulting from his being crushed between a car on which he was riding and a prop set near the track, where the jury found that the company negligently failed to maintain the place in a reasonably safe condition. The jury were properly instructed that the company was not required to furnish an absolutely safe place of work, but that it was bound to use ordinary care to make the place reasonably safe; and that if the accident was caused by negligence in this respect, while the injured miner was in the exercise of ordinary care for his own safety, his administrator was entitled to recover (Kentucky Court of Appeals, West Kentucky Coal Company vs. Butler's Administrator, 159 Southwestern Reporter 958.)

Right to Enjoin Operation of Coal Washery—Suit will lie to enjoin operation of a business in such way as to injure the public health or comfort as where smoke or gas is emitted in offensive quantities. In determining what constitutes a nuisance of this kind, the particular surrounding circumstances must be taken into consideration, including the density of population, the character of the neighborhood as to occupancy for residential purposes, etc. But in this case, a suit to enjoin practices at defendant's coal washery, it was decided that the evidence was insufficient to show that a slack pile, smoldering from spontaneous combustion and emitting smoke and gas, constituted a nuisance, or that there was any public nuisance arising from the fact that water from the plant was cast into open drains. (Illinois Supreme Court, City of Pana vs. Central Washed Coal Co., 102 Northeastern Reporter 992.)

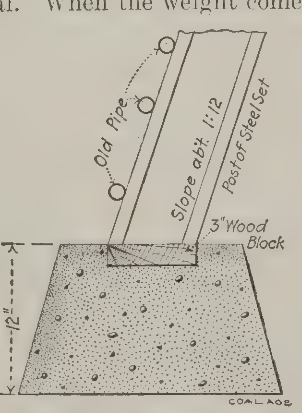
Illinois Safety Requirements—A miner who is injured while working under dangerous conditions, pursuant to orders from his superior, is entitled to recover the amount of his damage from his employer, if he used due care for his own safety, and the danger was not so obvious that a reasonable person would not have undertaken work in similar circumstances. Direction by an assistant mine manager, after inspecting a mine roof, to a miner to proceed with his work constitutes implied assurance that the roof is safe. The clause of the Illinois mining law which makes it unlawful for a miner to commence work without examining the roof over him, and until any dangerous condition has been obviated, except to make the place safe, applies only to miners who have fixed working places, and not to men who work all over the mine wherever fall of material from roofs may occur. (Illinois Supreme Court, Grannon vs. Douk Bros. Coal & Coke Co., 102 Northeastern Reporter 769.)

Railway Company's Liability for Failure to Furnish Cars—Although a statute in force in Kentucky requires railway companies to furnish cars to shippers on demand, the employees of a coal company cannot maintain suit to recover for loss of work, caused by a railway company's wrongful refusal to furnish cars to the coal company. (Kentucky Court of Appeals, Illinois Central Railroad Co. vs. Baker, 159 Southwestern Reporter 1169. The court said: "It may be true that this statute imposes upon the carrier the duty required for the benefit, in part, of the public, but the statute only becomes operative when some person having a contractual relation with the carrier has been injured by the breach of duty, and the right of recovery is confined to such person. In other words, the statutory duty, to be the basis of an action, under circumstances like those we are considering, must rest on a contract, expressed or implied, made between the complaining party and the carrier."

⁂

Some Susquehanna Methods

In using steel timber sets the Susquehanna Coal Co. at Nanticoke builds concrete bases for its posts but, in order not to render the support too unyielding, a wood block 3 in. thick is placed in the top of the concrete pedestal. When the weight comes on this wood filler it is often crushed till but 1 in. through. This takes up those changes in relative elevation of top and floor, which always take place on the commencement of mining. The lagging over and alongside the timber sets is usually of scrap pipe and when enough of this material is not obtainable, it is purchased elsewhere. Of course, this pipe lagging is supplemented in various ways by cross-lagging of rock or wood. The pressure is not sufficient to crush the pipe.



FOOTING FOR STEEL POST IN MINE SET

The Susquehanna Coal Co., on breasts at pitches varying from 10 deg. to 20 deg., is using concrete batteries built 2 ft. thick and 12 ft. wide, and they are giving perfect satisfaction. As a rule the breasts are only 4 yd. wide at the gangway and are not enlarged to 30 ft. till they are about 24 ft. long. But conditions are not quite uniform and some variation in practice is allowed.

DISCUSSION BY READERS

Working Coal under Sandstone Cover

Letter No. 4—I offer the following, in the hope that the suggestions may help W. N. Anderson and West Virginia Engineer, in the difficulties they described, Coal Age, Nov. 15, p. 745.

The chief difficulty seems to be that the pillars are not sufficiently thick to support the roof pressure and permit of a high percentage of extraction of the coal. I submit the accompanying sketch (Fig. 1), showing a section of the mine only. It may be assumed that all of the work inby on this pair of entries and to the rise of the same has been completed and the pillars drawn. The figure shows the work in progress of drawing back the pillars in rooms 5 to 9, inclusive; while room No. 4 is shown as being driven through the barrier pillar that separates the faces of these rooms from the air course above.

The plan is to drive each room, successively, through this pillar, and then start the work of drawing back the pillars from the lower rib of the air course. Before doing this, however, the upper block, in each pillar, which is 30x60 ft., is divided by driving a crosscut 10 ft. wide, through the center of the block. The upper and lower halves are then divided, in turn, by a similar heading, 12 ft. wide. The remaining four blocks into which the pillar is thus divided measure, each 9x25 ft. These smaller blocks are then taken out, in turn, starting at the upper inby corner. It may be necessary to stand props to prevent the falls from crowding the work on the pillars. This operation is repeated on each one of the blocks in succession, observing the precaution to keep the line of pillar work regular and to draw all timber so as to permit the roof to fall in the rear of the work.

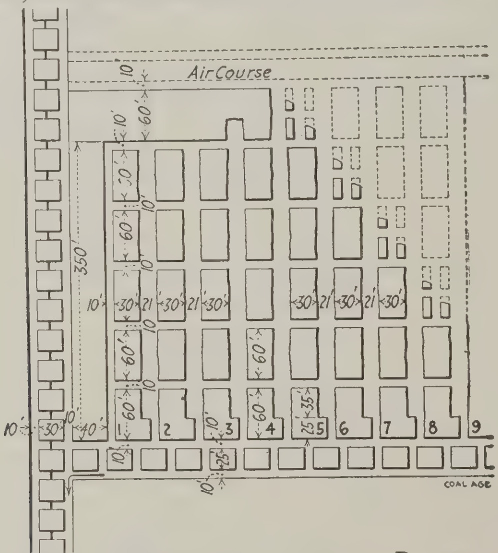


Fig. 1. Retreating Plan of Drawing Pillars and Barrier

In regard to the proposition stated by West Virginia Engineer, I would mine all coal by machines, provided the conditions permit. The rooms should be driven not more than 20 ft. wide to get the maximum amount of coal. These rooms should be driven on 80-ft. centers, so as to leave 60-ft. pillars between them, which should provide a sufficient support to prevent any heaving of the bottom.

In some instances, under similar conditions, the rooms are driven on 100-ft. centers, and the method has been working successfully for several years. From 95 to 96 per cent. of the coal is taken out. In any method of longwall, it is important to draw all timber, so as to allow the roof to settle uniformly on the gob. This applies, also, in drawing pillars in the room-and-pillar method. No stumps of coal must be left, to provide local surface support for buildings, as this is a false security and often results in greater damage than where all the coal is taken out.

William D. Roberts.

Rock Forge, W. Va.

⁂

Letter No. 5—Referring to the inquiries of W. N. Anderson and West Virginia Engineer, Coal Age, Nov. 15, p. 745, in regard to working coal under sandstone roof with a soft bottom, I offer the following as being a good method to pursue in such a case:

Mr. Anderson states that the rooms are driven 21 ft. wide, with 30-ft. pillars between them, giving 51-ft. centers; and adds that the rooms are protected above by a 60-ft. barrier pillar, which separates them from the next pair of entries. It is my belief that the room pillars are too small and there is too much open work in this case. The bottom will heave in spite of anything that can be done to prevent it.

Under these conditions, I would suggest retimbering the first five rooms before starting the work of drawing back the pillars. A board or foot-piece should be used under, instead of a cap on top of each prop. This footboard should be 3 in. thick and 12 in. wide by 3 ft. long. Then, start drawing back the pillars in these five rooms; and when the work has advanced a good distance and the bottom begins to heave badly on the road draw or shoot all the timber possible, so as to start a good fall of roof behind, which will relieve the weight on the pillars. It is important, however, to continue timbering the rooms back toward the entry.

In the mine where I am now employed, we had the same trouble. The top was a heavy sandstone, while the coal was underlaid with 2 in. of slate and from 6 to 10 in. of coal. A portion of this mine was old workings that had been standing for a considerable length of time. I found that the only method was to produce a good fall of roof, to accomplish which I often had to shoot all the timber standing in the places. This gave good results.

I would suggest that Mr. Anderson's rooms be driven (Fig. 2) on 60-ft. centers with 40-ft. pillars, making the rooms from 18 to 20 ft. wide. It would be better to leave a barrier pillar of 150 ft. and drive the cross-entries on 75-ft. centers. These cross-entries should be driven 200 ft. before any rooms are turned. The rooms could then be driven 400 ft. deep without producing any undue pressure on the pillars.

I have used this system with good success. When the first two rooms have reachel the limit, I would pull the track in the first room and start drawing back the pillar through room No. 2, continuing this as far back as the first crosscut in the rooms. This first crosscut was made 100 ft. from the entry. Since the West Virginia mining law requires crosscuts to be made at distances not to exceed 80 ft. apart, it was necessary here to build square packs of slate and dirt in the first five rooms. Before the first fall of sandstone occurred, I had arranged an opening in room No. 1, so as to ventilate the falls and prevent any accumulation of gas above them.

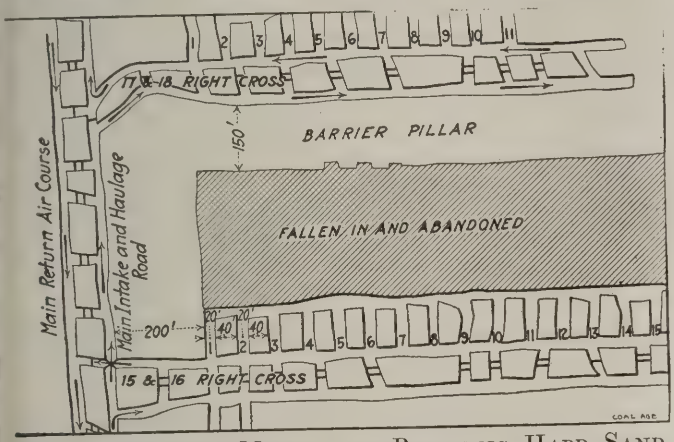

FIG. 2. PROPOSED METHOD OF BREAKING HARD SANDSTONE ROOF

In regard to drawing back the barrier pillars, it was necessary to drive an opening or room 30 ft. in advance of the rooms turned off the entries, through which the work of drawing back the barrier was started. The entry or chain pillar, and the room stumps up to the break line were all drawn back together. A great saving of material is effected by drawing the track in the rooms, as the falls occur, and using the same in the rooms being driven.

JAMES H. HUGHES, Mine Foreman,
The American Coal Co.

Mannering, W. Va.

⁂

Letter No. 6—Replying to Mr. Anderson's inquiry, in regard to working coal under a sandstone cover, I want to say that it is important to break the roof in order to relieve the pressure of the overburden on the pillars. To do this (Fig. 4) I would double shift the entire line of pillars and draw these back as rapidly as possible for a distance of, say 150 ft. This should start a break in the sandstone, but if one does not occur in this distance, drillholes should be put up in the roof, in a line parallel to the face. These holes should be 10 ft. deep and spaced a distance of 20 ft. apart. The holes should be charged and fired by a battery when the men are out of the mine.

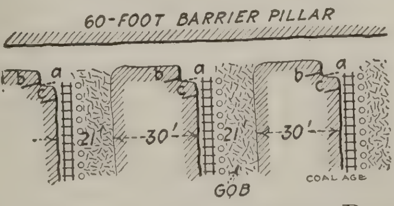

FIG. 3. METHOD OF EXTRACTING PILLARS

When a break is once started, there will be no further trouble, but it will be necessary to keep the pillar work in line with the break and to protect the men with a double row of timbers or cogs. In the accompanying sketch, I have shown a section of the pillar work, with a track laid across the rooms and a double row of posts. The track must be shifted back following the work on the pillars. Each line of timbers should be drawn regularly and a new row of posts set. The posts, or "cogs" if necessary, should be set on a pile of slack or slate, so as to enable them to be removed readily; but if these should become wedged too tightly, they must be blown out with dynamite.

H. GEDOSH.

Poteau, Okla.

⁂

Letter No. 7—In reply to the question of Mr. Anderson, on drawing back pillars under sandstone cover, I wish to say that the best method to adopt will be to draw these pillars back in line with each other, for if this is not done, those pillars that fall behind the rest will be subjected to a greater pressure than the others, and the coal will be crushed.

In my opinion, the work of drawing back the pillars should have been commenced as soon as each room reached the limit, but always leaving a stump of sufficient size to protect the entry. The work on each pillar should be started by driving a crosscut at the face so as to leave a loose end. In Fig. 4, I have shown my plan of working the pillars in steps. I have used this method in drawing pillars in the lignite mines, at Alba, Texas, where I formerly worked.

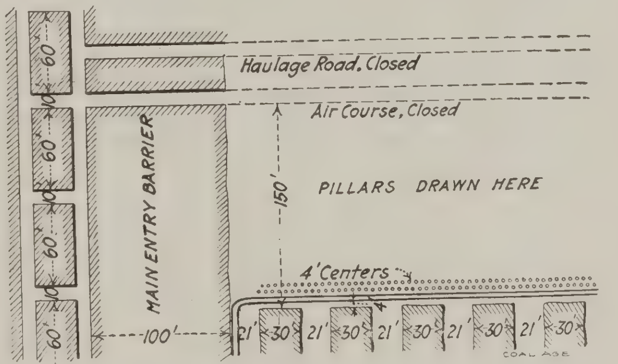

FIG. 4. PROPOSED METHOD OF DRAWING PILLARS

In this plan, the shot *a* was first put in on the rib, about 6 ft. from the end of the pillar. This shot blew off the corner of the pillar, as shown. A second shot *b* is then put in, which blows off another piece on this skip, and this is continued across the width of the pillar. The coal is taken out on the track which runs close to the straight rib of the room. If possible, another track might be laid up the other side of the pillar by clearing the gob. This, however, will often be impracticable, and the coal must be taken out on the single track, as just mentioned. A row of posts is now set across the face to protect the end of the pillar, and a second skip is started by placing a shot at *c*. The work is continued across the pillar, as before, the coal being cleaned up and taken out on the track, as mentioned. A second row of posts is now set across the face, after which the first row of posts may be removed.

If the roof does not break when the work has progressed a good distance, holes should be drilled in the roof and shots fired to start the break. In order to avoid the heaving of the bottom, larger pillars should have been left in the planning of this mine. It is best under such conditions to make the width of the pillar twice the width of the room.

Where the gob has not been filled tight to the roof. it may often be necessary to clear spaces at intervals in the gob and set heavy cribs or timbers to relieve the pressure on the pillars. If the roof coal has been left up in the first working it must be recovered when the props are knocked out or drawn.

JOSEPH JELINEK.

Newcastle, Texas.

⁂

Education and Training of Mining Men

Letter No. 5—Referring to the letter of Samson Smith, COAL AGE, Nov. 15, p. 743, I believe with him that boys ought to be taken into the mines and given a practical training in the different branches of mining work. Before this can be done, however, the boys should have a thorough school education and possess a knowledge of mine gases, ventilation, electricity, compressed air, and the general principles of mining and mining machinery. Mr. Smith refers to the many Scotch and English miners who are now the best mine foremen in this country today and who went into the mines when they were boys; but he must remember that the conditions in England, in this respect, are quite different from our conditions here.

Everyone acquainted with mining in this country knows that shiploads of men who have never seen the inside of a mine are being landed in New York every week, and these men come in large numbers to the mining districts and are put to work in the mines. I believe I express the sentiments of most mine bosses when I say we are pleased to see them, as we can generally place them with one of their own countrymen who will look after them and give them what they are worth for a few months, or until such time as they learn to look after themselves.

Owing to the large numbers of this class of labor, it becomes the duty of every mine foreman to educate these men in the best way he knows how. Unless he can speak a half dozen different languages, however, he must give them the instruction they need through the miner who employs them. I have always had much sympathy for men who do not understand the language or what is expected of them in the mine; but I have found the best means of educating them is through kindness.

We must be practical in all of our suggestions. It is of no use to assume conditions that do not exist in the mine, and lay out a plan, which we will find on going into the mine in the morning cannot be put into practice because there are men there of all nationalities, creeds and degrees of intelligence. One might as well discharge a man at once as to ask him to work with another of a different nationality.

The suggestion made by Mine Inspector Nesbitt that instructors be employed to go around the mine and show these men how to take care of themselves, would no doubt be a paying investment in many large mines. The suggestion is worthless, however, in respect to a mine running on a small margin of, perhaps, a cent per ton.

The principle is generally recognized that the more intelligent and efficient a workman becomes, the greater benefit he is to himself and his employer. If a brattice is to be put up or a switch to be laid, the mine foreman generally picks out a good worker of less experience and sends him along with an experienced bratticeman or tracklayer to do the job. In this way, the new-comer gains his experience and becomes more valuable to himself and his employer; but it frequently happens that as soon as a man has received his training in this way, he overestimates his ability and looks for work elsewhere. It is much the same with a coal digger. A greenhorn comes from the old country, gets a little experience in the mine, and soon makes up his mind that the coal is a little softer or the roof better in another mine, and he is gone. I believe that kindness and sympathy will do more to win and hold these men than anything else, as by this means we gain their confidence.

THOMAS HOGARTH.

Heilwood, Penn.

⁂

The Certificate Law

Letter No. 5—I have been interested in the discussion of the mine foreman's certificate, being made nation wide, as proposed by Mr. Dixon, COAL AGE, Oct. 25, p. 604. And I would like to say that I for one am entirely opposed to such a proposition.

Everyone who has been much around, knows the conditions are so varied that one examination can hardly cover the ground in a single state, and much less could it be made to meet the needs of different states. A man might successfully manage mines in some of the districts in this state, for example, and yet utterly fail in respect to safety in another state. Some mines have gas, dust, water, bad roof and dangerous quantities of blackdamp, while others have but one or two of these troubles to contend against, or perhaps are free from all of them.

Fancy a man, for instance, who has had charge of mines in the Clearfield region, but with no other experience, coming to take charge of the gaseous mines of West Virginia, or the mines on the Monongahela, or some of the mines in the Panhandle region. And what shall we say of the solid shooting in Illinois and Oklahoma, or the dusty mines of Colorado, or the broken roof and faulted conditions of the anthracite mines.

Perhaps there may be someone who is versatile enough to make an examination that would cover all of these regions, but that has not been my experience. I think such lowering of the bars would be a mistake. Surely, if any man wants to take a position in another state, he ought to have the ability to stand the examination in that state; and, as to the cost, that is a mere bagatelle.

I have stood examinations myself in different states and countries, and see no reason why others should not do the same. To my mind, safety is obtained by experience and training alone; and no one man's knowledge is broad enough to cover all the conditions of the different states without such training.

JOSEPH VIRGIN, Supt.

Moundsville, W. Va.

Letter No. 6—Referring to the recent interesting discussion of the mine foreman's certificate, I want to say, in my opinion, it would be of material benefit to the mining world if each man holding a certificate were called before an examining board, at least once every two years, and given such an examination as would enable the board to determine whether or not he is keeping abreast of the times.

It often happens that men by a brief study of mining books and from personal information are able to pass an examination, without having the all-essential experience that makes them fit to assume the duties and responsibilities of mine foreman. I could mention several men who hold mine-foreman certificates who cannot take a safety lamp apart, clean, fill and put it together again properly. They would not be able to ventilate a pair of entries without a room turned, to say nothing of ventilating the working faces of a large number of rooms. While this may seem a sweeping statement, it is a fact that can be confirmed; and although accidents will occur, at times, in mines in the charge of men who have had a life-long experience, they are not as frequent in such mines as in others where incompetent foremen are employed.

I hope to see the time come when every mine foreman who holds a certificate will be required to stand another examination at least once in four or six years. I am willing to take my chances with an intelligent examining board. I believe such a board should have power to revoke any certificate when the man who holds the same fails to come up to the standard of the examination. I agree fully with District Mine Inspector Rose, when he says that candidates should be examined every six years. Mr. Rose sounds the keynote to safety in mines, as far as the mine foreman is concerned.

I have in mind one man who never worked six months in a coal mine, but holds a first-class certificate. This man carries a safety lamp in the mine, but could not tell gas from sunshine. The same man has said that he carried the lamp so that the miners would think everything was all right, adding that "any fool can boss a coal mine." In view of some facts, I am almost forced to the same conclusion myself.

When I first took charge of the mines here I found a poor current of air traveling, largely caused by a door so placed as to choke the air current that was trying to find its way through the mine. This door was set by a man holding a first-class certificate. The question may be properly asked, "Who is to blame?" I say, Give me a man who has experience, as well as technical knowledge.

A. H. Stansberry, Mine Foreman,
Big Mountain Coal Mining Co.
Oliver Springs, Tenn.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

GREATEST COMMON DIVISOR

The greatest common divisor of two or more numbers is the greatest number that will exactly divide each of them. The operation of finding the greatest common divisor depends on the following:

Principle—Any number that will exactly divide the difference of two numbers and one of them, will exactly divide the other also; and an exact divisor of a number is also an exact divisor of any multiple of that number.

The application of this principle gives the following:

Rule—Divide the greater number by the less. Then continue to divide the last divisor by the remainder till the division is exact. The last divisor is the greatest common divisor of the two original numbers.

If there are more than two numbers, however, find the greatest common divisor of two of the numbers, as explained and then find the same for that divisor and another of the numbers; and continue this operation till all the numbers are used. The last result is the greatest common divisor of the numbers.

Example—Find the greatest common divisor of 77 and 396.

Solution—

$$\begin{array}{l} 77\,)\,396\,(\,5 \\ \underline{385} \\ 11\,)\,77\,(\,7 \\ \underline{77} \\ 0 \end{array}$$

Proof—

$$\begin{array}{r|rr} 11 & 77 & 396 \\ \hline & 7 & 36 \end{array}$$

Therefore, 11 is the greatest number that will exactly divide both 77 and 396.

Example—Find the greatest common divisor of 42, 63 and 98.

Solution—

$$\begin{array}{l} 42\,)\,63\,(\,1 \\ \underline{42} \\ 21\,)\,42\,(\,2 \\ \underline{42} \\ 0 \end{array} \qquad \begin{array}{l} 21\,)\,98\,(\,4 \\ \underline{84} \\ 14\,)\,21\,(\,1 \\ \underline{14} \\ \;\,7\,)\,14\,(\,2 \\ \underline{14} \\ 0 \end{array}$$

Proof—

$$\begin{array}{r|rrr} 7 & 42 & 63 & 98 \\ \hline & 6 & 9 & 14 \end{array}$$

Therefore, while 21 is thus shown to be the greatest common divisor of 42 and 63; 7 is found to be that of the three numbers 42, 63 and 98. In other words, 7 is the greatest number that will divide each of these without a remainder.

LEAST COMMON MULTIPLE

The least common multiple of two or more numbers is the least number that is exactly divisible by each of the given numbers. Thus, 24 is the least common multiple of 6 and 8; because it is the smallest number that is exactly divisible by both 6 and 8.

The Coal Age Pocket Book

Rule—Write the given numbers in line and divide successively by any prime number that will exactly divide any two of the numbers. The continued product of the several divisors and the remaining quotients or numbers is the least common multiple of all the numbers.

Example—Find the least common multiple of 24, 30, 54 and 150.

Solution—

$$\begin{array}{r|rrrr} 2 & 24 & 30 & 54 & 150 \\ \hline 3 & 12 & 15 & 27 & 75 \\ \hline 5 & 4 & 5 & 9 & 25 \\ \hline & 4 & 1 & 9 & 5 \end{array}$$

$$2 \times 3 \times 5 \times 4 \times 9 \times 5 = 5400$$

Proof—

$$\begin{aligned} 5400 \div 24 &= 225 \\ 5400 \div 30 &= 180 \\ 5400 \div 54 &= 100 \\ 5400 \div 150 &= 36 \end{aligned}$$

CANCELLATION

In the solution of mathematical problems, it frequently happens that there are a number of factors involved as multipliers or divisors. In such cases, instead of performing each separate multiplication and division, the work is much shortened by writing all the multipliers in the numerator and all the divisors in the denominator of a compound fraction, and then proceeding to cancel all the factors common to both terms of the fraction. When this has been done the remaining factors of the numerator are multiplied together, as also those of the denominator, and the former product divided by the latter. An example will serve to illustrate the process.

Example—A certain mine produces 100,000 tons of coal in a year of 270 working days. In this mine, the average number of men employed was 150 and they worked 8 hr. a day. On this basis, what output may be expected from a mine employing an average force of 240 miners, who work 9 hr. a day, for a year of 210 working days?

Solution—Without reference to the use of ratio and proportion, to be explained later, it is necessary to divide the tonnage produced in the first mine, successively, by the number of men employed, the days they worked and the hours per day, to obtain the output per man per hour. Then, this multiplied, successively, by the same factors in respect to the second mine, will give the probable output for that mine.

Thus, $100{,}000 \div (150 \times 270 \times 8) = \frac{25}{81}$ tons per man, per hour. Finally, $\frac{25}{81} \times 240 \times 210 \times 9 = 140{,}000$ tons.

As previously stated, the work is much shortened by writing all the multipliers including the tonnage of the first mine, in the numerator and the divisors in the denominator of a compound fraction and canceling out common factors; thus,

$$\frac{100{,}000 \times \overset{\cancel{8}}{\cancel{240}} \times \overset{7}{\cancel{210}} \times \cancel{9}}{\underset{5}{\cancel{150}} \times \underset{\cancel{9}}{\cancel{270}} \times \cancel{8}} = \frac{700{,}000}{5} = 140{,}000 \textit{ tons}$$

EXAMINATION QUESTIONS

Miscellaneous Questions

(*Answered by Request*)

Ques.—What gases result from the explosion of dynamite?.

Ans.—The products of the explosion of dynamite are carbon dioxide (CO_2), nitrous oxide (N_2O), nitrogen (N_2) and water vapor (H_2O). The reaction that takes place is represented by the equation:

$$2\,C_3H_5(NO_3)_3 = 6\,CO_2 + N_2O + 2\,N_2 + 5\,H_2O$$

Ques.—What gases are formed during a mine fire?

Ans.—The composition of the gases resulting from a mine fire will depend chiefly, if not wholly, on the quantity of air present. In a plentiful supply of air, the combustion will be more or less complete, producing carbon dioxide (CO_2). If the ventilation is slack, and the air supply insufficient for complete combustion, varying amounts of carbon monoxide (CO) and nitrogen (N_2) will be produced in addition to the carbon dioxide.

Ques.—If 20,000 cu.ft. of air and gas, at the maximum explosive point, is passing per minute through a mine, what is the quantity of gas given off and what quantity of air should be added to render the mixture nonexplosive?

Ans.—A firedamp mixture at its most explosive point contains 9.46 per cent. of gas (methane). The volume of gas carried in this air current or given off in the mine is, therefore, $20,000 \times 0.0946 = 1892$ cu.ft. per min. In order to render this volume of gas nonexplosive, it must be mixed with thirteen times its volume of air; or $13 \times 1892 = 24,596$, say 24,600 cu.ft. per min., which is the total volume of pure air in the current. The quantity of air to be added is, therefore, $24,600 - 20,000 = 4600$ cu.ft. per min.

Ques.—If a portion of a mine is worked with locked safety lamps and approved powder is used for blasting, how would you proceed to light the shots and what precautions would you take in performing this duty?

Ans.—Use none but an approved type of safety lamp. Having properly prepared and tested the lamp, ascertain that all of the men are out of the mine. Observe that the usual volume of air is in circulation. Proceed to the gaseous section of the mine and begin firing the shots on the end of the air, in this section first. With some possible few exceptions, fire only one shot at a time in a single working place, giving ample time for the smoke and gases to clear before firing succeeding shots. Advance thus in regular order against the air until all the shots are fired in this section of the mine. Follow the same general rule in the other sections of the mine. In every case, make a careful test for gas in the place and examine every shot before firing.

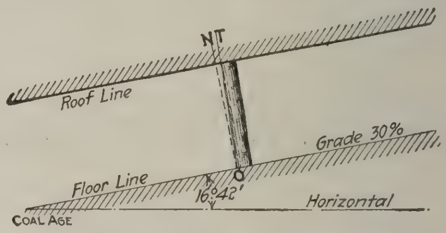
Ques.—What advantage is to be gained by turning the rooms at an angle with the entry?

Ans.—In flat seams, an advantage is often gained by turning the rooms in such a direction that they will cross certain clay slips or faults in the coal, or that the coal face will make a certain angle with the natural cleavage of the coal, so as to enable the coal to be worked "longhorn" or "shorthorn," according to requirements. The coal always works better when advantage is taken of these natural conditions.

In inclined seams, the levels, or gangways, are driven on the strike of the seam, allowing only sufficient grade to permit economical haulage and drainage. In moderate pitches, if the rooms are driven on the full pitch of the seam, the grade of the roads in the rooms will often be too great to enable the cars to be handled safely. This grade is reduced by driving the rooms across the pitch or at an angle with the entry.

Ques.—How would you set your timbers in an inclined seam and why?

Ans.—The posts should be set so as to lean slightly up the pitch, as shown in the accompanying figure. The pressure of the roof on the timber is exerted in a direction NO, normal or perpendicular to the seam. As the extraction of the coal proceeds, the roof has a tendency to slip downhill. If the post was set normal in the seam, or perpendicular to the roof and floor, the slipping of the roof downhill would loosen it, and it would fall out; but when the post is "upset," or inclined up the pitch, as shown in the figure, any movement of the roof downhill will tend to tighten the post.



Standing Timber in an Inclined Seam

Ques.—What are the advantages of driving rooms on sights, and how would you keep rooms straight without sights?

Ans.—The advantage of driving on sights is that all the rooms then keep the same general direction and the width of the room pillars is maintained uniform; or, in other words, the rooms do not "hole" into each other. When no sights are used, the miner keeps his direction by sighting back along the rail.

Ques.—What is a squeeze?

Ans.—A squeeze, in coal mining, is the effect produced by the overburden settling down heavily on the supporting pillars in the mine. The effect is indicated, in greater or less degree, by the sagging of the roof, the crushing of the pillars, or the heaving of the floor, or any or all of these combined.

Ques.—What method or means is most effective in arresting the progress of a squeeze?

Ans.—When a squeeze has attained any headway, its progress can only be arrested by causing a heavy fall of roof, by drawing all pillars and timbers over a considerable area, which has the effect to overarch the weight resting on the pillars, causing it to rest on the waste.

COAL AND COKE NEWS

Washington, D. C.

Attorney-General McReynolds has prepared a report for the year 1913 which was made public on Dec. 9 and in which he gives the most uptodate and thorough data yet available with respect to the coal cases prosecuted by the Department of Justice under the anti trust and other laws.

Mr. McReynolds first deals with the subject historically, and reviews the anthracite coal case, saying in part:

> "It was held (1) that the defendants including most of the anthracite coal carrying railroads and affiliated coal companies were unlawfully combined in restraint of trade through the instrumentality of the Temple Iron Co., whose stock they owned in agreed proportions, and through which they purchased a number of independent mines and prevented the construction of an independent railroad; (2) that the system of agreements known as 65 per cent. contracts, by which the defendants acquired control of the independent output, were in restraint of trade.
>
> The decree enjoined the defendants from voting or receiving the dividends on the stock of the Temple Iron Co., or otherwise attempting to exercise any control over it, and canceled the 65 per cent. contract. A general charge that the defendants were engaged in a combination in restraint of trade was dismissed. The charges against separate groups of the defendants, namely, (1) the Reading Co. and affiliated corporations, (2) the Lehigh Valley R.R. Co., and affiliated corporations, and (3) the Erie R.R. Co., and affiliated corporations, were not determined but were left to be dealt with in separate proceedings."

The Attorney-General then takes up the status of other cases and refers particularly to the case of the United States vs. the American Coal Products Co., in which a decree was entered by consent on Mar. 4, 1913, and the case of the United States vs. the Reading Co., et al. in which a petition was filed Sept. 2, 1913, against a combination consisting of the Reading Co., and affiliated corporations, charging it with restraining and monopolizing trade in anthracite coal, in which the defendants have only recently answered. As to cases under the commodities clause, Mr. McReynolds says:

> In the United States vs. the Delaware & Hudson Co. the Supreme Court construed the commodities clause as prohibiting a railroad from transporting articles in which at the time of transportation it has any interest, direct or indirect, in a legal or equitable sense * * * in a later case the Court held that if the corporation owning the articles transported by the railroad was so completely identical with the railroad as to be but an arm of the railroad then the railroad would have an interest in the articles in the sense of the statute just as if the railroad held a title to the articles in its own name.
>
> It is to be observed that under this construction the statute is not violated unless the railroad has the required interest in the articles at the time of transportation. It may have been the producer of the articles but if it parted with the title before transporting them it does not violate the act of Congress.
>
> Thinking to bring themselves within this construction of the act the following plan has been devised: A railroad company engaged in mining coal either directly or through a controlled corporation which is but a part of itself will organize a new corporation, the stock of which will be distributed rateably among the stockholders of the railroad; whereupon the railroad will sell to the new corporation at the mouth of the mines its production of coal. This plan has been challenged in the case now pending in the district of New Jersey against the Delaware, Lackawanna & Western R.R. Co. and the Delaware, Lackawanna & Western Coal Co., the contention of the Government being that a corporation after all is but an association of persons and that under this plan the same association of persons which mines the coal transports it, and that therefore such transportation is a violation of the act of Congress.

Coal Inspection and Analysis

Another in the long series of bills introduced for the control of the coal mining and selling industry has been offered by Representative Treadway of Massachusetts and is a plan for the inspecting and analyzing of coal, the results to be furnished to purchasers. The alleged purpose of the bill is to prevent sales of inferior coal possessing an unduly small number of heat units from being made to individuals Mr. Treadway's plan is to have the Government apply the same methods of analysis which are employed in the army and navy where the British thermal unit system is adopted in order that the purchasers may be informed whether they are getting the coal that is represented or not.

Mr. Treadway says that the coal of ordinary use is the most general and necessary commodity of everyday consumption and that the consumer ought to be able to know in the same way and for the same reasons that he is informed concerning the constituent elements of foods, of the real nature of the fuel he obtains.

It is thought that the Bureau of Mines might be entrusted with the task of thus sampling and certificating the coal which is to be subjected to analysis. The bill will be taken up by the House Committee on Interstate Commerce and its consideration will probably be bunched with that of a multitude of other coal bills introduced last session and this, that are now pending before the Committee.

Probable Action on Alaskan Railway

The general examination of the outlook for the Alaska Railroad bill has given rise to confident prediction that the Senate will act on that measure at an early date and will provide an appropriation of at least $35,000,000 to be expended by the President in the construction of the desired roads in Alaska locating them in such a way as to open up the coal fields of the territory.

Senator Pittman of Nevada who is attempting to further the progress of the bill asserts that it will pass shortly and that in his judgment the measure will mean a saving of $1,000,000 a year to the Government in its purchases while it will also open large fields of other minerals.

HARRISBURG, PENN.

Auditor General Powell is getting ready to proceed with the collection of the state tax on anthracite coal, provided for by the act of 1913, and all producers will be required to make a statement of their output at the end of the present year.

The department will send bills for the amount of the tax based on the returns made by the operators, who are required to make reports under oath, and it is expected that a test of the constitutionality of the act will be inaugurated without much loss of time by the coal operators. Next year the state will not have the proceeds from one-fourth of personal property tax as an item of income. This amounted to about $1,300,000 this year, and it was the idea of the Legislature that the state's share of the coal tax would make this up. According to reports received, some operators have been charging the tax on their bills of sale of coal.

A systematic inventory of the water and water-power resources of the state of Pennsylvania is being discussed by the Water Supply Commission, and it is the plan to cover every stream in the state and to prepare for the people a list of all streams, their flow, the horsepower and other data. This will be a movement toward conservation and for the retention by the state of the water power now going to waste in many localities.

The commission has been chary about approving applications for charters for power companies in the last two years and only a few big water-power projects have been granted letters patent. Others have been so restricted that but little has been done toward putting them into operation.

This move by the state will no doubt help many coal companies who suffer several months of the year for water, and which many of the progressive companies are guarding themselves against by erecting large tanks and by building reservoirs.

Officers of the U. M. W. of A. are protesting to the operators against cutting coal and loading the same on Sundays, stating that hereafter the work will not be performed.

It seems that men employed in the strippings have been compelled to load coal on Sunday. They claim there is no necessity for doing this. They will agree to perform any necessary labor on the Sabbath so as not to interfere with prompt operations on Monday morning, but loading coal they assert is an abuse of rights.

They point out the fact that even during slack time in the coal trade men are compelled to work on Sunday and are laid off on days that the breakers are idle.

State Chief of the Dept. of Mines, Jas. E. Roderick, is taking steps to secure precautions against accidents in the mines of the state by issuance of stringent regulations in mines and instructions to inspectors to see that they are enforced. Every mine is being covered.

Union Organizers Have Been Busy

Field organizers of the United Mine Workers of America have been busy in District No. 2 (bituminous region) during the past several months, and the result is that the union is stronger, both numerically and financially.

At a number of the mines throughout the district, especially in Clearfield and Jefferson Counties, "closed shop" which means that only members of the union will be given employment, has been established, and great efforts are being made to make the organization as strong as possible so that the men will be in a position to present the strongest possible case, when they meet in convention at Dubois in March for the purpose of entering upon a two-years' wage agreement.

Indiana County has been the weakest county in the district, so far as membership is concerned, and an effort is being made to unionize the mines there.

If there is any opposition to the work of the U. M. W. of A. on the part of the operators it is not apparent on the surface. It is the contention of some of the operators that they have better success in the operation of their mines when they deal with the union than when they endeavor to make individual agreements with the men. Both the operators and the men are making preparations for the best possible working agreement when they meet in joint convention to Dubois in March.

There are four important demands which the miners will make at the joint conference. They will ask that the system of pushing cars to and from working places to the entries by the miners be abolished; a uniform day wage scale for all labor inside and outside the mines; a more strict rule enforcing the eight-hour day, and an eight-hour day for all engineers and firemen. There may be other demands made by the miners, but it is intimated that the men will insist upon those four things going into the next wage agreement.

The members of the United Mine Workers throughout the state are making arrangements to send delegates to attend the convention of the organization to be held at Indianapolis on Jan. 20. This is the 24th convention, the meetings having been held annually heretofore, but are now being convened biannually, so as to come in the January before the March on which the two-years' wage contracts entered into with the operators expire. The wage agreements in every mining district on the American Continent, between the United Mine Workers of America and the operators, expire in March next, except the new agreements recently made in West Virginia and the anthracite region of Pennsylvania.

PENNSYLVANIA

Anthracite

Lykens—The school boards of Lykens and Wiconisco are considering a proposition to start a night school for the people of the two towns. The activity in this line is the direct result of the formation of the Miners' Institute several weeks ago. Mr. Aulman, superintendent of the mines and Mr. Kutzner, mining engineer at the mines, both members of the institute served as a committee to meet the board.

Tamaqua—All employees of the Lehigh Coal & Navigation Co. in the Panther Creek Valley, with the exception of those at the Nesquehoning colliery and the washeries, recently went on strike as the result of a new order issued by the company. Heretofore, inside men have worked from 7 a.m. to 4 p.m., without a noon hour, for a day's work, while under the new order the company desires all employees to take 45 minutes off for lunch and end the day at 4:45 p.m. working the same hours per day, but meaning a later quit for the men.

Old Forge—The deal which has been pending for some time past for the purchase of the Sibley Colliery of the Elliott-McClure Co. by the Pennsylvania Coal Co., has been closed, and the latter company has assumed charge of the operation. The colliery is located in Old Forge, and the tract is of about 350 acres, three veins, the Red Ash, Clark and New County, being mined. Shortly after the change in ownership the employees went on strike, claiming that when the grievance committee of the union started to examine the due cards, the officials of the company ordered them to stop.

Scranton—Residents of the Green Ridge section of Scranton, aroused by the danger of mine caves and the failure of the coal companies to provide relief, have passed a resolution that a petition be sent from the residents of Scranton and vicinity, to Governor Tener, requesting the condemnation of all coal lands in Lackawanna County. It is generally understood throughout that section that what the property owners desire is that the State of Pennsylvania take over all coal lands and operate them, thus displacing the companies and officials about whom the people complain.

Plains—Residents in the vicinity of Henry St., between Merritt and William Sts., Plains, are becoming frightened at the number of cracks appearing in the surface in that vicinity, and in the concrete foundations of several houses nearby, caused by mine settlings. The Madeira-Hill Co. and the Delaware & Hudson Co. have coal lands in this section.

The miners at the Madeira colliery of the Wilkes-Barre Coal Co., who have been on strike, have decided to return to work pending an adjustment of their grievances. The men claim that under the schedule of rates in force between them and the company, for the removal of fire clay from the Ross vein $1.21 per yard should be paid. The section of the vein now being worked does not contain clay, but there is a stratum of rock which must be removed. The men claim they should be paid the same for removing the rock as for the clay, but this the company refuses to do.

Bituminous

Nanty Glo—The mines of the Springfield Coal Co., which were closed recently through the destruction of the boiler house and tipple by fire, have resumed operations. Repairs have been completed and the company starts again with better equipment than previously.

Conemaugh—The Park Hill Coal Co., which is driving a slope into the "C" coal vein, is taking out about 3 ft. of fine grade limestone in the process. The stone is being removed principally to furnish room for the headings, but the material is a valuable byproduct, as it can be used for several purposes, notably ballasting of tracks, in the blast furnace, and on the new state highway. The output of the new mine is about 500 tons a day at a minimum, with an ultimate capacity far in excess to that figure, when the company taps the "B" coal seam, as is planned later. Three shifts will be kept busy in development work for some time.

Morrisdale—The Morrisdale Coal Co. has disposed of its electrical plant to the Penn Service Co. and is paying the electrical plant for the power used to operate the mines.

Dubois—About 800 miners employed at the Eriton mines, of the Northwestern Mining and Exchange Co., are on strike, tying up the mines. The trouble is that the men insist upon the "closed shop." At the time of the walk-out, all of the employees, with the exception of four, were members of the union.

Pittsburgh—On Dec. 7 Judge Buffington, of the U. S. Circuit Court, granted a receivership to the Pittsburgh-Buffalo Coal Co., one of the largest independent coal concerns operating in the Pittsburgh district. This action was taken upon the petition of F. R. Babcock, J. W. Ailes, and John H. Jones, of Pittsburgh. At the same time Judge Dayton, of the U. S. District Court at Philippi, W. Va., granted the petition of the same men for a receivership for the Four States Coal & Coke Co. The Pittsburgh-Buffalo Co. operates properties at Marianna, Canonsburg, Burgettstown, and Bruceton, while the latter firm operates mining properties in the Mannington and Cabin Creek districts of West Virginia.

WEST VIRGINIA

Charleston—According to a report of the mine department of the state, there are 70,321 miners employed in West Virginia mines. Of this number 36,612 are of American descent, 14,000 are negroes, and 23,709 foreigners, of whom the majority are Italians.

It is the general opinion here that the 50 million dollar coal deal in the New River field will be consummated shortly. It is said that 85 per cent. of the owners and operators in the New River field have verbally agreed to the conditions imposed by the English syndicate. It is the desire of the purchasers that all operators in the New River field join them, and 50 million dollars in gold will be paid between the time the contracts are delivered, and June 1. This price is to cover operations and coal lands in Fayette, Raleigh. Greenbrier and Nicholas Counties.

Huntington—Arrangements for the employment of a large number of men to work in the mines of the Marmet Coal Co., near Marmet, W. Va., is being made by officials of that firm. Improvements are to be made by this company including the building of boarding houses to be constructed for the use of the laborers to be employed. Application has been made to the municipal employment bureau for both mine and other labor, and it is understood that a large number of men will be put to work about the first of the year.

TENNESSEE

Spring City—Col. George Wilkinson, of Philadelphia, Penn., is reported to be planning the purchase of a large acreage of mineral land in the vicinity of Spring City, Tenn., for immediate development, the work proposed including the operation of coal and other mines, the construction of coke ovens and a byproducts plant, the ultimate investment contemplated being in the neighborhood of $3,000,000.

KENTUCKY

Sebree—The Sebree Coal Mining Co. is planning to increase he capacity of its mine, installing a line of modern machinry. Lee Stone is manager of the company.

Sturgis—The West Kentucky Coal Co. is said to be working its nine plants to capacity, notwithstanding the fact that he mild weather and a short car supply have handicapped perations to a considerable extent. The company, which is he largest in the western Kentucky field, is planning still urther development work, which will cost between $400,000 nd $500,000.

Barbourville—It is understood that the Smith-Riley Coal o., recently incorporated, has acquired a plant in this viinity which is already in active operation, and that it will pen up other mines shortly.

OHIO

Columbus—Coal operators, at least a few of them in Ohio, are taking up the agitation to secure the passage of a law, similar to that of Canada which is designed to prevent harmful strikes in all lines of business. In the coal mining industry the danger of strikes is one of the worst features o contend with. The Canadian law provides that neither can the employee strike or the employer lock out his men, until 30 days after the controversy arose and only then after the arbitration commission has made every effort to secure a compromise and when all of the facts in the case are published. The law takes into account three parties to every labor controversy, viz.; the employer, the employee and the public. It is believed such a bill will be introduced in the coming session of the Ohio General Assembly.

New Philadelphia—Suit has been brought in the courts of Tuscrawas County by the Goshen Coal Co. against the Royal Goshen Coal Co. to collect $12,957.56 alleged to be due for coal illegally mined under the property of the plaintiff. The two properties adjoin each other in Goshen Township in Tuscrawas County.

Murray City—State Mine Inspector J. C. Davies accompanied by several of his deputies has opened Pittsburg Mine No. 8, which was sealed up last March because of a fire. The fire was found to be out and the mine will be placed in operation soon.

INDIANA

Linton—The new Summit-Linton mine, employing 200 men, is expected to be in operation the first of the year.

Sullivan—The old Shelburn mine, working vein No. 5, caved in recently, breaking the props and covering the tracks, making it necessary to abandon it. About five acres of land sank. The mine had had trouble with gas. The Citizens mine will be reopened about Christmas. A new tipple is being built. The shaft has been leased to J. R. Risher. It was formerly the property of the Monon Coal Co.

The last pay day to the miners in this vicinity brought them $20,000. Prospects are said to be good for steady work for the next six months. Miners at the Glendora drew $4500; at the Union, $5000, and at the Paxton, $5600, the balance being distributed among the smaller mines.

Indianapolis—The miners' washhouse law, passed by the last Indiana legislature, has been held constitutional by the supreme court of the state, but was appealed to the United States Supreme Court, where it is pending.

ILLINOIS

West Frankfort—The Chicago, Wilmington & Vermillion Coal Co. is commencing to produce coal at its new mine at Orient, north of here. The producing company has built a small sized town so as to have its miners right on the ground and reports have it that Orient is one of the latest and most sanitary and comfortable mining settlements in southern Illinois.

The new mine of the Old Ben Coal Co., formerly the Buchanan Coal Co., is down to coal. This new shaft is being sunk southeast of this place in a coal field that has never yet been touched, and it is understood that the coal shows up considerably better in quality than that from the field west of here.

Royalton—The Chicago, Burlington & Quincy R.R. has completed its branch to this point, and coal is now being loaded out from the mine of the Franklin Coal & Coke Co.

Marion—The White Ash mine, which has been abandoned and allowed to fill up with water at White Ash, three miles north of here, is being pumped out, and all the mining material such as rails, cars, etc., will be removed and the mine abandoned and sealed up. It is also understood that the tipple and washer are to be offered for sale to be torn down and removed.

Edwardsville—The Henrietta mine, which cost $65,000 to sink, has been sold for the second time for a price that would indicate that it was not worth even junk money. In August, 1912, the Federal Trust Co. bought it for 45c. and assumed a debt of $11,500. It was operated for a short time at a loss and was leased to W. S. Walker, who also operated it and failed, owing the miners several thousand dollars wages. The last sale is to Mrs. Philipina Kraft, of East St. Louis, and the records show that she paid $1 for it. However, it is understood that included in the deal was some real estate in St. Louis valued at $30,000.

A small local mine, operated by the City Coal Co., is being flooded by a stream from a nearby creek through a fissure in the air shaft. The mine inspector has ordered the mine closed.

ARKANSAS

Spadra—The West Spadra Coal Co., which has been sinking a new shaft for several months, has finally struck a 4-ft. vein at a depth of 245 ft. The coal is pronounced of superior quality.

Hartford—The strike which has been in effect for some time at mine No. 4 of the Central Coal & Coke Co., has been settled and the men returned to work on Dec. 1. The miners' contentions that a guard be placed at the fan house during the entire time the men were at work, has been granted by the operators.

Clarksville—The Sterling Anthracite Coal Co.'s property here has been ordered shut down on account of poor ventilation. This is one of the largest mines in Johnson County and has been employing non-union men.

OKLAHOMA

McCurtain—There is a probability that the mine of the Sans Bois Coal Co., which was the scene of a disastrous explosion several months ago in which 70 lives were lost, will soon resume operations. The mine has been closed since the disaster, and the company has gone into the hands of a receiver; but it is believed that operations will soon be resumed.

COLORADO

Trinidad—Workmen from outside districts are now arriving in considerable numbers to take the places of the striking miners in the southern Colorado fields. These are, for the most part, convoyed from the trains to the mines by military escorts.

Denver—The acquisition and operation of municipal coal mines suggested by the City Council to combat high fuel prices is entirely practical, but not demanded immediately. Such was the report rendered by the Public Utility Commission, following an investigation requested by the council into the advisability of such a proposition. It is the opinion of the Commission, however, that coal should cost considerably less in Denver than the prices now charged.

FOREIGN NEWS

Juneau, Alaska—The land office at Juneau recently decided that 21 coal claims of the so called McAlpine Group of 200 on Cooks Inlet should be held for cancellation because of fraud. The Promotors of the McAlpine Group were indicted in Detroit on Mar. 6, 1911, for a conspiracy to defraud the United States.

Cardiff, Wales—Fifteen thousand coal miners in southern Wales were thrown out of work Dec. 4 by the strike of engine drivers and stokers on the Great Western Ry. All traffic on the Welsh branch of the line was disturbed. Leaders of the strike, which began through the dismissal of an engineer for refusing to handle Irish freight, are trying to extend it to other lines.

PERSONALS

L. C. Crewe, general manager of the La Follette Iron Co., has been on a trip during the past week to Knoxville and Chattanooga, Tenn., and Birmingham, Ala.

Col. Harvey M. La Follette, president and general manager of the La Follette Coal, Iron and Railway Co., has been spending some time in New York on business for his firm.

A. P. Goedecke, for 28 years general outside superintendent for G. B. Markle Co., at Jeddo, has resigned, and will leave the service of the company on Dec. 20. His successor has not been named.

George Hartshorne, formerly fire-boss in the mines of the Atlantic Coal Co., of Boswell, Penn., has been promoted to the position of mine foreman, while George Watson, formerly fire-boss in the same mine, has been promoted to the position of ass't mine foreman.

Hywel Davies, formerly of Louisville, but now residing in Lexington, Ky., who is well known among operators in Kentucky, being president of the Kentucky Mine Owners' Association, recently resigned as a member of the board of trustees of the Kentucky State University.

Mrs. Sophia Coxe, widow of Eckley B. Coxe, is preparing again to make happy the 3000 children of the miners at the Coxe Brothers & Co. operations (now owned by L. V. Coal Co.) by distributing gifts of clothing, toys and sweets among them the day before Christmas, as has been her custom for nearly half a century.

George P. Lindsay, of Plymouth, secretary of the Parrish Coal Co. for many years prior to the merging of that corporation with the Lehigh & Wilkes-Barre Coal Co., has leased from the Turner Estate a tract of coal land about 25 acres in extent, near the old Jersey mine in Plymouth Township, and arrangements are now being made to develop the tract.

Stephen J. Hammon has recently been appointed superintendent of the Dorrance, Prospect and Henry E. collieries of the Lehigh Valley Coal Co., at Wilkes-Barre, Penn., to fill the vacancy caused by the death of Joseph Jones. Sheldon Jones has been appointed to fill the place formerly occupied by Mr. Hammond, as superintendent of the Franklin and Warrior Run collieries.

Elmer O. Long has tendered his resignation as assistant chief engineer of the Consolidation Coal Co., at Somerset, Penn., to engage in a private engineering partnership with Frank B. Fluck. The new concern will be known as Fluck & Long, with offices in Somerset. While they will carry on all kinds of engineering they will make a specialty of examination and reports on coal-mining properties, installation of coal-mining plants, and municipal work.

F. G. Tice, one of the best known coal men in the Appalachian District, recently resigned as general sales manager of the Carter Coal Co., of Johnson, Tenn., and will move to Colorado. This step was taken on account of the state of his wife's health. He will probably form a connection with some operating company in the Colorado field. Mr. Tice has been in the coal business for years, having been connected formerly with the East Jellico Coal Co., later becoming general manager of the Interstate Coal Co., which was acquired by the Carter Coal Co., with which he has since been associated.

CONSTRUCTION NEWS

Nanticoke, Penn.—Contractor Charles Breeme, of Wilkes-Barre, is at present at work on the new boiler houses that are being erected by the Susquehanna Coal Co. at the No. 7 Colliery.

Martins Ferry, Ohio—Work was started recently on the extensive improvements at the Webb Mine by the Pennsylvania R.R. and will continue for several months. This work includes moving the tracks at that place and changing the channel of Wegee Creek to accommodate the output of the new mine. A number of company houses have been erected at this mine during the summer and a force of men is now at work erecting the steel tipple.

Huntington, W. Va.—It has been announced that a firm to be known as the Ohio Valley Co., will shortly install an electric power plant at Logan, W. Va. Power lines will be laid over the entire Logan coal field, and will be run up and down the Guyan River, Main Island Creek, Buffalo and Dingess Runs. The plant will ultimately be of 30,000 kw. capacity composed of turbine units of 5000 kw. each. It is expected that work will be started upon this plant within three weeks.

Barbourville, Ky.—For some time past there have been persistent reports of a new coal railroad to be built in Tennessee or Kentucky for the purpose of connecting some extensive properties near Barbourville with the Louisville & Nashvile R.R. at Beattyville, a distance of about 65 miles. As the result of a recent conference between the parties interested considerable progress was made toward active operation. The new road will traverse one or two counties which have no railroads at present.

Bluefield, W. Va.—Aside from the erection of the gigantic power house at Bluestone Junction, which is now under construction for the purpose of supplying current for the electrification of the Norfolk & Western R.R. between Bluefield and East Vivian, it is understood that the erection of another building is contemplated which will be used for a machine shop and car barn combined. Nothing definite has as yet been made known regarding this latter structure, but a building of this kind will necessarily have to be erected at some point along the line between the two towns.

NEW INCORPORATIONS

Portage, Penn.—The Martins Branch Coal Mining Co., of Portage, has been organized with a capital stock of $20,000.

Pittsburgh, Penn.—The Pittsburgh-Syracuse Coal Mining Co., of Pittsburgh, has been incorporated with a capital stock of $50,000.

Barbourville, Ky.—The Smith-Riley Coal Co. has been formed by local coal men to operate the Blue Gem mine in the vicinity of this city. A plant already established has been taken over by the new organization.

Columbus, Ohio—The John M. Taylor Coal Co. has been organized at Columbus for the purpose of mining and dealing in coal. The capital stock is $45,000, and the incorporators are John M. Taylor, John W. Moore, J. E. Ridenour, E. G. Thornton, and E. E. Learned.

Charleston, W. Va.—The Bengal Coal Co. has been incorporated with an authorized capital stock of $100,000. The incorporators are E. P. Hopkins, A. E. Morgan, W. H. Cunningham, T. F. Bailey, Jr., and Frank Enslow, all of Huntington. The offices will be in Huntington, and the chief works, in the Triadelphia district.

INDUSTRIAL NEWS

Newcastle, South Wales—The coal exports from Newcastle, South Wales, for the first nine months of 1913 were 3,786,432 tons valued at $9,645,727, increases of 166,756 tons, and $409,625 respectively.

McKinney, Tex.—E. G. and S. E. King of this city have closed the deal exchanging their coal mine at Como, Texas, to D. M. Lovelace of Oklahoma City, for a plantation in Mississippi and $75,000 in cash.

Pittsburgh, Penn.—The Secretary of the Treasury has recommended the appropriation of $762,000 for the Bureau of Mines. Of this $10,000 is wanted for the steam and electric equipments of the Pittsburgh testing station.

Bluefield, W. Va.—Local railroad men say that Dec. 3 was one of the busiest days in the history of the Pocahontas division. Practically every engine and every crew in Bluefield were mustered into service to assist in moving the heavy tonnage out of the field east bound.

Hebron, N. D.—The Lignite Briquetting Plant operated here by the state was destroyed about midnight, Dec. 3, with a loss of $10,000 by fire of an unknown origin. The destruction of this plant will seriously hamper the state's investigation into the possibilities of lignite.

Springfield, Ill.—Trouble which threatened to result in a general strike in the Peabody coal mines in this vicinity has been amicably settled. A strike of miners at the Peabody No. 8 mine at Kincaid, resulting from a disagreement over the wage scale, caused the trouble.

Uniontown, Penn.—It is reported that a company is to be formed by the owners of the Youngstown Sheet and Tube Co., to operate the large coal area in Green County, Penn., recently purchased by the latter company. The new firm will be known as the Buckeye Coal Co., and it is the intention to start the manufacture of coke to be used in the plants of the Youngstown Sheet and Tube Co.

Martins Ferry, Ohio—Although many boats are still operating on the lakes, little coal is being shipped. As a result coal companies are contracting for vessels to be used for storage purposes during the winter. Operators figure that regardless of whether there is a suspension or strike next spring when the wage scale agreement is to be taken up, they will have a long shut-down to face. Accordingly, they are obtaining leases on boats and will load them this winter at the docks.

COAL TRADE REVIEWS

GENERAL REVIEW

Markets generally steadier as a result of the change in eather conditions. Anthracite stocks low and an active arket expected. Bituminous production curtailed. Prices ding steady to firm, but trade dull and shipments on conacts slowing up.

The customary order of business in anthracite has been eatly demoralized by the unseasonable weather, but lower mperatures the first of the current week had a steadying fect upon the situation. As a rule the market has been markably well maintained, but it was becoming evident at a continuance of unseasonable climatic conditions ould soon necessitate a curtailment in production, a most nusual procedure in hard coal at this period of the year. he final general adoption, by practically all the companies, an increase in the circular to cover the new Pennsylvania tate tax on hard coal, has put business on a more equitable asis. It is clear that stocks on hand are meager and it will ot take much cold weather to create an active situation.

The bituminous market continues listless, with an entire bsence of new business apparent on all sides, and the price st softening. The well stocked condition of consumers enerally has removed any fear of an immediate shortage, that contract demand is lighter. However, the situation by no means as serious as might have been expected, and is clear that operators are making the most determined ffort in the history of the trade to maintain prevailing rices. But in spite of the restricted production, coal is acumulating on track at a number of points, instances of emurrage are frequently reported, and even the good grades re occasionally in the market at reduced prices. These ases are more the exception than the rule, producers being enerally cautious about shipping except on specific orders.

The announcement of a receivership for one of the most owerful companies in the Pittsburgh district is evidence f the fact that better prices must be obtained for coal. Vhile the advent of cold weather promises to create a more ctive demand in that section, the market is quiet and not articularly well maintained; operations continue on about 60% basis, a large decrease from that previous to the losing of lake navigation.

A curtailment in iron and steel, and the decilne in general nanufacturing demand have restricted operations in Ohio and rice shading is now the rule all along the line.

The long continued warm weather also had a depressing ffect on the market, while at the same time materially failitating the movement. Lake shipments at Toledo for the eason, now definitely closed, exceeded all previous records. ome surpluses are accumulating at the Hampton Roads piers ut these are all well covered by contracts, and are only vaiting tonnage to move them. A remarkable record was nade by the Virginian Ry. in November, the movement exeeding that for the same month last year by over 100%.

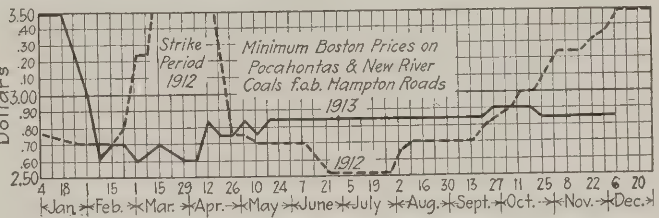
Business in St. Louis seems to have touched the bottom nd has not experienced much change in the past week, but he Chicago markets showed a decided slump. Consumers re restricting orders on contracts often canceling entirely r specifying deferred delivery. Mining operations are beng restrictel, and occasional congestions are reported in raiload yards.

EASTERN MARKET

BOSTON, MASS.

Bituminous market still inactive. Absence of inquiry for spot coal continues. Further decrease in offshore business, and government requisitions are fewer. Contract lemand less insistent. Georges Creek continues strong and in uniformly fair supply. Pennsylvanias are weak. Anthracite strong but momentarily affected by the warm weather.

Bituminous—There is no appreciable change in the market which is still listless. At Hampton Roads, with the exception of the Norfolk & Western piers, there is still an accumulation of coal in excess of chartered tonnage. This, together with the dissappearance of free coal from New England waters, the light government requirements and the decrease in the offshore business should tend to soften the market here. The New England consumers' well stocked condition and the absence on their part of any fear of an immediate shortage of coal have made contract demand lighter. However the circular price for Pocahontas and New River continues firm at $2.85 f.o.b.



The Pennsylvanias are, of course, affected, as far as tidewater shipments are concerned, by the above mentioned superabundant supply of the Southern coals. All-rail Pennsylvania shipments exhibit diminution on account of weather conditions and the plentiful supply of water power. Prices on these coals range from $1 to $1.60 f.o.b. mines.

Georges Creek continues to move regularly on contract and the price for any surplus of this grade is rather more than firm.

Quotations are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahonta New River
Mines*	$1.00@1.55	$1.25@1.60	$1.67@1.77	
Philadelphia*	2.25@2.75	2.50@2.85	2.92@3.02	
New York*	2.55@3.05	2.80@3.15	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@2.90
Boston†				3.72@3.82
Providence†				3.72@3.87

*F.o.b. †On cars.

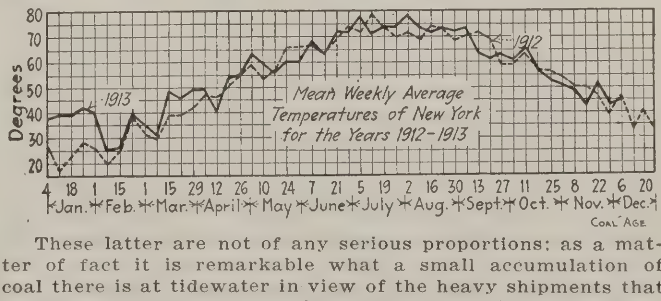
Anthracite—The postponement of the hoped for cold snap has caused a momentary quiescence of the market, the retailers having been unable to move but little of their stocks.

The marine freight market has undergone no material change. But few coastwise charters have been reported and shippers appear to be devoting their entire attention to providing for regularly chartered bottoms. Rates from Hampton Roads to Boston are 70 to 75c. per ton.

NEW YORK

Colder temperatures steadying up both anthracite and soft coal. Bituminous mining restricted, operators fearing to overship the market. Hard coal slow getting started, due to the backward season.

Bituminous—The New York market has been the last to feel the effect of the changed conditions in the soft-coal business, but the difference has been clearly apparent the current week in spite of the changed weather conditions. The slump is by no means of serious proportions, however, and the lower temperatures of this week will no doubt do much to steady things up. While lower prices are more frequently heard, this is, as usual, confined more particularly to certain tonnages threatened with demurrage.



These latter are not of any serious proportions: as a matter of fact it is remarkable what a small accumulation of coal there is at tidewater in view of the heavy shipments that have been coming down. Operators as a rule are cautious about shipping, except on specific orders, and as a result there is some slowing down of operations in the mining districts. It is clear that producers are making a more determined effort to hold prices than ever before in the history of the trade.

With the curtailed operations in the mining district, cars are now in plentiful supply, as is also labor. In view of the somewhat depressed conditions, we quote the New York market off 5c. all along the line from quotations for the past few weeks, as follows:

West Virginia steam, $2.60@2.75; fair grades of Pennsylvania, $2.70@2.80; good grades of Pennsylvania, $2.80@2.90; best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.15@3.25.

Anthracite—Conditions are rather quiet in hard coal, and supplies easy, in practically all sizes. Stove coal is as short as ever, but the situation is much easier, because the demand has dropped off; conditions are about the same on chestnut. Egg coal is in long supply and is the heaviest of any of the prepared sizes at the present time. Pea coal is active and in the best demand of any of the steam grades. As a rule, nearly all the upper port steam coals are difficult to move at the circular price, while the lower ports are flooded with the cheaper grade steam sizes. The line business continues the best feature in the anthracite trade.

As a rule business is slow in getting started this year, due to the unpropitious weather conditions, but the fall in temperature the first part of the current week will no doubt do much to relieve the situation in this respect. It is clear that stocks on hand are down to a minimum and the advent of real winter weather will create an active business immediately.

We now quote the New York market on the following basis, with prices usually steady:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	....	$5.05	
Egg	5.25	$5.10@5.25	5.30	$4.75@5.20
Stove	5.25	5.25@5.50	5.30	5.20@5.45
Chestnut	5.50	5.50	5.55	5.40@5.45
Pea	3.50	3.50	3.50	3.35@3.45
Buckwheat	2.75	2.70@2.75	2.45@2.70	2.00@2.70
Rice	2.25	2.25	1.95@2.20	1.80@2.20
Barley	1.75	1.60@1.75	1.70	1.40@1.70

BALTIMORE, MD.

Trade conditions are rather chaotic. Stoppage of call on contracts disturbs the market. Prices are weaker. Warm weather unfavorable.

That trade conditions in this section are unsettled is freely admitted. Considerable business is being done on contracts, and the export trade is gradually strengthening, but nevertheless there is a lack of new business apparent on all sides and the price list keeps softening. Curtailment of work by the steel and iron industry, the cement trade, and other lines of industry that touch the coal trade first is having a marked effect. A number of branches of business have stopped taking coal on contracts, while others that have relied on a certain amount of purchasing in the open market to supplement their contracts, seem to have dropped entirely out of the spot business for the time being.

In West Virginia prices are probably five to 10 cents off what they were a week or ten days ago. Low-grade steam coals were being offered in some mining districts at 80c. The gas market for run-of-mine is about on a par with this and three-quarter is quoted around 85 to 90 cents.

Pennsylvania line coals are selling uncertainly at prices ranging from 90c. to $1, and even the best grades are moving slow when offered as low as $1.30, mine basis. Many salesmen are being recalled from the road because new business is so poor as not to warrant the effort for the time being.

As outlined last week the hard-coal market is also unsatisfactory. Small yards are suffering most. There is plenty of coal on hand at local yards to meet the lightened demand.

PHILADELPHIA, PENN.

Changed weather conditions materially helped the hard coal business, and avoided the necessity of restricting production. Prices close to the circular and well maintained.

There has been a most welcome change in the situation in anthracite, in that the weather conditions, which have been anything but propitious, showed a change for the better. The week just past has done more to inject a little life into a situation which was rapidly approaching a mid summer condition, than anything that could have taken place. Dealers were becoming much discouraged, owing to the unseasonable temperature, and orders were slowly dwindling. This, of course, was effecting the operating companies, and it is safe to say that a week or two more would have meant curtailed mining, an unusual condition at this time of the year. October, November and December are generally looked forward to as being splendid coal distributing months, and the extension into the winter season of practically late Spring climatic conditions, has nearly upset the usual order of things.

As it is the anthracite market has held itself together in a remarkable manner. There has been no cessation of mining, and the output has, with few exceptions been taken care of. In fact, some of the companies were compelled to dip into their storage piles to supply the demand for certain sizes, notably pea and chestnut, but even these were getting easy at the close of last week. Rice coal seems to be about the only laggard, and the fact that bituminous is more easily obtainable, coupled with the fact that there is a slowly diminishing demand for rice coal in this market, doubtless explains this situation. The only satisfaction that the dealers have lies in the fact that, taking the years as a whole, there is always a certain amount of anthracite consumed, and what is left of December, together with January and February, will more than likely balance up the trade.

As to prices, the trade generally is now on about an equal basis. The general application of the state tax, either in the form of an additional price, or its equivalent, has put all operators on about the same basis, and trade that has been diverted into other channels owing to this difference, is likely to return. Anthracite prices rule as follows:

	Line and City Trade		
	Circular	Individual	Tidewater
Broken	$3.50	$3.60	$4.75@4.85
Egg	3.75	3.65	5.00
Stove	4.00	4.10@ 4.15	5.00@5.25
Chestnut	4.15	4.00@ 4.10	5.25
Pea	2.50	2.50	3.25
Buckwheat	1.50	1.50	2.25

The bituminous trade seems to continue along the lines of lower prices, and poor demand. New business is not easy to secure, and the output is being disposed of on old contracts. The inception of colder weather has not added the impetus to the bituminous market that was expected.

TORONTO, CAN.

Large stocks on hand and trade dull. New Pennsylvania state tax on anthracite added to retail prices.

Owing to the long period of unusually mild weather for this season, trade is rather quiet. Dealers have large stocks on hand in all lines, as since the close of navigation heavy shipments are being received by rail.

The increased freight rate of 5% on rail shipments via Suspension Bridge, which was announced to come into effect last month has been suspended until Mar. 12 next, and it is hoped that it may be further delayed.

The retail price of egg, stove and nut sizes of anthracite has been advanced from $8@8.25 per ton, and pea coal from $6.50@6.75, the reason assigned being the increased price at the mines, owing to the imposition of the Pennsylvania state tax on coal. Quotations for bituminous are unchanged.

BUFFALO, N. Y.

Still a strictly weather market. Too much coal everywhere. Sellers trying to hold prices, but find that there are a good many cuts made. Anthracite lake shipments concluded.

Bituminous—There is no help for the bituminous-coal market unless winter steps in and obliges consumers to buy. It is reported that large consumers, like the railroads, which commonly use a dozen or more cars a day at a single receiving point, are now taking only six or eight. This appears to be the rule with practically all concerns that are buying coal for heating purposes and even steam is made much easier than it would be if the weather was seasonable.

Meanwhile there is a steadily increasing accumulation of coal on track and the word "demurrage" that had scarcely been heard for a year, is again becoming common. It is a hard matter to get consumers interested in coal even where their jobber friends are trying to get tonnage off their hands. There are a good many strikes all through the bituminous fields but operators are rather inclined to welcome them, as the mines will not then turn out more coal than can be sold. The miners, on their part, are of the opinion that the producers are making too much money and are making all sorts of demands.

At present it is doubtful whether the summer prices can be held in any form much longer unless the recent cold snap steadies the market up. Jobbers report that they have given way, but operators deny this and say they are obtaining summer prices, at least after a fashion, and are of the opinion that former prices should continue. Quotations are at the moment weak on a basis of $2.90 for Pittsburgh lump, $2.89 for three-quarter, $2.65 for mine-run and $2.25 for slack, with slack rather firmer accordingly than sizes.

Coke—The coke market is not any stronger and promises to continue its former weak condition till there is a turn in the iron market. Dealers are finding a good many prices to contend with, as they seldom know whether the reductions are accompanied by corresponding cheapening of the product. Quotations remain weak on the basis of $4.70 for best Connellsville foundry, f.o.b. Buffalo.

Anthracite—The closing lake season finds that the an-racite shippers are not satisfied with the movement during e regular season, and are willing to pay extra insurance r December cargoes. During the first week in December ey shipped 67,500 tons by lake and another cargo will ing to their credit a round 5,000,000 tons by lake from this rt exceeding the previous record by more than a million ns.

The demand for anthracite is quite as slack as it is in the tuminous trade. There will also soon be as great a surplus, ough it will be easy to store it for awhile yet, as lake ves-ls can be loaded. Retail dealers are much discouraged over e situation and outlook.

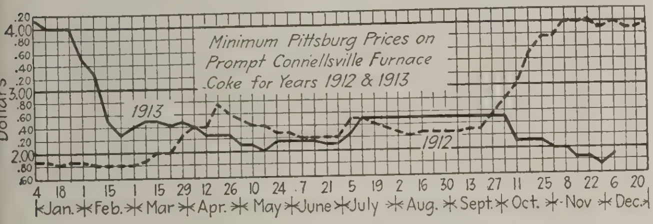
CENTRAL STATES

PITTSBURGH, PENN.

Receivership for prominent coal company. Market con-nues quiet with operations at the recently reduced rate of per cent. Prices fairly well maintained. Coke slightly wer, but buyers and sellers still far apart.

Bituminous—The receivership of the Pittsburgh-Buffalo o., secured Saturday, Dec. 6, by certain creditors, reflects in art some special losses which were incurred early in the ear by flood, but also in large part the fact that it requires onsiderable gross profits per ton of coal mined to carry the arge investments in plant and coal acreage demanded by resent mining conditions. The company has expanded rapidly n the past few years and for several months past it has een known that it was relatively short of working capital. t is generally expected that the receivership will protect the roperties and eventually restore the business intact to its wners. The move was precipitated by the fact that notes of he company were about to be offered at a discount. During he past year the operators of the Pittsburgh district have een endeavoring to secure better prices than formerly for heir product, and the present involvement of the Pitts-urgh-Buffalo Co. shows how well taken was the position hat a larger margin was requisite.

The market has been quiet the past week and prices have not been overly well sustained, though there has been no general cutting from the season list, to which the market lately declined from the premium prices put out in October. Manufacturing demand has remained relatively light, and so has domestic demand, but Sunday a near-blizzard visited the district and this week's domestic demand promises to be large. Operations continue on about the 60 per cent. basis estimated in last report, showing a large decrease from the rate before the lake season ended. We quote: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. steam, $1.50; 1¼-in. domestic, $1.55; per ton at mine, Pittsburgh district.



Connellsville Coke—Prompt furnace coke has been available at lower figures, even $1.75 having been shaded in at least one instance. There is little demand as shipments on contracts are usually ample. Negotiations on contracts for the new year are proceeding slowly, and buyers and sellers are even farther apart than is frequently the case. The majority of sellers retain the idea that they should secure $2 on furnace coke contracts, but there are indications that they are nearing a conclusion to depart from this figure. Other sellers are quoting down to $1.85 and occasionally this figure is shaded, as it is reported that one contract was closed for 5000 tons a month over first half at $1.75, the seller being a furnace interest not intending to operate its furnace for some time. Foundry coke is in fair demand. We quote: Prompt furnace, $1.75; contract furnace, $1.85; prompt foundry, $2.50@2.75; contract foundry, $2.50@2.75, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Nov. 29 at 344,108 tons, a decrease of 11,132 tons, and shipments at 356,785 tons, a decrease of 22,119 tons. The "Courier" figures have shown a net excess of shipments over production for many weeks past, which is not easily explained.

COLUMBUS, OHIO

Further weakness characterized the local trade due to the continued warm weather in all sections. The coal market now dependant absolutely on the weather. Recent cold snap will keep the situation from complete demoralization.

Operators and shippers generally made an effort to maintain circular prices but were not successful. Shading was the rule all along the line, and a large tonnage could not be moved at any price. Bins of dealers all over the country are full and consequently low quotations fail to attract them. Cancellations of orders placed some time ago have been the rule and in many cases consigned coal was rerouted after shipment. There was considerable demurrage coal reported at centers such as Chicago, Toledo, Cleveland and Detroit and which still further weakened the market.

The car supply is now all that can be desired, the closing of the lakes causing a much better supply. Eastern Ohio reports about 90 per cent. and the Pomeroy Bend district about the same. In the strictly domestic fields the car supply has been adequate and the same is true of the Hocking Valley. Shutting down of a number of iron and steel concerns has had its influence on the steam business. There is a noticeable decline in demand from many factories. Railroads are not taking as much as formerly as the freight movement has slowed up appreciably.

A most successful lake season for Ohio operators has come to a close. Only a small tonnage was loaded during the past week and since insurance is off, no more cargoes will be loaded. The reports of the Hocking Valley docks at Toledo shows that 2,719,958 tons were loaded during the season as compared with 2,328,963 tons for 1912 and 2,253,069 tons in 1911. In Eastern Ohio the increase was even more marked. Many of the larger operators increased their tonnage from 70 to 85 per cent. over the previous year.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$2.00 @ 1.85	....	$2.25 @ 2.15	$1.90 @ 1.75
3-4 inch	1.75 @ 1.70	$1.30 @ 1.20	2.00 @ 1.90	1.70 @ 1.60
Nut	1.30 @ 1.20	....	1.75 @ 1.65	1.30 @ 1.25
Mine-run	1.35 @ 1.30	1.15 @ 1.10	1.50 @ 1.40	1.35 @ 1.25
Nut, pea and slack	0.85 @ 0.80	....	0.95 @ 0.90	0.80 @ 0.75
Coarse slack	0.75 @ 0.70	0.95 @ 0.85	0.85 @ 0.80	0.70 @ 0.65

TOLEDO, OHIO

Long continued warm weather had a bad effect on the market. Circular well maintained despite slack demand. Movement good and cars plentiful.

Business in Toledo is quiet although the recent cold snap has had a beneficial effect. This section has rarely experienced such a steady run of warm weather at this season as has been the case this year. In some ways this has been a good thing as it has prevented congestion of railroad yards and given the roads a chance to get squared around following the rush of the sugar beet season. Cars are fairly plentiful now and most of the shipping troubles is due to yard congestion at some points and a lack of motive power rather than to a lack of equipment. However, there has been a car shortage reported until recently, railroads urging the hopper cars upon operators.

Despite the short demand prices have held fairly firm and are still being maintained very close to the list. While there are, of course, some sales below the circular, quotations have not broken nor show any indication of doing so. There is little coal left here on the docks as the amount shipped in seems to have been closely figured despite the extraordinarily heavy lake shipping this season. Steam coal is in fair demand.

Prices are as follows:

	Pocahontas	Hocking	Jackson	Pomeroy	Massillon	Pitts. No. 8	Cambridge
Domestic lump	$2.50	$2.00	$2.75	$2.25	$2.50	$1.50	$1.40
Egg	2.50	1.35	2.75	1.50	2.50	....	....
Nut	2.00	0.80	2.25	1.75	2.50	1.35	....
⅞ lump	....	0.90	....	....	....	1.30	1.20
Mine-run	1.60	1.50	....	....	....	1.20	1.20
Slack	....	0.70	....	....	....	0.80	....

DETROIT, MICH.

Heavy shipments coming in and coal is occasionally reported on demurrage. Dealers canceling orders or requesting that shipments be deferred.. Prices slump in spite of determined efforts to maintain the circular.

Bituminous—All jobbers feel that they will need coal when the heavy weather appears but they are, at the present moment canceling all orders possible or asking operators to postpone deliveries indefinitely. A great deal of coal is coming in and there have been instances where demurrage has been paid for as high as seven and eight days. The others bought domestic coals heavily during the car stringency and these are now in poor demand. Car supply is excellent at the moment but there is a feeling that this may be of short duration. Production in the Hocking and Pomeroy districts is about normal on both steam and domestic coal. Prices are shaded to move coal on demurrage and this has weakened the market all along the line, in spite of the strenuous efforts of the operators to maintain the circular. Hocking and Kanawaha domestic lump have both suffered a decline from their circular price of $2. Three-quarter lump which was quoted at $1.50@1.75 is now being offered at $1.15 while mine-run, which was held at $1.25 is down to $1 and slack is between 75 and 80c. per ton.

The following is approximately the market at the moment:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump	$1.50	....	$1.50	....	....	$2.50	$2.50
Egg	1.50	....	1.50	....	....	2.50	2.50
Nut	1.30	....	1.30	....	....	....	....
Steam lump	1.20	....	1.20	....	....	....	....
¾-in. lump	1.10	$1.15	1.00	$1.10	$1.10	....	....
Mine-run	1.00	1.00	1.00	1.10	1.10	....	....
Slack	0.76	0.85	0.65	0.75	0.75	....	....

Anthracite—Stove coal is short and is commanding a ready premium in this market. Other grades are coming in freely.

HAMPTON ROADS, VA.

Dumpings for the week fair. Coal shortage somewhat improved. Accumulation of coal at tidewater about normal.

The dumpings from tidewater piers for the week have hardly been as heavy as was expected. The movement both foreign and coastwise will be considerably behind the figures for the first week in December.

With a number of large government colliers due in the next few days, some shippers are accumulating coal at the different piers, and while there may appear to be a surplus at tidewater this is really not the case as the coal on hand is practically all contracted for and only waiting tonnage to move it. However, a few shippers have some free coal. Prices during the week have ranged from about $2.85@3, which is about the same as has been in effect for some weeks.

The Virginian Ry. ran a close race with the N. & W. for dumpings for the month of November, falling behind the latter road only about 5000 tons. At one time during the month the Virginian was considerably in the lead. The total dumpings of the Norfolk & Western were 345,727 tons, the Virginian 340,769, and the C. & O. at Newport News, 207,778 tons. The Virginian's dumpings is a record for that road, and is nearly one hundred per cent. over their November, 1912, figures. The N. & W. figures, however, are about 1500 tons behind their November, 1912, dumpings. The Norfolk & Western would have been considerably heavier had they not been hampered by having a large number of their coal cars tied up in the congestion on the various Western roads.

LOUISVILLE, KY.

Dullness prevails in both domestic and steam business. Mild temperatures up to the current week delayed consumption. Stocks heavy but prices are holding moderately firm.

The market is governed entirely by weather conditions which, up to the current week, were strongly adverse to an active trade. As the result, stocks are abnormally heavy and the volume of business is much below that customary at this period of the year.

An incipient car shortage is still being felt, eastern Kentucky mines having been idle for two days last week from this cause. However, this is of little consequence because of the flat market, but with the change in the weather conditions this week, the possibility of a continued shortage is regarded with anxiety. The light demand has effected a further decline in prices, but such declines do not represent the real market as operators appreciate the futility of attempting to force buying by abnormal cuts. Eastern Kentucky block of the better grades can be had at $2.15 a ton, as compared with the top price a few weeks ago of $2.50. Block and lump are rather slow at around $2, and round is worth $1.65@1.75. Better grades of nut and slack are offered at 75c.

SOUTHERN AND MIDDLEWESTERN

BIRMINGHAM, ALA.

Coal market quieter than for several months. Blacksmith coal normal. Furnace and foundry coke dull. Car supply still inadequate.

The market on steam coal is quiet, and some stock is accumulating on track, which is unusual for this season of the year. While business is slow, prices are remaining about stationary. Domestic coal is dull, due to the continued warm weather, and while the regular schedule on the higher grades is from $3 to $3.25 per ton, some interests are offering domestic lump as low as $2.75, while one interest has offered spot shipment at $2.50. This condition cannot last long, however, and all operators believe that the next few days will see a decided improvement in both steam and domestic business. The usual holiday rush orders have not yet come in, and, as the mines usually close down for several days during the holidays for lack of labor, operators are looking for a brisk demand for the balance of the year.

Blacksmith coal is moving in about its normal tonnage. Both furnace and foundry coke are quiet, though some tonnage of foundry coke is moving regularly Although some recent articles have stated that Birmingham iron is offered at $10 f.o.b. Birmingham, this is in error. While the market is very dull, and only a small tonnage being booked, the prices are from $11 to $11.50 per ton basis 2F f.o.b. Birmingham, the manufacturers believing that the price will go higher instead of lower. The car supply is still short of the requirements, especially on some of the large contracts, which require a heavy daily tonnage to move regularly.

NEW ORLEANS

Warm weather takes life out of city market. Texas orders fall off. Bunker trade shows decrease. Plan to bring Alabama coal by water proves failure for present.

A stagnant conditions of the city coal market has resulted from the continued warm weather and is responsible to a great extent for the unusually large stocks being carried at this time of the year. Demand from other sources has been light during the past week. Bunker business has been slow while the demand from western Louisiana and eastern Texas is falling off. The only activity in the week's business was the filling of several orders for Latin America.

The local market is being affected adversely by the increased practice of European-bound ships to take only a portion of their coal supply here. By taking aboard a supply sufficient to reach Norfolk, considerable additional cargo space is provided. This is more than offset, however, by the increasing number of direct sailings to South and Central American ports.

So far as the first barge load of coal from the Alabama field is concerned, the experiment is an abject failure. The cause, however, does not reflect on the fundamental ideas of the plan. Failure on the part of the government to complete the locks at the time specified, makes the navigation of the Warrior and Tombigbee Rivers practically impossible for a loaded barge. A year at least must elapse before the locks are completed during which time the expensive handling machinery must remain idle.

CHICAGO

Marked slump in the Chicago trade, due to continuation of warm weather and a recession in general business conditions. Shipments are curtailed and operators are reducing their output. Many orders are being canceled and requests for delayed shipments are frequent. Demand for anthracite is small. Coke market dull.

Continued warm weather up to the present week, and a general slackening in business conditions has produced a decided slump in the Chicago market. Dealers complain that sales of domestic coal have fallen off in a marked degree and in the steam-coal trade there has been a substantial decline in the volume of orders.

Market observers declare that a sharp recession in production is necessary to prevent a general slump in prices. The storage capacity of a majority of the retail dealers is taxed to the limit and many of them have ordered more coal than they have room for. Many canceled orders and requests to delay shipments have been reported. Some operators who sold coal at $2 or better have had all unshipped orders canceled within a few days.

There is comparatively little demand for anthracite coal and a number of all-rail shipments are now subject to demurrage charges. No changes in the price list have been noted, but sales are light. The price of smokeless mine-run is being held at $1.40 by the larger producers, who are cutting down shipments as much as possible. A small amount of off-grade fuel is being moved, but practically no free coal is reaching the Chicago market. Some of the large smokeless buyers are making an attempt to drive the price of mine-run to $1.25, but so far their efforts have not been successful.

Shipments of Hocking coal are also being curtailed. Smaller shippers have been forcing sales at sacrifice prices, in some instances as low as $1.50, the mines. Operators in the Springfield district are handling steam coal on contracts chiefly, and devote little attention to domestic business at present. Prices for domestic lump range between $1.35 and $1.50. Indiana domestic sizes vary between $1.40 and $1.50. There has been a slight improvement in screenings, but the olume of business is far from satisfactory. Carterville perators have been reducing their shipments and lump and gg sales range from $1.50 to $1.75, the mines. Franklin ounty lump and egg are down in price to between $1.50 and 1.75. The coke market is soft.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
omestic lump	$2.17@2.32	$2.55@2.80	$2.12@2.27	
team lump	1.92		1.97	
gg		2.55@2.80		$4.20
ine-run	1.87	2.40	1.87	3.45
creenings	1.12	1.70	1.27	

Harrisburg—Domestic lump and egg, $2.55@2.30; steam ump and mine-run, $2.25; screenings, $1.55; No. 1 nut, $2.55@ .80; No. 2 nut, $2.55.

Carterville—Lump, egg and No. 1 washed, $2.55@2.80; No. washed, $2.55.

Coke—Connellsville, $5.25@5.50; Wise County, $5@5.25; yproduct, egg, stove and nut, $4.90@5; gas house, $4.75@ .95.

ST. LOUIS, MO.

Market unchanged but more seasonable weather condiions will have a beneficial effect. Demand satisfied at the oment and some mines closing down. Large accumulations f coal.

Continued warm weather has brought about no change in he market. However, this week started off inclined to be ore favorable to the coal trade, and from now the situation hould improve. Conditions are much the same as reported ast week, with the exception that what little demand there was at that time has long since been taken care of and several operators found it more economical to shut down than to continue producing.

Retail yards are still piled up with storage coal, and railroad yards at all diverting points are loaded to capacity with unbilled coal. The screenings market started the latter part of last week to get into its own again, those in the Standard field advancing as much as 10c. in one day. They are still bringing better prices and this condition will likely continue now for some time.

There seems to be plenty of cars on the big coal carrying roads, but the Southern and the M. & O. are in bad shape and the Wabash is about the same. There is no coke market, no demand for anthracite, and no inquiry at all for smokeless.

The prevailing prices are:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	$1.00*
3-in. lump	....	....	$1.40*	....
6-in. lump	$1.30 @ 1.50	....	1.50*	1.20*
Lump and egg	1.85 @ 2.15	....	....	....
No. 1 nut	1.40 @ 1.60	....	....	....
Screenings	0.40 @ 0.50	....	....	....
Mine-run	1.10 @ 1.20	....	....	....
No. 1 washed nut	1.75	$2.25	1.40	....
No. 2 washed nut	1.35	....	1.60	....
No. 3 washed nut	1.15	....	....	....
No. 4 washed nut	1.05	....	....	....
No. 5 washed nut	0.50	....	....	....

* Asking price.

INDIANAPOLIS, IND.

Teamsters' strike has cut off domestic deliveries. Mild weather reduced running schedule of mines about one-third. Plenty of cars. Isolated cases of price shading, but general tone firm.

Mild weather and the teamsters' strike in this city continue to be the chief influences in the coal industry. The strike had little effect on the factory consumption, but it stopped the delivery of coal to domestic users. The net results during the disorder were about one dozen killed and wounded, and as much excitement centered around efforts to deliver coal as in all other lines combined. The disorder would have been much worse had not the police been well organized and had the assistance of about 3000 special police made up largely of employers and loyal employees. No rioting lasted more than long enough to give the police time to reach the scene in speeding autos. Only two or three dealers attempted deliveries, and these were few. The general policy of employers was to stop business, awaiting the end of the trouble. The strike was declared in effect Sunday midnight. There had been a great rush of deliveries in anticipation, the bustle extending through Sunday up to the hour for striking.

The mild weather is a depressing influence throughout the state and has cut down the running time at the mines about one-third. There are plenty of cars, now that they are not badly needed. Reports are heard of cut prices here and there, but the operators in general hold firm. There is little use in lowering prices, they say, when consumers have their bins full. The standard price for screenings is 60@65c., mine-run $1.25@1.35; steam lump, $1.45@1.55; domestic lump, $1.90 @2. Retail prices in this city hold at the basis of Sept. 20, when the winter rates went into effect.

The average temperature recorded in the Indianapolis bureau for November was 47.6 deg., and this was a fair index of the weather generally over the state.

KANSAS CITY, MO.

Operations being restricted due to warm weather. Market remains steady though dull. Colorado strike not affecting the local situation.

Rain and warm weather have failed to form a favorablle combination in Kansas and Missouri and business has been at a low ebb during the past week. Most of the operators are working on part-time basis, being unable to keep their plants in continuous operation under present conditions.

The market has been steady in most cases, despite the lull. The Denver situation is having no bearing on conditions in Kansas City. Reports from Denver recently were to the effect that a shortage in coal is prevailing there. However, there is plenty of coal being mined in Colorado, and there is little or no probability of Kansas coal being shipped into Denver or other Colorado points as a result of the strike. The only possible result is a heavier shipping to western Kansas, should the Denver disagreement be prolonged.

OGDEN, UTAH

Only colder weather will bring renewed activity to the coal market. Surplus of nut at mines causes drop in quotations. Car supply sufficient to handle present shipments. Strike situation in Colorado not improved.

All the mines in Wyoming and Utah have been keeping up on their shipments and making efforts to stimulate the market. Mild weather continues throughout the territory and coal is moving slowly. Many standing orders have been reduced or canceled. This light demand for coal has caused a surplus of nut at the mines and there seems to be no market for this grade. Nut is a summer coal and there is little call for anything except lump at this time of the year.

A few salesmen still believe that a cut price will move a surplus of coal on the stagnent market and consequently this grade has been offered below quotations. This method might bring temporary relief in some cases with other grades of coal, but nut coal is sold entirely to retail dealers who buy a car at a time and only when they have sufficient orders in sight to handle same. The cut price may induce the dealer to order a few days before he intended to, but it does not increase the sale of this grade.

The ideal fall weather has allowed the railroads to handle coal shipments in record time, which has been one item effecting the car supply. Cars are plentiful and there is no indication of a shortage.

Shipments to Nebraska and Colorado from the Wyoming mines continues slightly above normal, except for nut coal.

Quotations remain unchanged as follows:

	California	Colo. & Neb.	General
Lump	$3.00@3.50	$3.25	$2.75
Nut	2.50@3.00	2.50	2.25
Mine-run	1.85	1.85	1.85
Slack	1.00	1.00	1.00

PORTLAND, ORE.

Report that railroads may take advantage of reduction in duty on foreign coal by purchasing from mines in Canada. Strike there has reduced output and considerable coal has been shipped from this side into British Columbia.

It was reported here this week that railroads in this part of the country have been investigating the possibilities of importing coal from British Columbia. It is understood that instead of quoting the price, minus the 40c. per ton duty, the miners were not inclined to make more than a 30c. reduction. It has been impossible to verify the report at this time.

It was recently announced that the Boston Pacific line will inaugurate regular fortnightly steamship service between Boston and ports on the Pacific Coast, including Portland, as soon as the Panama Canal is thrown open for commercial traffic; and in this connection it has also been announced in a private telegram, on what appears good authority, that the canal will be open and ready for business in April or May of next year, about ten months earlier than former reports have indicated. To begin with eight steamers, representing a total carrying capacity of 50,000 tons, will be placed in commission, two of them now being built at Boston, each of 9000 tons carrying capacity.

The coal market here at present is without change, as to prices, but as the winter advances the demand for domestic purposes is becoming keener. So far the weather has been against heavy consumption throughout the Pacific Northwest.

FINANCIAL DEPARTMENT

St. Louis, Rocky Mountain & Pacific Co.

Under date of Aug. 1 Pres. J. Van Houten sent out a circular which we abstract as follows:

Agreement to Sell Railway Property to Atchison Topeka & Santa Fé

The mortgage securing your bonds is a first and direct lien upon all of our coal properties, coal mines, mining and coking plants, which constitute the principal security for your bonds (and will so remain), and is also a lien upon the stock and bonds issued by the St. Louis Rocky Mountain & Pacific Ry. Since the execution of the mortgage, the company has purchased further coal land and rights, has opened and equipped four additional mining plants (making five in all) and one new coking plant (making a total of two), all of which new property has come under the lien of the mortgage. These additions and improvements have increased our capacity from about 1500 tons daily in 1905 to from 7000 to 8000 tons, and a present actual daily coal production of 5000 to 6000 tons.

The railway has 106 miles of main line of standard gage, well built and maintained, with 523 freight cars, 2 passenger cars 2 combined passenger, express and baggage cars and 7 locomotives. It does not enter directly any of the markets for the company's fuel, except local points of small importance, and the divisions of through rates which it has been able to obtain are so small, owing to the short haul, that it has not been a paying proposition. In fact, there has been a considerable and increasing annual deficit which has had to be provided for out of earnings from the coal business. Under the present laws, discrimination, either as to rates or service, is practically impossible; hence, the control of the railway by this company gives no advantage which we would not otherwise enjoy. Moreover, we actually suffer a disadvantage in times of car shortage on account of the limited equipment of the railway.

Heretofore, notwithstanding the large annual deficit of the railway, which during the past six years has caused a loss to the company in interest on the railway company's bonds and in money advanced for operating expenses amounting to $900,000, this company has been able not only to provide for this deficit and meet its own expenses, taxes and fixed charges promptly, but has also accumulated a substantial surplus from earnings of the coal business the greater part of which has been reinvested in the extension and improvement of the coal properties.

After a careful consideration, the directors have decided that the company should go out of the railroad business and devote all its resources to the enlargement of its fuel business. The company accordingly has negotiated an agreement whereby the railway stock and bonds or the railway property may, upon release of said stock and bonds from said lien, with the consent of bondholders, or, if necessary, through foreclosure of the mortgage upon the railway, be disposed of to the Atchison Topeka & Santa Fé Ry. Co. for the consideration mentioned in the inclosed agreement. Such disposition will bring four decided advantages for this company's bondholders: (1) A valuable asset readily convertible into cash and bearing a regular return in place of the nonproductive stock and bonds disposed of. (2) The assurance of ample transportation facilities at all times and the active coöperation of a great railway in the promotion and extension of our fuel business. (3) Freedom from embarrassment in the future should Governmental legislation compel the disposal of the railway without possibly giving adequate opportunity to make favorable terms. (4) The proceeds of the property to be disposed of will be used for your benefit either by retiring a large amount of the company's outstanding bonds, or else the securities received as part of such proceeds will be held by the trustee subject to the lien of your mortgage.

Present Mortgage to Be Closed Except as to $1,000,000 Available for Future Coal Developments, Etc.

Under this company's present mortgage, additional bonds amounting to $6,301,000, par value, are authorized and may be issued for railway purposes. It is proposed so to amend the mortgage that upon the disposal of said railway stock and bonds or of said railway, the authority to issue such additional bonds will terminate. The mortgage securing your bonds will thereupon become substantially a closed mortgage, as no further bonds could be issued thereunder, except not to exceed $1,000,000 for developing and improving the coal property.

Sinking Fund to Be Inc'd from 1c. to 3c. a Ton, to Retire Bonds by Maturity

The company proposes also to increase its sinking fund payments to 3c. per ton of coal mined each year instead of 1c. per ton as now. Considering the constantly increasing business and that a large amount of outstanding bonds will be retired as a result of the disposal of the railway property, it is believed that the proposed annual payment of 3c. per ton will be adequate to retire the entire bonded debt at or before maturity.

COAL SECURITIES

The following table gives the range of various active coal securities and dividends announced during the week ending Dec. 6.

Stocks	Week's Range High	Week's Range Low	Week's Range Last	Year's Range High	Year's Range Low
American Coal Products	83	83	8 3	87	80
American Coal Products Pref.	..	..	105	109¼	102

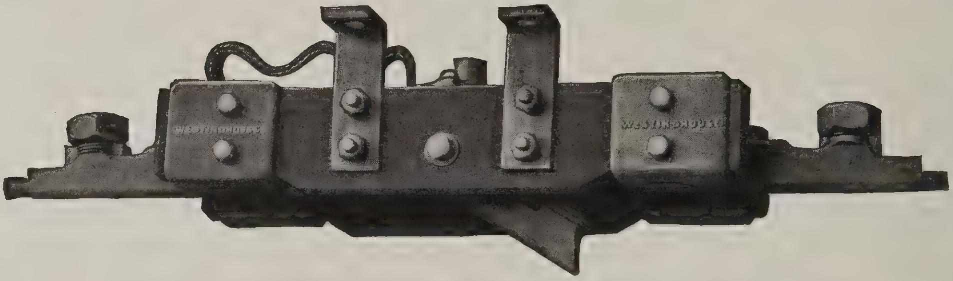
Cutting Band of Slate from Middle of a Coal Seam

Westinghouse
Line Material for Mines



Automatic Section Insulator. When locomotive passes into section where this insulator is used, the line is automatically energized; current is turned off when the locomotive passes out.

THE Westinghouse Electric and Manufacturing Company manufactures not only a complete line of suspensions, ears, splicers, insulators, rail bonds, pole line hardware, and other line material for outside work, but also special devices designed particularly for mine work.

The insulating material used is made at our East Pittsburgh Works. It is moisture-proof, heat resistant and of high mechanical and dielectric strength. It is moulded into shape under great pressure, so that it is very dense and capable of resisting heavy strains.

All malleable-iron and steel parts are sherardized, absolutely preventing oxidation.

The Weekly Ad-Talk Page

What have you bought through the advertising pages of Coal Age?

It's a long time since we have asked any questions and we sometimes wonder if all the little talks which appear on this page accomplish all we hope they do.

The advertising pages of Coal Age contain the business messages of concerns which make things you can use to advantage in coal mines.

The ads no longer shout in big bold-face type the name and address of the advertiser but tell why the advertised goods should be bought.

In a great many instances the advertisers offer to ship their goods on trial.

In others, working samples are offered. In every case the advertisers put their propositions before you in a straightforward businesslike way, no ifs, ands or buts, no calling on the imagination, no exaggerated claims, no knocks.

Now, are you taking full advantage of the opportunities for improvement held out by the advertising section?

Are you using the ad pages for all they are worth?

Does the vast improvement in advertising in technical paper advertising mean all it should to you?

Are you buying goods for your plant from the selling section?

What have you bought in this way?

Write us a letter telling what and why—we will publish it on this page and pay regular space rates for anything we use.

Extracts from the Coal Age Advertising Code

1 No misstatement of any kind can appear in the Coal Age.

2 No gross exaggeration can appear.

3 The name or address of a competitor cannot be mentioned in an advertisement.

4 No advertising of any product (or services) that cannot be used to advantage in a coal mine can be inserted in the Coal Age.

5 We reserve the right to refuse the advertising of any concern, if in our judgment the product is not ready to be marketed, or if the would-be advertiser is not financially able to continue advertising long enough to make his investment worth while.

Christmas in a Mining Town

By Berton Braley

Written expressly for Coal Age

Christmas in a mining town—dreary sort of time,
  Snow is rather dingy and the hills look bare,
Life is just the baldest prose—not a bit of rhyme,
  Scarce a sign of Santa, though he should be there;
Children in the miners' homes whisper in the night
  "Tell us he is comin', say it ain't no fake!"
Well, sir, will you turn away, hold your money tight?
  Or will you loosen slightly for a small child's sake?

Christmas in a mining town—life is pretty hard
  Many is the hovel where the cupboard's bare,
Mothers toil unceasingly—this is their reward
  To meet the Christmas season with a face of care;
Well, sir, will you turn aside, clutching tight your roll,
  Or fill a portly basket as a good sport should?
Charity's a joyous task—soothing to the soul,
  Why not try it, brother?—Ah, I thought you would!

Christmas in a mining town—money's not enough,
  Give some love and kindness and a heart of cheer,
Help to smooth the pathway, where the going's rough,
  Give your songs and laughter—let them ring out clear!
Brighten up the dreary homes where the lives are gray,
  Frolic with the children till they shout with glee,
Christmas in a mining town—make this holiday,
  Something like the Christmas that it ought to be!

A New Type of Coal Cutter

By C. E. Warbom*

SYNOPSIS—A machine which cuts a 15-ft. room to a depth of 8 ft. without being unloaded from its truck. Since the cutting is done in a shale parting, which may then be entirely removed, no "bug dust" is made and the coal is secured clean from slate.

⁂

A novel and economical type of coal-cutting machine has been recently placed on the market by the Jeffrey Manufacturing Co., Columbus, Ohio. This is known as the Jeffrey-Drennen adjustable-turret coal cutter, and was designed by the Jeffrey company's engineers at the request and with the coöperation of Everett Drennen, manager of the Consolidation Coal Co.'s mines in the Elkhorn Division, to meet certain conditions existing there, also to enable the mining company to economically produce coal and increase the quality thereof.

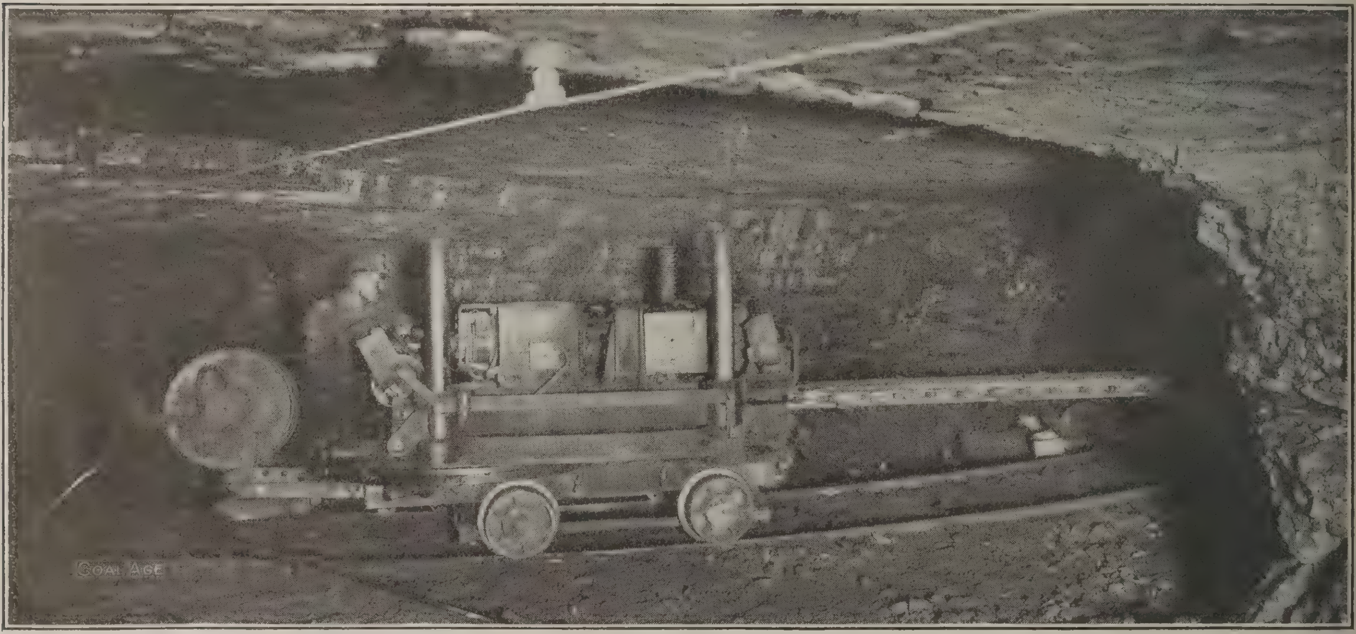
The coal seam at Jenkins, where the mines are located, varies from 6 to 8 ft. in thickness. It is clear, bright and free from sulphur or other impurities with the exception of a band of shale located at a height of from 2 to 5 ft. from the bottom. This varies in thickness from nothing to 19 in.

With the customary methods of undercutting it would be impossible when shooting to prevent this shale from becoming mixed with the coal, but by the use of a machine adapted to cutting out or removing this parting before the coal is shot down this difficulty is overcome.

How the Machine Is Built

The machine is mounted on a turntable truck, which carries four heavy standards or uprights, on which the machine proper is raised or lowered or adjusted to the desired height at which to cut out the dirt seam. The cutter is designed for a minimum height of 2 ft. from the bottom, and can be adjusted to cut at any position between 2 and 5 ft. The raising or lowering of the machine is accomplished by power through a disk friction clutch, which enables the operator to absolutely control the elevation of the machine to a nicety, 3 ft. of a vertical movement being accomplished in about 25 seconds.

A cable reel is provided which automatically reels up or unwinds the cable as a room is entered or left. The machine is arranged for self-propulsion and has a maximum speed of 350 ft. per minute; the rapidity of travel being controlled by the operator through a disk friction clutch, thus enabling him to run at any desired speed from nothing up to the maximum. This is a great advantage in going over frogs and switches since it minimizes the danger of derailment and consequent delay.



The Machine Entering a Room

The overall dimensions of the machine are as follows: Width, 5 ft.; length with 8-ft. cutter bar, 17 ft.; height, 5 ft. 6 in.

It has been found that by cutting the coal seam in the center it requires only two small shots for the top and two for the bottom bench, which lessens the danger of damaging the roof, and practically eliminates blowouts. The machine has been the means at these mines of giving a cleaner product, more rapid cutting at less expense per ton, and a much safer method of mining coal.

The entries in these mines are driven 10 ft. wide and the rooms 15 ft. wide. The operation of cutting is as follows: When the machine is moved into the room, an anchor hole $2\frac{1}{8}$ in. in diameter is first drilled in the coal under the band to be cut, and about on line with the left-hand rail; an anchor is fitted into this hole, and the feed rope attached. The machine is then turned on the turret by hand toward the right rib, making an angle of about 15 deg. with the track where it is automatically locked.

---

*Engineer, Columbus, Ohio.

The machine is then started and pulled toward the face, forcing the cutter bar into the coal to a depth of about 8 ft. When the cutter bar has reached its full depth in the coal, the feed rope is attached to an extension arm, which is securely bolted to the lower part of the truck, the rope being taken around a sheave and the end fastened to the machine proper. With this hitching the cutter bar is swung across the face, the speed being about 32½ in. per minute at the extreme end of the bar.

The cut across the face is complete when the bar stands at an angle of about 20 deg. to the left of the track, where it is again automatically locked. The feed rope is then carried to the machine over proper sheave wheels and attached to a jackpipe set about 20 to 30 ft. from the face, between the track and the left-hand rib.

The feed is then started and the machine with its truck pulled backward, cutting the left-hand rib as the machine leaves the face. When the cutter bar is clear it is swung into a central position, the machine lowered, and the self-propelling gear thrown in. It is then in readiness to proceed to the next working place.

Cutting Is All Done in the Shale

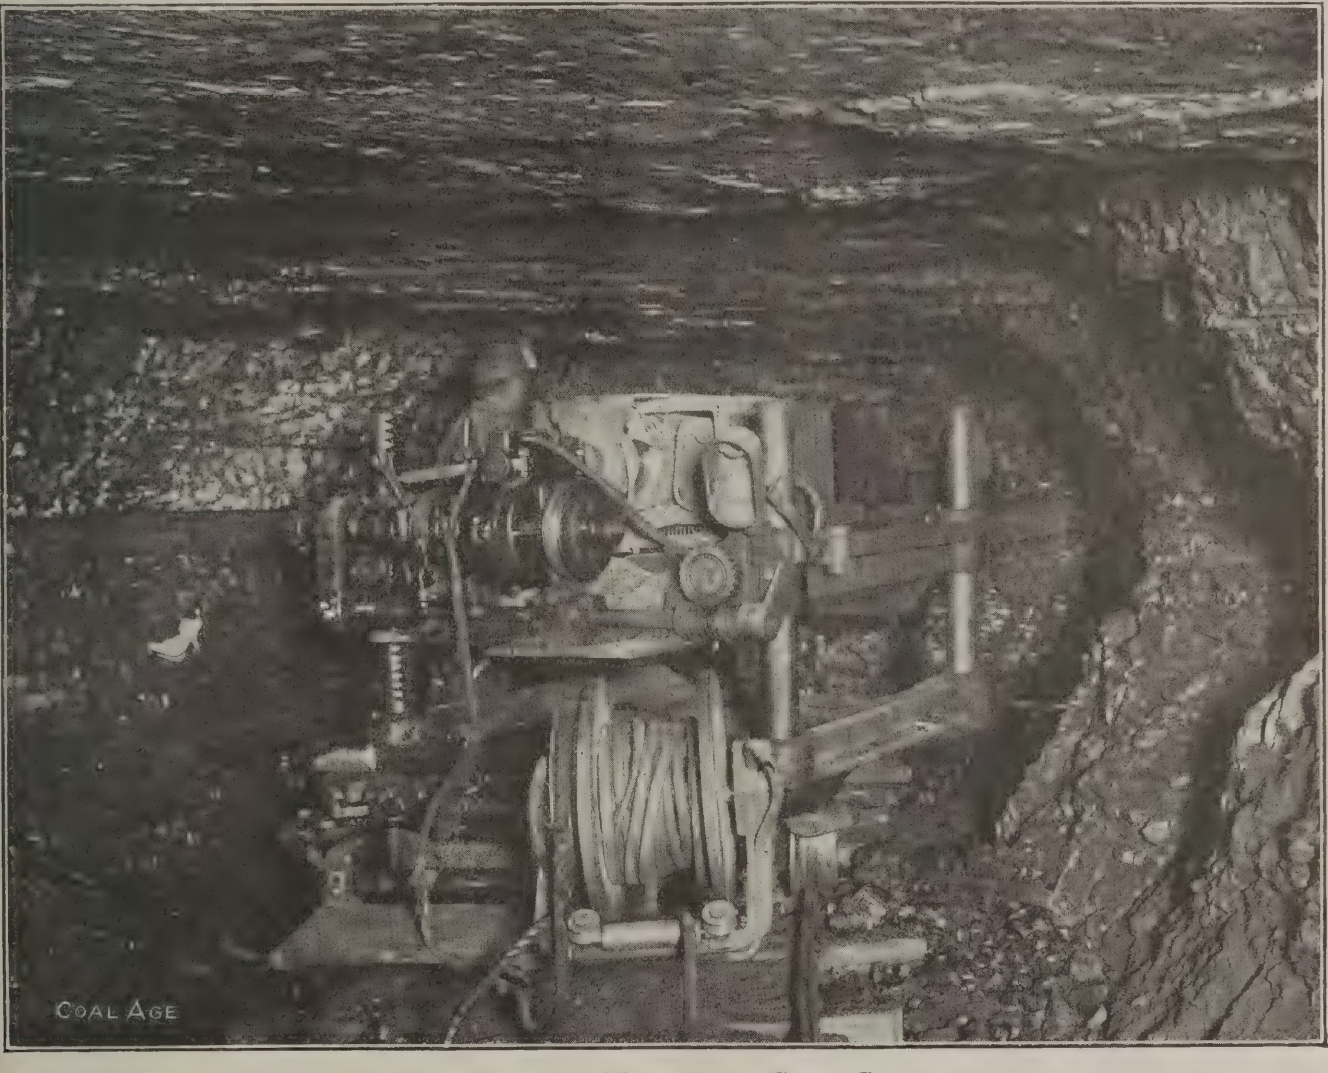
The cutting is done in the shale at the bottom of the band with the lower nose of the bits cutting into the coal about ¼ in., which causes the shale to fall down in the kerf, after which it is cleaned out, loaded in cars and hauled out of the mine. This insures an absolutely clean product.

Some idea of the performance of this machine can be obtained when it is considered that a 15-ft. place can be cut in 11 minutes from the time the machine enters the room until it is ready to leave. Twenty-five rooms have been cut in a shift of 10 hours. Since the installation of the first machine some eight months ago, the above company now has in operation 26 of these cutters.

Recently there have been numerous suggestions for a safer method of coal mining, especially in localities where the roof is faulty. Several coal companies have adopted the method of cutting the coal in the center, the object of this being to minimize the danger of blownout shots, and to lessen that of damaging the roof, also to secure increased production at lower cost.

The accompanying illustrations, together with the front cover of this issue, show the machine in various stages of the work and cannot fail to convey a good idea both of the make-up of the apparatus as a whole and the method of its manipulation.

It may be readily perceived that a machine so arranged as to require no unloading from its truck with the time losses incident thereto, has a great advantage over those of other types.



The Cutter at Work in the Shale Band

Banquet of West Virginia Coal Mining Institute

The banquet of the West Virginia Coal Mining Institute was held in the Hotel Kanawha, Charleston, W. Va., on Dec. 9, after the conclusion of the winter session. The hosts were the local mine operators. Considerably over 100 persons were present and the after-dinner speeches were exceptionally good. Joseph Holt Gaines, the ex-congressman, was toastmaster, and proved exceptionally witty.

Neil Robinson, mining engineer, Charleston, W. Va., delivered "Reminiscences of the New River Field"; Dr. I. C. White, state geologist, spoke on geology; E. W. Parker, statistician of the Geological Survey, discussed the need for having an organic union between institutes; Carl Scholz urged the claims of the American Mining Congress; Fred Paul Grosscup called on the operators to support the Panama-Pacific Exposition; Judge Ira Robinson testified to the value of industrial enterprises in building up the state of West Virginia; Fred Blue, state tax commissioner, declared that West Virginia had the lowest taxes and best system of handling its money in the United States; Fred Stanton spoke for the banking interests and Dr. J. E. Beebe wound up the speechmaking with a short but lively address, complaining that the bankers, politicians, geologists, statisticians and judges had told the coal men what they should do while the coal interests themselves were silent and were not offered a chance to reply.

⁂

The Kentucky Mining Institute

Judge H. S. Barker opened the Kentucky Mining Institute at 1:30 p.m., on Dec. 8, 1913, with an address of welcome on behalf of the State University, of which he is president. In the course of his remarks he urged the operators to use their influence and money in extending the duration of the school sessions in their mining villages and emphasized the value of subordinating legal rights to human needs. At least one company in Kentucky is providing one-half the cost of extending the school year, the other half being paid voluntarily by the employees.

W. L. Moss, the president of institute, responded in the briefest possible manner. Then R. D. Quickel read what might be well termed the strongest paper of the meeting. Mr. Quickel is fuel agent for the Cincinnati Southern Ry., and his subject was the "Clinkering of Mixed Coal under High Temperatures." Then followed "Problems Encountered in Mining Coals in the Western Coal Field of Kentucky," by Newell G. Alford, assistant engineer of the St. Bernard Mining Co., Earlington, Ky., a good article, if not quite equal to many others he has written. Prof. C. J. Norwood then read an article by W. C. Whitcomb on "The Use of Gasoline Motors in Coal Mines," a conservative appreciation of the value and use of such locomotives. Thomas Robinson read a paper by Dr. S. R. Collier, of West Liberty, Ky., on the "Oil Fields of Northeastern Kentucky," and Prof. W. E. Freeman, of the State University, read a paper on "Safeguards in the Use of Electricity in Mines." Otto A. Rothert, the historian of Muhlenburg County, talked interestingly on "The Bearing of Coal Mining on Local History," showing how early was the development of the West Kentucky field.

Senator J. E. Bosworth, of Middlesborough, Ky., was not present, so E. B. Wilson delivered an address on "The Old and New Way" of mining coal, illustrated by some 60 slides.

The Summer Meeting

A resolution supporting the Foster bill in Congress, which aims to provide national aid to mining schools for educational extension and investigation, was passed unanimously. The next meeting will be held at Lexington, probably in accord with the constitution, on the second Monday in June. There has been some disposition to violate the provisions of the constitution and to meet at the winter session in some other place than Lexington. It seems a pity, however, to hold the winter meeting in the mining districts, for the weather is then usually unsuited for traveling around the mines. If the constitution is to be amended or broken it should be done for the purpose of transferring the *summer* meeting to the coal-mining regions.

The Smoker

The evening session of the Kentucky Mining Institute was a smoker in the Hotel Phoenix, tendered by the Mining Society of the College of Mines and Metallurgy. The meeting was opened by President Moss, but as he had to leave on an early train, the chair was later occupied by B. F. Hutchcraft. At the suggestion of W. L. Moss, T. J. Barr opened the discussion by a statement of the difficulties in deciding what constitutes a "mine accident"? when is a death in the mines to be listed as a "fatal mine accident"? what constitutes a "serious mine accident"? and what accidents should be reported for the mine inspector's record?

What Is a Mine Accident?

Mr. Barr instanced the deaths at the Taylor shaft. Several men went to an abandoned coal pit to see whether the water being drawn away from the neighboring mine had any effect on the water in the shaft. One man became asphyxiated by the bad gas in the pit and was drowned. Those who attempted a rescue suffered the same fate. Mr. Barr stated that as the shaft was completely abandoned the question arose: Was that occurrence classifiable as a mine accident?

Some injuries, properly attended to, would not result in death but complications often arise, such as pneumonia, and it then becomes, according to the speaker, questionable whether or not the death should be classed as a fatal mine accident. Again, Mr. Barr would not call any injury serious which is not likely to produce permanent disability. Smaller accidents, such as the mashing of finger with a hammer, should not be reported.

The Kentucky Ambulance Chaser

W. L. Moss stated that he reported no accidents where the injured were able to return to work within a week. Other speakers were Alexander Frost of the North Jellico Coal Co., Wilton, Ky., and W. B. McCord Johnston, general manager Belljellico Coal Co., Belljellico, Ky. The latter stated that he had made a complete settlement with a man whose leg was broken, for $250, and the satisfying of certain store and tenement bills totaling in all $300. The court decided that the figure was too small and gave the matter to the jury, which awarded $6500.

Johnston's blacksmith recently ran after a mule which had run away. He received a scalp wound and the doctor put two stitches in his head. Within an hour an ambulance chaser was on the ground who offered him $425 cash for his case, the attorney agreeing to meet all the costs of the suit and stipulating that he should receive all the damages collected. Mr. Johnston declared that some men did not wait on an accident, but brought suit to recover for impaired health due to bad air. In fact, Mr. Johnston declared that all accidents were "fatal" in Kentucky, a few to the mine worker but all to the coal operator.

Operators Demand That Mine Workers Abide by Contracts

Because the "Mine Workers" in central Pennsylvania have repeatedly violated their labor contracts, such conduct resulting in more than 100 strikes since the present scale agreement went into effect, the operators have issued the following letter to the "Union" officials, giving the latter ten days to comply:

THE ASSOCIATION OF BITUMINOUS-COAL OPERATORS
OF CENTRAL PENNSYLVANIA
301 BETZ BUILDING
Philadelphia, Dec. 12, 1913.

Mr. Patrick Gilday, President,
Dist. No. 2 United Mine Workers of America,
Morrisdale Mines, Penn.

Dear Sir:

The Executive Board of the Association of Bituminous Coal Operators of Central Pennsylvania held a meeting here today, approved and directed that the following communication be forwarded to you at once:

Whereas the Association of Bituminous Coal Operators of Central Pennsylvania, hereinafter called the Operators, entered into an agreement bearing date April 20, 1912, with the United Mine Workers of America of District No. 2, hereinafter called the Mine Workers, for the purpose of governing their relations as to wages, general rules and regulations for the period of two years, expiring March 31, 1914, and

Whereas this agreement was consummated and entered into by the Operators on the expressed assurance that this contract would be faithfully kept and performed by the Mine Workers, and that the officials of your organization guaranteed the full performance of this contract on the part of the Mine Workers, and

Whereas, Rules 12 and 13 of said agreement provide, "Should differences arise between the Operators and Mine Workers as to the meaning of the provisions of this agreement, or about matters not specifically mentioned in the agreement, there shall be no suspension of work on account of such differences, but an earnest effort be made to settle such differences immediately: First, through the management of the mine and the Mine Committee; Second, the first method failing, the matter shall be referred to the Operators' Commissioner and the Mine Workers' Commissioner" and in the event of a failure of such commissioners to reach an agreement, then to be referred to a permanent Board of Arbitration whose decision shall be final, nevertheless the year 1913 has resulted in an absolute disregard of these covenants on the part of the Mine Workers, and

Whereas, notwithstanding the fact that Rule Number 15 provides, "the right to hire and discharge, the management of the mine, and the direction of the working forces are vested exclusively in the operator, and the United Mine Workers of America shall not abridge that right," the Mine Workers have absolutely disregarded this rule in that they have at numerous times served notices on substantially every operator belonging to our Association, that unless all of the employees working for such operator should become members of the Union on or before certain dates mentioned in said notices that they, the Mine Workers, would close or shut down the Operators' respective mines, and in many instances did close the mines for this reason, and refused to return to work unless such non-union employees were discharged. This conduct is in direct violation of your contract and specifically interferes with and abridges the right of the Operator to hire and discharge, of the management of the mine and of the direction of the working forces; this conduct and violation of contract on part of the Mine Workers, as well as that mentioned in the preceding paragraph, has resulted in more than 100 strikes during the life of our Scale Agreement, and

Whereas, notwithstanding the fact that the Operators appealed to you as President of the United Mine Workers of America of District Number 2, to enforce and carry out your contract, and your repeated admissions that the Mine Workers were not living up to their contract, but that you individually were doing all in your power to compel performance thereof, nevertheless it has been open and notorious that your sub-officials, organizers and like employees have been continuing this line of conduct down to the present date, and

Whereas, notwithstanding the fact that the Operators have appealed to John P. White, National President of the Mine Workers of America, for the performance of this contract on part of the Mine Workers, and that he has replied that full authority has been given to you to deal with the situation, still such conduct continues down to date, and

Whereas, these violations of contract have become so notoriously defiant and continued that the membership of this Association have frequently and determinedly notified its Executive Board, that unless this conduct ceased at once, they would withdraw from this Association on the ground that it was useless to contract with a body that absolutely refused to carry out their contract and with no person sufficiently in control of the Mine Workers to enforce the performance of the same, BE IT THEREFORE RESOLVED:

That the Operators enter a vigorous protest against the line of conduct hereinbefore mentioned, and demand of Patrick Gilday, President, and the Executive Board of the Mine Workers of this District, an immediate cessation of the conduct hereinbefore recited, and that they strictly enforce on the part of the Mine Workers their covenants contained in said contract, and in event of the failure to cease such conduct within the next ten days, that the President and Secretary of the Operators' Association shall call a special meeting of the members thereof for the purpose of considering the final dissolution of its Association on the specific ground that it is useless to enter into contract obligations with a body that steadfastly refuses to fulfill the same and which no official apparently has power to enforce.

Yours truly.
W. R. ROBERTS.
Secretary.

The Pittsburgh-Buffalo and Allied Companies

Under date of Dec. 10 the *Boston News Bureau* makes the following comments on the insolvency of the Pittsburgh-Buffalo Co.:

Suit for appointment of receivers for the Washington Investment Co., of Pittsburgh, was begun in the Federal court at that city yesterday by the Cleveland & Pittsburgh Coal Co. The complainant asserts that the Investment Co. is solvent but temporarily embarrassed. Earlier in the day James K. Cassiday had been appointed receiver for the Coal Co. by the Federal Court at Cleveland on complaint of the Pittsburgh-Buffalo Co., of Pittsburgh which went into receivership Saturday. Later James Bryan was appointed receiver by the Pittsburgh Court of Common Pleas for John H. Jones, president of the Pittsburgh-Buffalo Co. The application was made by the Goodman Manufacturing Co., of Chicago, a creditor. Immediately afterward the Sharon, Penn., Saving & Trust Co. began suit against Mr. Jones for $10,000 on a promissory note secured by Pittsburgh-Buffalo Co. stock.

The actions yesterday followed the appointing of receivers for the Pittsburgh-Buffalo Coal Co., a $6,000,000 corporation, and the Johnetta Coal Co., Saturday in Pittsburgh by United States Circuit Court Judge Joseph Buffington and for the Four States Coal & Coke Co., a $6,500,000 corporation, by Judge A. G. Dayton, of the United States District Court at Philippi, W. Va.

Strikes, explosions, floods and other incidents to coal mining are given as the causes of the temporary embarrassment of the coal properties.

Anecdotes of the Mountain Folk

By Neil Robinson*

SYNOPSIS—Amusing stories concerning the mountaineers of West Virginia and Kentucky who have been aroused from their primal mode of life by the encroachments of the mineral man prospecting for coal.

⁂

The West Virginia Coal Mining Institute begins its sessions this morning in a very serious mood. Our estimable secretary, E. N. Zern, has arranged to lead you through a maze of profound discussions relating to chemistry, salesmanship, the influence of public sentiment, scientific mining and the enforcement of the prohibition law: we will travel to Panama with former Governor MacCorkle; Hon. Lee Ott will tell us the story of the humane compensation law; and Governor Hatfield, for many years a distinguished medical practitioner, will speak on sanitation and the protection of health in mine villages.

A few years ago, institutes were unknown in our state. Our gatherings were limited to political conventions, meetings of various grand lodges and occasional camp-meetings. The individual manager and operator never visited the plant of his neighbor. It would have been regarded as impolite—possibly as spying. There was very little traveling to the so called backwoods or "up the creek." The operator journeyed from the mine to the banking town for a payroll and sometimes visited the general office of a railroad to sell some fuel. The motive power at a mine was a mule; the best mining machine was Irish and for ventilation we sometimes lighted a fire at the bottom of a mud-daubed frame stack proudly called a furnace.

It would be interesting to trace the development of the mining industry from these crude beginnings and make a contrast with the goal which the eminent men in our profession are now seeking to attain, but I prefer to carry you away for a few minutes from the symbols of chemistry, the wonders of electricity and the constructional work of man for a little journey to the lands beyond "the head of the creek."

A Trip to the Mountains

I count it as a bit of rare good fortune that professional duties called me into the mountains while the men and women there were still natural, the spinning wheel in use, handmade rifles in service, good old sorghum served in coffee, and celluloid collars and patent-leather shoes unknown. There was always a cordial welcome for the stranger and many a time the head of the house has called from the door of a cabin "get off your horse and come in and warm up—you know pore folks have pore ways but we're glad to see you."

Once I entered a field that had evidently been visited by several coal seekers, for the following loudly shouted conversation took place. (The man who owned the coal opening I was endeavoring to locate was plowing far down on a hillside below the ridge road:)

"Hello! Are you Mr. Frank?"

"Yes; and who mout you be?"

"I am Mr. Robinson from over at Charleston in Kanawha County."

Mr. Frank made a megaphone of his hands and literally yelled back:

"Air you one of them dern mineral men what goes through the country a lookin' at coal seams and a leavin' down fences?"

Of course, it was useless to deny my guilt and we finally compromised by his election as boss of the rail-fence gang with the right to discharge himself if the work was not well done. No one was discharged.

Traded His Wife for a Rifle and Dog

Two days later I came to the clearing of an old settler who had been there "ever sence it was a case of one blaze from home and two blazes fer home." The cabin was without a window and as we sat by the log fire, our light from the open door was cut off by a tremendously large woman, barefooted and smoking a pipe, who stood on the step watching some kittens at play. My local guide looked up in some surprise and said: "Why, Mr. Lotts, I did not realize that your wife was so big—I thought she was a thin woman." The old man put his hand to the side of his mouth and said: "Smith, I reckon you're thinkin' of the t'other one. That 'un was a powerful worker, but she was thin es a fence rail, but you know I traded her 'n a rifle for this 'un an' a coon dog—an' 'fore God, Smith, I jes wish you could see that coon dog."

Many times in my travels I have met men who under more favorable circumstances might have graced the highest courts in our land or have become masters in the world of commerce and finance. These really great men in many instances were lost to the great world through a fine sense of duty to dependent women and children in their little world. As the poet has said: "Full many a flower is born to blush unseen and waste its sweetness on the desert air"—and many acts of devotion in the depths of the mountains are unknown to mankind. Let us hope that they are recorded in the Great Book of Life.

The typical mountaineer of the older school is nearly always logical in his processes of reasoning. He reaches his conclusions without mental finessing and has a why for every wherefore. I recall passing a camp-meeting ground in the early morning and afterward passing scores of men and women hurrying to the services. It seemed to me that every house on the mountain would be deserted and that all thought of dinner might have to be abandoned, but a little before noon we heard an old-fashioned flail resounding from a barn and knew the owner would soon eat and perhaps we might be able to join him.

While the meal was progressing, I asked my host how it happened that he was not at church. "Well," he said, "I ain't there fer two mighty good reasons. In the first place I been usin' my stock purty consid'ble this season and I ain't had no time fer to corn cob 'em down and get 'em fittin' fu' swappin'; and in the next place I was born and raised in this here county and I know there ain't enough religion among the perfessin' Christians fer to

---

Note—President's address, West Virginia Coal Mining Institute, Charleston, W. Va., Dec. 8, 1913.

*Coal expert, Charleston, W. Va.

save one soul and I don't perpose to go down to that air meetin' and git my chances of heaven mixed up with them dog-gone perfessin' Christians."

Burned Wood Even though a Coal Seam Outcropped in His Back Yard

There was a fine seam of coal six feet in thickness showing in the outcrop by the barn but wood only was burned in the house. This fact, however, was easily explained: "Bein' a man of sense and jedgement as I 'low ye are, ye can see for yourself that that coal is too dern fur fer me to go pack it and it ain't fur enough to hook up a team and go haul it—so we jes burn wood." In justice to his wife it is only fair to remark that she handled an ax with great skill.

Down on the Cumberland Plateau, in Tennessee, I stopped at a cabin that was overflowing with children and when we all sat down to supper the table was lined on both sides from wall to wall. Of course, a reference was made to the fine large family and the pride the parents must have in this possession, when the old man by way of reply explained everything: "Yes, sir, it's a big family, but it ain't a matter of choice—it's a matter of need-cessity. Us folks on the mountain hev to hev big fambleys in order fer to git a fair sprinklin' of boys. Ef you have a passel of boys around the house some of 'em will do a leetle kase they're fond of their maw, some kase they're feard of their paw—and some kase they ain't got no better sense—and 'tween them boys doin' a leetle and me and the old woman here doin' a h— of a site we manages to live."

There is a charm about the mountains that is not equaled by the prairies with their monotonous levels; and I have had days at sea when the entire ocean would have been gladly traded for a single knob in the Alleghenies. There is a wonderful charm in our clear, cold streams; in the hills when tipped with clouds; the drumming of a pheasant; the play of the squirrels; the flight of birds—all these please the eye.

But there is another pleasure in store for the lover of the woods. Imagine a long day drawing to its close, twilight deepening into dark. You are traveling a strange trail in a strange land, when the tinkling of a cow bell or the barking of a dog is heard in the distance and presently the sweet aroma of the "frying pan and bacon" floats down the valley. That is a blissful moment. You are nearing a home for the night and a long hour's talk before a big log fire with all the family present and perhaps a few of the neighbors who have stopped on their way from a grist mill.

One night like this in the Pine or Cumberland Mountains of Kentucky I tried to harvest a little information for use on the following day, but every inquiry addressed to the head of the cabin brought a stereotyped reply, "I don't know nuthin' about them things, but I allow as I know as much about matermunny"—meaning matrimony—"as any man on the crick." My host was so full of this subject that after supper I naturally asked for particulars and this was the tale that he told.

An Authority on Matrimony

"I've been married three times—and still a livin'—and that's mor'n most of my neighbors can say—and eight of my children are livin'—and most of 'em here now."

They were all there, commencing with two grown girls and ending with a baby a year old.

"The very fust time I married I got a woman with lots of sperrit. She had the reddest head this side the mountain and one of her eyes was a leetle crossed and she had more temper than me—and I got some. We fit frequent. We surely did—and finally I got to norating round that I was the only man on Kaintuck waters what could live with her. In them days a feller what had lost his last wife lived in that old clearin' next mine and he 'lowed he could live with her at least six months and was willin' to bet a crackin' good young steer against a colt I was raisin' that he could. Me and my wife that then was, talked it over and she was agreeable to goin' pervidin' we could git a de-vorce—and we done it easy, kase the squire what married us wuzn't one of the book-keeping kind and we jes tore up the old stificate in the presence of the two Ramsey brothers who was some of her kin.

"She hitched up with the other feller and I made a run of moonshine and took things sort o' ca'm and easy like fer a spell. Onst in a while I'd go down to the line fence and look over to see how the steer I was going' to get was comin' on, and then I got to meetin' the other feller who was still a stickin' and had took to watchin' my colt. I seen he was gettin' powerful interested, as the six months was nigh up, and it made no diffunce how many cockleburrs that colt wore it looked good to him, and I was gittin' mighty much worrited.

"He sure was game. The day before the time was up I knowed that somethin' had to be did—and did quick—and I raked up all the green apples and green corn and collicky stuff I ever heerd of and commenced stuffin' that colt—and it took—and afore midnight I went after the feller to come and help do some doctorin'. He swore a site and said it would die afore mornin' and he was goin' home—and he went that way—but he never stopped and he never come back—and I druv the steer over into my lot before 'red-top' turned out to git her breakfast!"

The talk was general for a little while, the men said they remembered the affair, and "red-top's" two girls remained quiet, apparently taking the adjustment of affairs as perfectly natural. Without any urging the old man took the floor again.

"Lots of things is wuss and yit sometimes maybe you find 'em wusser—and too much sperrit in a woman ain't so bad when you got one what ain't got any—like my second wife. She was com'fble fat when I got her and kep gittin' fatter and fatter and I 'lowed I'd hev to git the guv'mt to help feed her, when she up and died rising three hunder pounds in weight. We had to knock down a lean-to off'n the barn to make a box, and it took that other feller's steer and one of my own to sled her up on the p'int whar she still is—but I bet she ain't no lazier dead than she was afore it happened."

"I ain't goin' to say nothin' 'bout this little woman here now, kase she's young and spry and I'm getting stiff in the jints and mout have a leetle trouble in gittin' another if she'd run off."

There was neither a lamp nor a candle in the house and the children lighted slivers of pitch pine for illumination. Some of the rich pitch spluttered into the corn bread and gave the latter a flavor that was never known in modern cooking schools—but perhaps it was introduced to prevent the "last chance" wife from following in the

Jumbo-like footsteps of number two. Our eminent conservationist, Doctor White, would have commended my economy in food consumption—at that time.

Religion of the Mountaineers

Upon innumerable occasions I have been asked about the religion of the people in the mountains, but the question is hard to answer. Earnest men and women are found in every community. The services of preachers are well attended and the only songs one will hear on a long journey are those taken from hymnals. Great consideration is always given to a minister of prominence and the housekeepers, if notified of the coming of a presiding elder or bishop, will spend days in preparing food.

Some five or six years ago I was planning a trip through eastern Kentucky when the itinerary of a presiding elder was made known to me by the enthusiastic brother who had perfected the arrangements. I at once showed appreciation of the skill of this brother by destroying my own plan and accepting the one made for the elder, but to avoid a conflict in dates and overcrowding in small houses, I made the complete circuit two days in advance. That was the time I gained in weight at the rate of 16 oz. a day. The elder lost about 20 lb. on his trip, which is hard to account for as I found the living conditions unusually good.

But I must sand the track, sprag the cars and stop the train. It would please me to tell you about the amateur geologist over in Buchanan County, Va., who accounted for an immense mass of broken stone on a slope of the mountain by declaring that he had "studied about it a site and finally 'lowed that when the Lord was in these here parts sowin' rocks he must have drapped his apron string in a-comin' over the pint."

The neighborliness of the people could be exemplified by the attitude of a good old friend in a Southern county. He was divorced and at once married again, and the divorced wife immediately married and went to live on the adjoining place. When my host was asked how he got along with his ex-wife, he said: "Fine, mighty fine. We are the very best of neighbors. Why, there ain't a family on the mounting we borrow as much from as we do from them folks."

At the risk of being called a bad neighbor, I will cease borrowing from your time and will now turn the institute into its accustomed channels, at the same time hoping that your stay in Charleston may be pleasant, that old-time friendships may be renewed and that your deliberations may result in great good for the thousands of men whose welfare and safety rest so largely in your hands.

⁂ ⁂

Purchasing Coal under Specifications

By Reginald Trautschold*

SYNOPSIS—Some notes on the impracticability and inconsistencies of this method of coal buying. Behavior of the coal in the particular furnace in use is a more important consideration than its theoretical heat value. Complications in methods of sampling and the impossibility of devising an adequate specification are among the troublesome features of the method.

⁂

Among the claims made by the advocates of purchasing coal under specifications is that, being paid for on a quality basis, the coal dealer is incited to prepare the coal more carefully. This result, though not the only or greatest advantage claimed, undoubtedly is the object desired and is also the result upon which the feasibility and practicability of the policy must depend. To the average dealer, however, increase in his trade is sufficient incentive to keep him supplying the best grade of coal, and the larger the buyer the greater the incentive to give individual satisfaction. Therefore, the claim that the dealer would be incited to more careful preparation of his product seems hardly convincing.

Some Inconsistencies in Coal Specifications

Carrying inspection of a commodity to the extent of ascertaining its chemical characteristics, while perhaps of exceeding interest, would often, in the case of commodities purchased continually and in large quantities, prove neither practical nor feasible. In the case of coal, the impracticability, for the average consumer—he who buys in lots of not over three or four carloads at any one time—would seem obvious. Such consumer would have no conveniences for analyzing and would have to spend from two and a half to ten per cent. of the cost of the coal in having the necessary tests made at a laboratory—almost as much as any reduction he could expect in price should the coal be found to be considerably below specifications. Furthermore, as occasional consignments may be reasonably expected to show better results than the specified requirements, instances would crop up when the expense of the analysis would prove not only a dead loss, but the coal would be unnecessarily increased in price thereby.

It must be considered also that the cost of mining coal at any mine is not in any way regulated by the heating value of that coal and, therefore, a valuation based on heating value and chemical characteristics would place an unfair profit on certain grades of coal and entail a loss on others. As a result only the more profitable grades would be dealt in and the others, many of which possess high heating value and other desirable characteristics, though possibly failing to meet certain chemical requirements, would only reach the consuming public when other coal could not be procured.

For instance, the prices of anthracite coal at the mines, which may be considered as indicating the relative cost of mining and preparing the various sizes, shows chestnut to be much the most expensive as far as heating value is concerned. Anthracite of larger size decreases in cost, per heating value, fairly uniformly, broken costing but about 80 per cent. as much as chestnut. In the sizes below chestnut, the decrease in cost per heating value is much more marked and shows greater variations, pea costing about 62.2 per cent., buckwheat No. 1 about 38.1 per cent., buckwheat No. 2 about 19 per cent., barley about 14.1 per cent. and culm about 13.8 per cent. as much as chestnut for the same heating value. Different grades of bituminous coals show somewhat similar variations, not to quite such a marked extent, it is true, for a large proportion of this class of coal is sold as mine-run and is crushed at the consumer's plant, thereby placing a more uniform price on the heating value of the coal.

---

*Consulting and contracting engineer, 160 Waverly Place, New York.

Practical Considerations in Coal Purchasing

The behavior of different coals in the furnace has considerable weight upon their power-producing capacity and this cannot be ascertained by chemical analysis, thereby detracting considerably from arguments in favor of purchasing coal under specifications. One coal of relatively higher ash contents and lower heating value than another may prove to be the much more satisfactory and economical on account of its ash not clinkering while the better coal, as far as heating value is concerned, might clinker to such an extent as to make its use uneconomical; or, at a high rate of combustion, ash may clinker in a given coal, while at lower rate it may not. Under the ordinary specification system, the customer could not refuse the clinkering coal but would have to pay a higher price for it than for a poorer (?) grade that might have proved more economical and satisfactory for his particular use.

The relative percentages of fixed carbon and volatile matter have differing results on the heating value of coal and though the B.t.u. test may show this, it cannot ascertain the actual results in the ordinary furnace. Volatile matter may be combustible or noncombustible; a coal with a lower fixed carbon content and greater volatile matter constituent may have a higher heating value than one in which the fixed carbon is proportionally greater and the volatile matter less or *vice versa*. This the B.t.u. test will bring out, but the behavior of the coal under actual operating conditions is another matter. Volatile matter may prove an advantage or a disadvantage irrespective (without apparent definite effect) to its proportion of combustible qualities or the heating value of the coal.

Moisture in coal is customarily limited under the specification system, the dealer guaranteeing a maximum moisture content which if exceeded, calls for a reduction in the price of the coal. The presence of moisture in coal is largely accidental and can no more be guaranteed or controlled by either the dealer or the miner than can the weather, so why complicate conditions which cannot be provided for? The allowable percentage of sulphur is also usually specified, a reduction in price being called for if the sulphur content exceeds the percentage called for. The proportional part of sulphur in combination with other metals and minerals in the ash is what usually causes trouble, a relatively large proportion of free sulphur or easily reduced compounds of sulphur not having the same detrimental effect as certain other combinations containing less sulphur.

Some Complications in Specification Buying Methods

The yearly spring reduction in the price of coal at the mines, a practice that has done much to regulate and steady the coal trade of the country, would also be complicated by any universal adoption of the specification method of buying. A reduction in cost per heating value of coal, similar to the present reductions in the cost of coal per ton, would be conducive to numerous complications. It would also tend to increase the congestion of expensively mined coal, much of which would have high heating value, and the shipment of the coal upon which the greatest profit per heating value would be realized.

The advantages claimed for "purchasing coal under specifications," though theoretically justified in great part, could only be fully realized by the adoption of complicated and detailed specifications; and even then it could be severely criticized, while there are unanswerable arguments to be advanced against such a method—business reasons, that bear considerable practical weight. For instance, irrespective of the merits of the case, the average coal dealer can well afford to contract with a large consumer to supply coal over a long period at a considerably lower price than if each consignment requires a distinct bargain or contract. In fact, should he be able to contract with a few important customers to take a sufficient amount of coal during the year, he could afford to sign up at a price that would simply cover his expenses, depending upon trade from other customers and smaller business for his profit. To arrive at his minimum price, he would figure on the known cost of his supply and the approximately known expenses to which he would be subject. That is, he would figure in known quantities and so closely as to prohibit the taking of speculations as to the value of his stock, invariably having obtained his contract as a result of previous satisfactory service and the incentive of continuing such service as far as he is able in order to secure future business.

Under the specification method, not only would his expenses be increased by the frequent tests necessary to check the claims of his customers, but the speculative risk of a certain consignment of coal from the mines falling below specifications would have to be taken. To avoid the possibility of this latter, he would have to base his price on a coal of less heating value than the average fuel to be supplied to his customer, and the latter is called upon to pay such a price for coal as would protect the dealer against loss and cover the expense of the analysis by the dealer and himself.

The relatively small customer would be under a serious disadvantage in purchasing under specifications for he could ill afford the expense of frequent tests; neither would he have the necessary influence with the dealer to insist upon his rights and would, in many instances, be forced to take coal that had proved unsatisfactory to the more important of the dealer's customers.

The rejection of coal or the reduction in its market value, on account of its failure to live up to certain chemical specifications or meet a laboratory-heating test, may be justified in some cases, but in others it does not necessarily follow that such failure means unsatisfactory coal under working conditions. Visual inspection can be just as reliable at times and no sample testing can be taken as conclusive evidence that the mass of coal is similar in all respects.

Certain effects of the adoption of the specification system, disadvantages that are just as important as the advantages may then be summarized as follows:

Summary of Disadvantages

1. Impossibility of a purchaser contracting for his

entire coal supply for an extended period at as advantageous a price as under the "tonnage system," owing to the dealer having to assume the speculative risk that the coal will not fall below specifications.

2. The failure of chemical analysis and laboratory-heating tests to ascertain the behavior of coal under the purchaser's operating conditions, the "specification system," however, compelling the purchaser to accept any coal that met the specifications, irrespective of its behavior in the furnace.

3. The injustice to the small consumer who cannot afford to assume the expense of careful tests, increasing the liability of his having to accept coal that had proved unsatisfactory to some other, and larger customer of the dealer.

4. The increased difficulty in the disposing of coals that entailed heavy expenses in mining and the unfair impetus given to business in the coals that have been mined at least expense, tending toward general elevation in the price of all coal.

5. The tendency to cause congestion of unsalable coal at the mines, even that which may have excellent heating value but fail to meet certain of the requirements of the ordinary specifications.

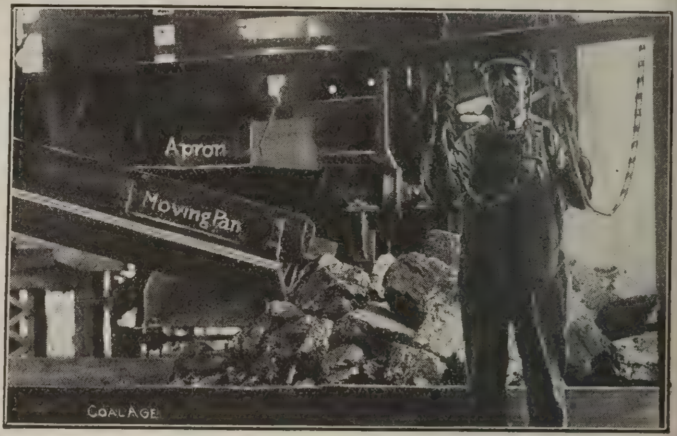
6. The danger of disputes as to the accuracy of various tests and the ill-feeling between dealer and customer that continual claims and disagreements would bring about.

7. Annoyance, expense and loss of time brought about by disputes and in the replacement of unsatisfactory coal by other coal that may or may not prove satisfactory.

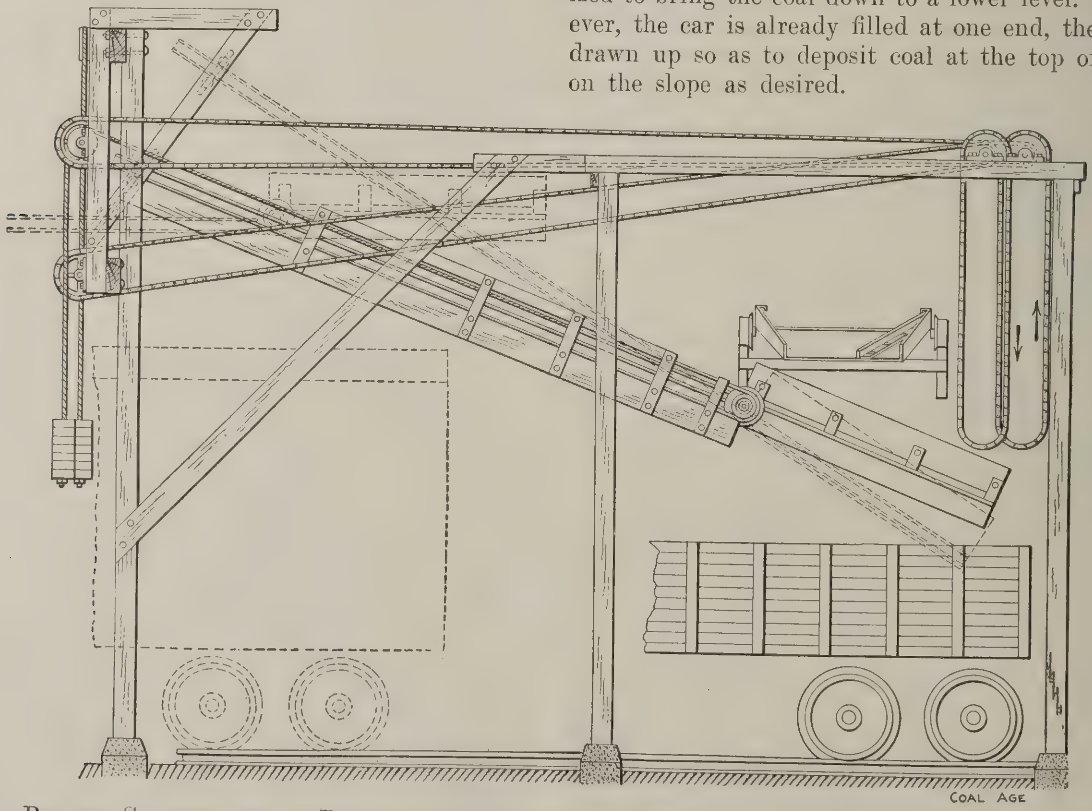
8. The added expense to the small consumer by the adoption of the "specification system" and the probable difficulty of his ability to enforce his claims.

A Loading Boom

In the southern Illinois field a number of operations are putting in the loading boom, manufactured by C. C. Hatfield, of Duquoin, Ill. At right angles to the main pan, which discharges diametrically across the track is placed another pan which lies parallel with the rails and which can be pulled backward and up or forward and down. Thus the coal can be placed in the car with the minimum of breakage. When the car is empty it can be loaded with the pan slidden forward to its extreme distance. Thus a long length of the sliding pan will be utilized to bring the coal down to a lower level. When, however, the car is already filled at one end, the pan can be drawn up so as to deposit coal at the top of the pile or on the slope as desired.



An Illinois Loading Boom



By the Sliding of the Boom, the Coal Can Be Deposited with Minimum Breakage

The wide range of motion and the possibility of tilting it at will is shown in the drawing. It can be used for cars of varying elevation with equal facility. The drawing shows a wooden tipple but the device has been applied to more modern and permanent construction.

Discussion of Election of Mine Inspectors

SYNOPSIS—The origin of the elective system of choosing mine inspectors in the anthracite region of Pennsylvania. Reasons why the law should be abolished. Controlling power of the miners' organization under the election law. Commission appointed to revise the anthracite mine law. The elective system in Illinois discussed. Suggested appointment of inspector by the courts and for a term of good behavior. The Institute strongly opposed to the elective system. Resolution adopted.

⁂

D. J. Roderick (*Pennsylvania*)—Mr. President and members of the Institute: I was asked this morning to lead the discussion of this question of the "Election of Mine Inspectors," because, unfortunately, I am one of those who come under the elective feature. The inspectors of the anthracite region of Pennsylvania all come under the elective system, while those of the bituminous region come under the appointive system.

In 1901, a certain element in our state conceived the idea that if they could get control of the mine inspectors of the state it would make their forces stronger. The legislature being in session at the time, they sent a large delegation to Harrisburg and secured the passage of a law making the office of mine inspector in the anthracite region of the state elective, reducing the term of office from five to three years. Previous to that time, the anthracite inspectors were appointed by the governor, after examination, but since the passage of this law, they are elected by the voters of a certain prescribed district. We must first take an examination, then register with the County Commission, and be placed on the ticket to run for the office of mine inspector.

Elective System Should Be Abolished

The elimination of this law is one of the questions that should receive the consideration of this institute. The matter was thoroughly discussed in Chicago (1910), and I think, at that time, we had one champion of the elective feature; he was also in favor of the referendum and recall. This man was later elected to the office of mine inspector; he served about three months and was recalled; so he had a dose of his own medicine. The elective feature connected with the office of mine inspector is a sample of vicious legislation. Suppose, for example, that after you have been studying for the examination, you succeed in passing the same, six months prior to the election. During that six months you must cover the whole district in a personal campaign. It would not be so bad if the elective feature was confined to the district in which the inspector belongs. For instance, I come from Luzerne County, which has six inspectors, and I must cover that whole county for reëlection. In my district about half of the territory is agricultural and the other half mining. I must see the voters, go down into common places, meet them in the saloons, hobnob with them, and try to curry favor and get their votes for the office of mine inspector. People in the agricultural section don't care who is inspector; and the man who gets the office is the man who can spend the most money and be the best fellow while running for office.

Another feature of the situation is the time lost by an inspector, in a campaign, which starts three months prior to election. There are three months lost in soliciting votes that should be devoted to the inspection of mines. This acts greatly to the detriment of the conditions that prevail in the mines. Moreover, it is very unfortunate for a man in the position of mine inspector to have to humble himself to Tom, Dick and Harry, in the saloons, and to the neglect of his work. Again, to canvass the agricultural district is not an economical situation. A man must hire a team, or an automobile, travel around the country, and meet farmers here and there, who know no more about mining than a child who never saw a mine. They have no interest in them.

The effect that the elective feature has upon the efficiency of the mine inspectors is detrimental also from the operators' standpoint. A mine inspector goes to a mine and finding things as they should not be, calls the attention of the operator to them and asks to have them remedied. It may mean a large amount of expenditure of money. You tell him it must be done regardless of the amount of money involved. That operator complies with your request; but, in his heart, he says, I will get square with you, two or three years hence, and he does. He puts money into the campaign to have the mine inspector defeated. The matter is equally as bad from the miners' standpoint. Miners, organized as they are, often make a great deal of trouble for the inspector.

Influence of the Miners' Organization

In the anthracite district, in the last agreement made between the operators and the miners, the miners put one over on them. They succeeded in the settlement of that strike, and it was agreed that the operators allow them what is known as a grievance committee, at every mine. This committee consists of three members working at each place; and they have the privilege of going with one of their officials to the office of the colliery and bringing the matter before the mine officials. The mine inspector in going around through the mines, sometimes meets this grievance committee, and this often interferes with the inspector's business. For instance, they will tell him that the air is bad in a certain section of the mine, or that it is not what it should be; that the company is not furnishing supplies to the man in certain sections of the mine, as the law requires. In fact, the methods employed by the United Mine Workers is often hard on the mine inspector, to a certain extent, bringing things to his attention some time after the matter has been remedied, and using him as a lever to adjust their grievances with the operator. Always where there is the least chance to bring in the mine inspector, he must act as umpire between the operator and the miner; in fact, on many questions in regard to which he should not interfere.

If a mine inspector gets a request from an official of the United Mine Workers, and does not act, it is heralded throughout the district; and the matter is taken up by the locals, which pass resolutions denouncing your refusing to act. If you go through the mine and see a miner violating the law by using two kinds of explosives, or find him ramming dynamite in a hole when at any moment it may explode, and you take him to task, it is

---

Note—From the published Proceedings of the sixth annual meeting of the Mine Inspectors' Institute, U. S. A., held at Birmingham, Ala., June 10-13, 1913.

reported to the local; and they use the threat, "We will fix his feet."

The inspector when he is elected is used as a tool to adjust matters where it is absolutely none of his business. He is at the mercy of both miners and operators. Operators are in a position to put money into the campaign to defeat him. I read an excellent article in COAL AGE recently on the evils in connection with the election of mine inspectors, and I hope that COAL AGE will continue to fight this law. I think I have covered the matter pretty well; but this currying favor with everybody in order to retain a position of responsibility is wrong. I hope the time will soon come when that part of the law will be eliminated from the statute books never to appear again. It is a step backward toward the dark ages. To bring the elective feature into the office of mine inspector, detracts from the dignity of the position.

You all know that as a rule the mine inspector is selected, not because of any political influence connected with the position, but because of some qualification that he possesses equal to or perhaps better than that of another man. It has been the case formerly, in Pennsylvania, that when a company wanted a man as a foreman they selected the best in the company; and when the state wanted a mine inspector, the very best man among the foremen or superintendents was selected; but today the shrewdest politician is the only person who can get the office; and to hold it for any length of time he must humble himself to some people whom otherwise he would consider beneath his notice.

REVISION OF ANTHRACITE MINE LAW

MR. DUNLOP (*Illinois*)—What has the present session of the legislature of Pennsylvania done with regard to eliminating the elective feature?

MR. RODERICK—I will say that the chief of the department of mines, at the session prior to the present one, had a Commission appointed to revise the mining laws of the anthracite region. This Commission consisted of nine people, and the chief of the department of mines was elected chairman. The Commission has now been working diligently, for 18 months; upon a new code of laws to cover the anthracite region of Pennsylvania. From that new code they hoped to eliminate the elective feature of the mine inspector. They also incorporated several good features to govern the mining of anthracite coal in the future. During the last decade, or twenty years, many great changes have taken place in the anthracite region. There has been installed much new electrical machinery, air compressors, electric motors, etc., etc. The Department of Mines went into that matter very thoroughly; they employed electrical engineers to give them an outline of what should be done to improve the conditions in the mines with respect to the installation of electrical machinery. Several other good features were inserted into that proposed law and the question of examinations as conducted under the present system, was amended, besides abolishing the elective feature from the laws.

Organized locals and officials of the Union went, in a body, to the House Committee in the legislature and demanded the enactment or the presentation of a code known as the minority code. The United Mine Workers combined to abolish the feature of the miners' examinations. We did not want it abolished, but amended so as to remove the danger of issuing certificates to incompetent people. There is always some hook or crook to get around the present law. There are three boards of examiners in Luzerne County, one in my district and two in the other districts of the county. The Commission wanted to insert a clause in the law providing that if a man came from the mining countries of Europe he might be given a year's advantage over another who comes from a country where there was no mining at all. In other words, men from England, Wales, Ireland or Scotland would only be required to work in the mines one year before being able to get a certificate to mine coal in Pennsylvania. But those coming from where they never mined coal, would have to stay in the mines two years, as they do now.

CERTIFICATION OF MINERS

One thing in connection with the present law the United Mine Workers did not want touched. The Commission was willing to draft a law and have it submitted to an attorney selected by the miners, with a view to making the Boards earn their salaries by the issuing of these certificates. Some may not understand the present method. The law says the members of the examining boards shall receive $3 per day for their services; but no part of their salary shall be taken from the state treasury. Now, if only nine people apply for certificates, you can rest assured the examining board will not turn one of them down.

The Commission wanted the boards appointed either as they are now, or by the Courts of Luzerne County, or by the governor of the state; and be allowed $5 per day and their expenses, but not to sit more than four days, which would remove any possibility of the Board accepting everyone who applied in order that they might not lose. We have not had the coöperation of the mine workers in carrying out this law. When the law hurts the operator, they are satisfied for us to investigate it; but if we take a miner to task for a violation of the law, they report the fact to the Union. Instead of upholding the mine inspector they say "Let, him go to the hot place." That is the condition under the elective system. I trust that that feature will be eliminated in whatever state it may exist.

MR. DUNLOP—What is the present condition of the two codes?

MR RODERICK—The position in which the two codes are, at the present time, is this: the minority code has passed the House with but one dissenting vote. The majority code lies in a pigeon hole at Harrisburg; but it is not likely that further action will be taken on either code this session.

MR. FLYNN (*Alabama*)—If a man fails to pass the examination, is the $1 fee returned to him?

MR. RODERICK—He does not pay the dollar until the certificate is given to him. The examination consists of 12 questions, asked in the English language. If he answers these questions successfully he pays his dollar and gets his certificate. It is not a hard matter to get a certificate; the law is very lax, and the Board is not expected to know everybody that comes before it. The territory in which my Board operates is about 25 miles long by 12 miles wide. Every applicant must have a man to vouch for him, although the Board may not know the applicant or the man who vouches for him. Often a man applies who never expects to use the certificate. Some slick duck or smart aleck who can answer the questions and understands the English language will apply and sell out to his fellow countryman for $5; but when he gives his name to the Board, he is careful to give the name of the friend for whom he wants the certificate. They traffic frequently in that business; they get the certificate for $1 and sell it to their friend for $5. You will see a man working in a mine and will wonder how he got a certificate; and the board will tell you they never issued a certificate to that particular man. There is a great deal of fraud in securing these certificates.

Election vs. Appointment in Illinois

Mr. Back (*Illinois*)—I am glad to hear these remarks of Mr. Roderick's, because we have had the same difficulty in Illinois this winter, except the miners wanted to make the term one year instead of two. We are at present under civil service. In December, a convention of the miners was called and they were to appoint delegates who should pick the men for inspectors. We found that pretty strong, but they laid down on it and we have been under civil service since July. Now, the man who is out stands a better chance to be appointed.

Mr. Bolt (*Illinois*)—During the last winter there was a bill introduced into the House in Illinois, calling for the election of state inspector of coal mines. The provisions were something as Mr. Back has stated, and some of the miners were in favor of the bill. I think many still favor the passage of the bill, but they are losing strength. It is being explained to others that are not quite so enthusiastic over the bill, showing its weakness and defects. I don't believe that a bill of the kind will ever be passed in the state of Illinois. No mine inspector or anyone connected with the mining business, unless it is a miner, would favor such a measure. It would tend to retard efficiency and to make the inspector responsible but to one element in the industry; and if he did not do what the mine workers demanded, he would be defeated. On the other hand, if he was willing to prostitute his manhood and do as they wish, he might be retained, provided he made no mistakes and was not recalled.

In Illinois, we are going to oppose such a bill first, last and always. We want to increase the efficiency of the mine-inspection service rather than do anything that would be a detriment to it; and I believe that Illinois has made as rapid progress in that direction as any state in the Union. At first, we had several members who did not care to enter the civil service and make out the required reports; but they finally concluded that, after all, it was the best thing to make full and complete reports. We have not heard any complaints for a long time along those lines, and we are getting better service in the way of mine inspection in Illinois than ever before. I think each member present will indorse that statement. I am opposed to the plan of electing mine inspectors. I would be opposed to it, even though it was made elective by districts for the reason that an inspector should not be called upon to devote his valuable time to going around soliciting votes. I am opposed to the plan of politics having anything to do with the work of mine inspection. A man who renders good service to the state should be permitted to continue in office provided his service as inspector continues efficient. The kind of inspectors we ought to have is men who take an interest not because of the wages, but because of the work. There is a good deal of honor connected with work where one can render service to his fellow men.

Mr. Dunlop—I will add a few words in as much as Mr. Bolt has mentioned the civil service. It is true that since the state inspectors have been brought under the civil service law, they have been required to give closer attention to business; and those who had been inspectors for 12 or 14 years before that law came into effect did not like reporting each day. But on the whole, the requirements of civil service are good and we will be able to tell you more about it a year hence. This is a year of trial in Illinois; we have had a change of administration and cannot say whether the civil service law is for the best or not. However, it makes the mine inspector work whether he wants to or not. If a man does not attend to his duties, and does not make out his reports, etc., as they should be made out, the civil service commission can say that his services are no longer required.

Mr. Beard (*New York*)—I am glad that Mr. Roderick has referred, in the words he has, to the question of the election of mine inspectors, in the anthracite region of Pennsylvania. I am not an inspector myself, but want to say that this is a very proper question for this body to discuss. Mr. Roderick has given, better than I could attempt to do, the evils that come from the elective system. I lived in Scranton, which is in the anthracite district, for six years previous to the enactment of the law requiring the election of mine inspectors, and for ten years after the law had been passed. The law was passed in 1901. Having been in close touch with the mine inspectors' work, as an outsider, I have watched with interest the working of the law in respect to this system.

Appointment of Inspectors by the Courts

Mr. Roderick has brought very clearly before you the evils that grow out of the elective system. I don't wish to dwell further on those points, because I believe that he has made them clearer than they could be made by anyone in my capacity. But, as one outside of the inspection service, I could afford to refer to a matter, in this connection, that perhaps you gentlemen would not like to mention, and that is how mine inspectors should be appointed, and how long they should serve. A mine inspector is a man who should be as far divorced from any influence that would trammel him in his work, as possible. You know, gentlemen, there are laws that govern all natural conditions, and much the same laws control our physical work. A man who is under any influence that would trammel him in his work is obstructed in that work; just as we can obstruct the flow of air in an airway or through a mine. It is not necessary to argue the question. The main point is how can we secure the appointment of the mine inspector in such a manner as to divest him of any influence that would embarrass him in the performance of his official duties.

After carefully considering these questions, in my own mind, I have come to the conclusion, from an experience of six years as secretary of the examining board for mine inspectors, in Iowa, and from my observation in the anthracite region of Pennsylvania, that the mine inspector should be appointed on some other basis, as far removed from politics as possible. We may say there is no appointive power that would be exempt from undue influence from political sources. The only appointive power that we can go back to with any confidence is the judiciary, as represented by the Courts. Courts are not entirely exempt from intrigue; some of our Courts are corrupt. But I believe, gentlemen, and I think you will agree with me, that the Courts are the only power that is exempt, in a measure, from such undue influence. I would put it this way: They are the power most exempt from ultra influences. If, then, the mine inspector could be appointed on some judiciary basis, through the courts, after undergoing the examination and showing his ability to serve in that office—if that could be done—I believe that it would be a step in the right direction.

I believe, further, that when a mine inspector has once been appointed that his tenure of office should extend through good behavior; I might say through life, with the possibility of recall, by the same appointive power that put him in office. No man is perfect; mine inspectors are not perfect; we have evidence of that; and we should not put a man in office for life, but during good behavior. The point is this: When a mine inspector has spent five, ten, fifteen or twenty years in the service, he knows better what is required in his particular district and in those mines, than a new man who comes up for appointment or for election, as the case may be. The old mine inspector has adopted a system along the lines that have appealed to him; he has become familiar with the men in his district; he may have his enemies, of course; but if he is beyond the power of those enemies to do him harm, then he can do his work, and he will be a power in the up-lift of mining and in the development of safety. There is no question about that, in my mind, gentlemen.

I want to thank Mr. Roderick for his reference to what Coal Age has attempted and to assure him and you gentlemen, that Coal Age expects to continue that work. We have under consideration not only the appointment of mine inspectors, which we will continue to push until we can see some results, but other points, besides, that I believe will help to uplift and broaden the work of mine inspectors, in this country. One of the points to which I refer has been thrashed out, in Coal Age, recently, in respect to what is required in mining examinations, particularly; and we were snowed under with just what I supposed would come. However, we want to submit these questions for discussion, in such a manner that everyone will feel free to say what they think is right, and to argue the question from their own standpoint. Now, my opinion is only worth so much—your opinion is worth the same; but when you put these opinions against each other, and let each stand for what it is worth, a great deal is accomplished in broadening our ideas. * * *

These suggestions are not made hurriedly, but are the results of careful study and observation. While, for the past 18 years I have gone deeply into the theory of mining, my work for 19 years previous to that was spent in engineering and mining work. I have held every position in the mine and performed every task, except driving and digging; and the practical knowledge so gained has been a great help to me in studying mining questions, from a theoretical standpoint. My heart always goes out to the candidate who is a good practical man but has not learned much of the theory of mining; and I have tried to simplify for such, as far as possible, the question of what should be required of candidates in examination, in order to secure the best men for the positions of inspector, mine foreman and fireboss. While we cannot make a difficult thing easy, we can often simplify the matter, by putting the candidate under conditions with which he is familiar and to which he is accustomed in daily practice.

The work of making the examination more practical must be undertaken by degrees. In some of the states, the conditions surrounding the mining of coal are not such as to permit of a difficult examination being given candidates for the positions of mine foreman and fireboss. In every state, the examination must be adapted to the existing conditions. Where this has been done, in some cases, it has resulted in a shortage of men to fill the position of mine foreman, and it has even been necessary to allow an uncertificated man to fill the position temporarily.

Mr. Paul (*Pennsylvania*)—The question of selecting state mine inspectors is one of great importance, since the efficiency of the service to be rendered may be seriously impaired if the inspector becomes the tool of either wire pullers or mine operators, and, as a result, unduly compromises himself in the proper execution of the law. The qualifications should be capability, efficiency and aggression on the part of the inspector. While it is almost an impossibility to provide a means of selecting inspectors without the influence of some political or state governmental organization, the plan adopted should be such as to remove the inspector from such political influences, at least so far as his retention in the service is concerned. The election of inspectors appears to me to be a most unwise method of selection, especially if their tenure of office is such as to necessitate their frequent participation in political campaigns, in an endeavor to secure reelection. The sentiment of this Institute appears to be strongly opposed to the elective system, so it would appear that it would be proper for the Institute to take some action in the form of a resolution which will place the Institute on record as condemning the elective plan of selecting mine inspectors.

As a result of the discussion the Institute adopted the following:

RESOLUTION

Following an interesting and prolonged discussion of the methods employed in different states, for the selection of mine inspectors, the Mine Inspectors' Institute, U. S. A., in session June 11, 1913, at Birmingham, Ala., unanimously adopted the following:

Resolved—That in view of the nature of the duties imposed by law upon the state mine inspector, requiring him to act as agent for the state; and because the upright and conscientious performance of those duties often calls for the fearless, unprejudiced and unhampered exercise of an inspector's best judgment and convictions, in the face of threatening opposition of either operators or miners or both: Therefore be it

Resolved—That it is the sense and deliberate opinion of the members of this Institute, that the incumbent of the office of state mine inspector should be, as far as possible, removed from any influence that would tend to warp his judgment, or embarrass his conclusions, or in any manner delay his action in the interest of safety and security of mining operations under his direct supervision; and further,

Resolved—That, in securing this end, it is the unqualified opinion of this body that the elective system as applied to the selection of state mine inspectors should be condemned unreservedly and abolished. In conclusion be it further,

Resolved—That due publicity be given this action by wide-spread notice in the public press and mining journals, so as to bring it prominently before state legislators and governors, in the hope that such laws may be wiped from the statute books where they exist in any state, or may be killed if contemplated.

All mine inspectors are earnestly requested to draw the attention of the governor in their respective states to the above resolution.

POWER DEPARTMENT

Long-Distance Steam Transmission

By F. W. Brady*

SYNOPSIS—Long steam pipe lines are still extensively employed in the anthracite region. Many of the engineering problems encountered and solved in an installation of this kind are here enumerated and illustrated.

⁂

Out-door steam pipe lines are a common feature of the landscape in the anthracite mining district of northeastern Pennsylvania. Some of these lines being poorly constructed and proportioned for the purpose in hand result in a considerable loss of power with more or less unsatisfactory service. Others are of first-class construction, are kept in good repair, and their use appears to give satisfaction.

These long steam pipe lines in most cases continue to fulfill the needs of the anthracite field, and have not been generally replaced by electrical transmission to any extent. They are not considered relics of old-time mining plants where the system has been always used as a matter of course, but are features of the newest construction work.

The accompanying illustrations and sketches show two high-pressure steam pipe lines that are just being completed for the Harleigh-Brookwod Coal Co. by the Gaylord Engineering & Construction Co., W. H. Gaylord, Jr., consulting engineer. These lines are remarkable for their length, high-grade construction, and the numerous difficult engineering problems which were successfully solved in carrying out the power scheme.

The pipes are 10 in. in diameter, and are designed for a boiler pressure of 175 lb. per sq.in. One line is 4300

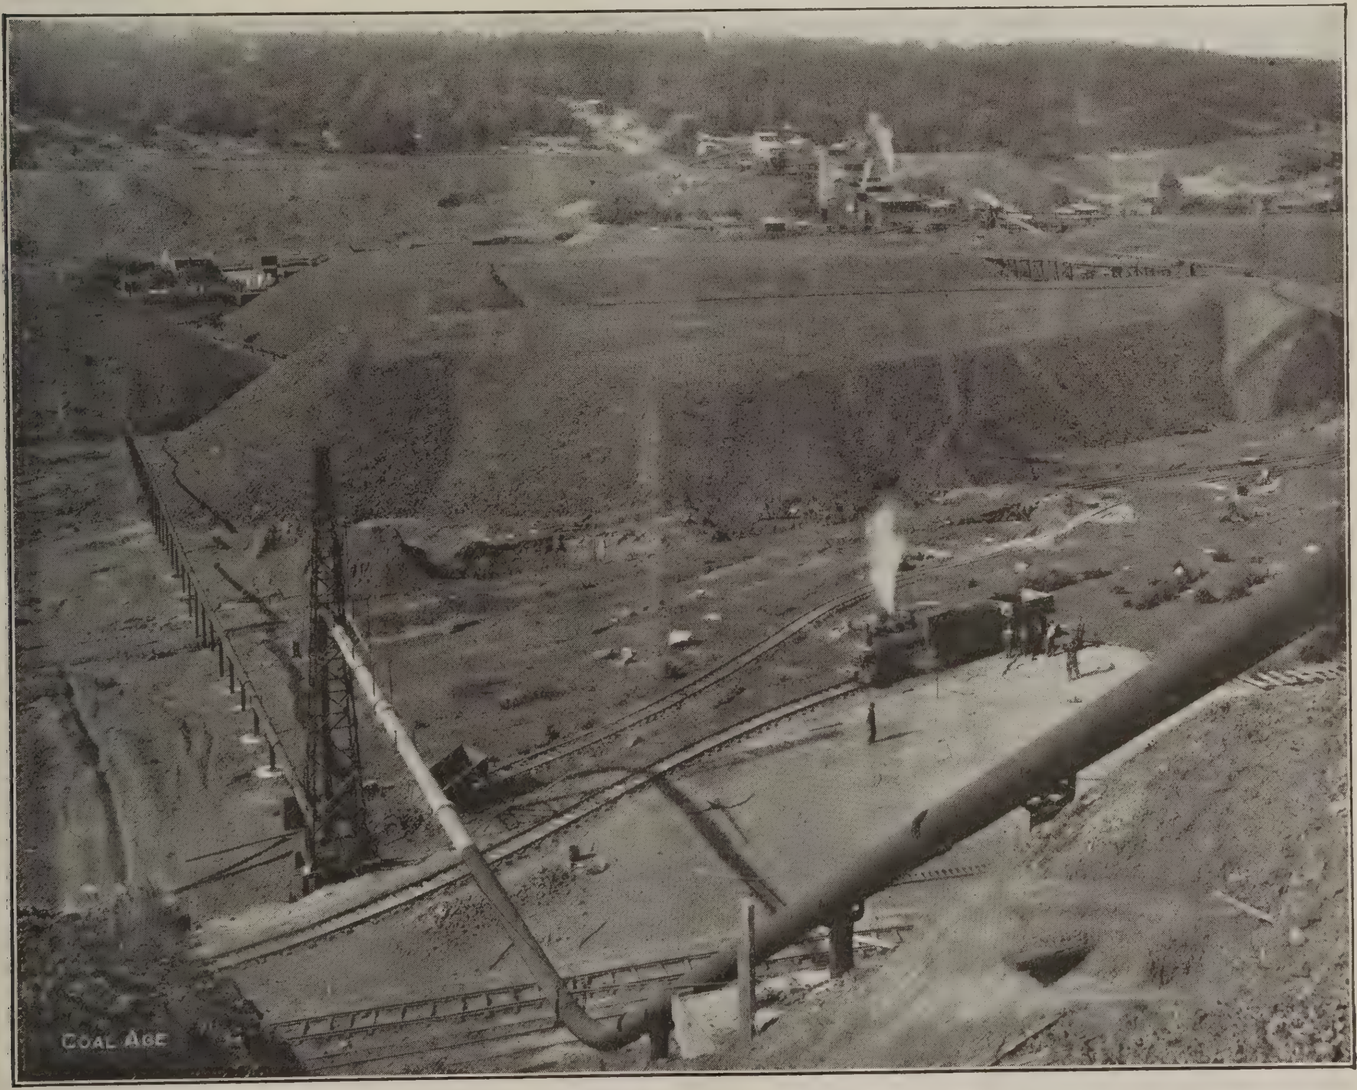


Fig. 1. General View of 10-In. Line 4300 Ft. Long

ft. long with 8-in. and 6-in. additional distributing pipes 1400 ft. long, and the other line is 7300 ft. in length. A general view of the 4300-ft. line is shown in Fig. 1, while Fig. 2 is a plan of the various lines and gives the location of the different shafts, breakers, etc., while Fig. 3 is a view along the 7300-ft. line.

---

*609 Gibson St., Scranton, Penn.

The purpose of the installation was to do away with ten separate boiler plants, which were more or less out of date, and much in need of repairs. The power is used for pumping, hoisting and breaker operation at several different mines.

Provisions That Must Be Made

In the construction of these pipe lines it was necessary to provide for a large amount of expansion, to prevent so far as possible undue condensation, and to provide means for removing the steam condensed, and for keeping the pipes in alignment on the irregularities of the mountain sides over which they were laid, for anchoring the pipes on the steep slopes and for elevating them where they crossed streams or the tracks of railroads.

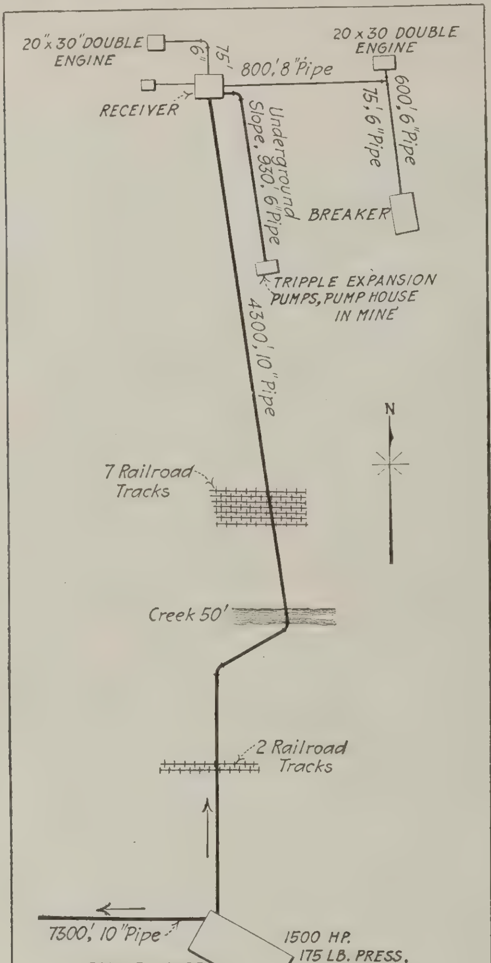

Fig. 2. Plan of One of the Pipe Lines

It was also necessary to prevent vibration of the pipe caused from the operation of the quick-acting throttle valves on some of the engines.

The 10-in. pipe employed is of the best quality of steel, weighing 40 lb. per ft. It is rolled in 40-ft. lengths and connected with Van Stone joints having extra heavy steel hubs and flanges. No threaded pipe is employed in the entire system. A triple copper gasket with red lead between joints is used in each flange connection, the joint being set up tight when cold.

Referring to Fig. 1, which is a view looking from the boiler plant, it will be seen that the 4300-ft. line drops into a valley about 150 ft. below the boilers, at the farther side of which it rises in the woods to a higher elevation than the boilers themselves. The extreme end of the transmission is at the coal breaker, which may be seen in the edge of the woods.

Fig. 4 shows the construction on the steep hill side next to the boiler plant, together with the form of steel tower used to carry the pipe over the railroad tracks. These towers have two sheave wheels over which pass cables that are anchored to the pipe forming a suspension bridge scheme of support. The double-tower suspension, where the pipe line crosses the seven tracks of the Pennsylvania and Philadelphia & Reading Rys., is shown in Fig. 5.

The terminal of the 10-in. line, the receiver and the four distributing pipes are shown in Fig. 6. The receiver, which is 4x15 ft., has welded necks with Van Stone flange joints for the pipe connections. Besides serving as a water collector the receiver acts as a regulator, preventing vibration in the 10-in. line from the quick action of the throttles on the engines above mentioned. An 8-in. feeder line weighing 28 lb. per ft. leads down a slope 930 ft. underground to a pumping station. Triple-expansion pumps are here installed to remove the water which has an estimated daily accumulation of 2,000,000 gal. The breaker at the extreme end of the 1400-ft. feeder is the farthest of any plant from the boiler house upon this line.

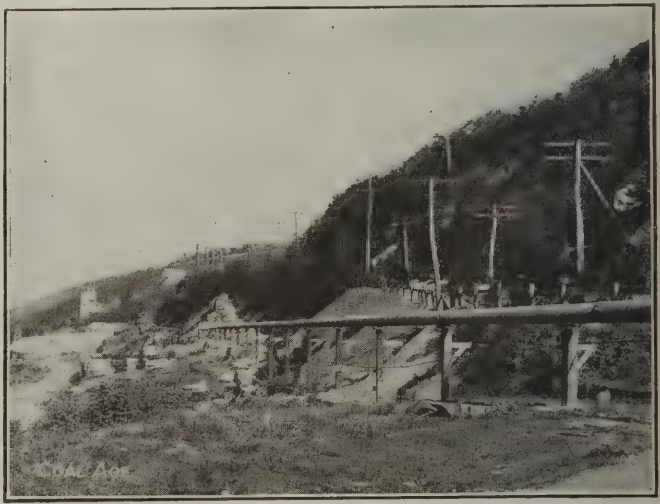

Fig. 3. View along 7300-Ft. Line

Swivel Joints Take Up Expansion

Expansion is taken care of by vertical and horizontal swivel joints as shown in Fig. 7. The details of the joints are shown in Fig. 8 and the flexible support for the pipes near them in Fig. 9. The special feature of the swivel is its 3 in. of longitudinal space for ring packing. This keeps tight while the ordinary style with only 1 in. space requires frequent renewal and constant care. The flexible hangers are made of 2½-in. pipe set in concrete foundations. There are four different arrangements of swivels used in the line so as to accommodate the deflection of the pipe at various angles in both the vertical and horizontal planes.

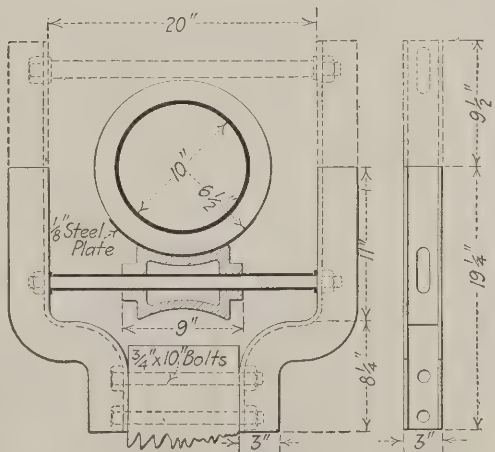

FIG. 11-PIPE HANGER AND SUPPORTS

Figs. 8, 9, 10 and 11. Details of the Pipe-Line Construction

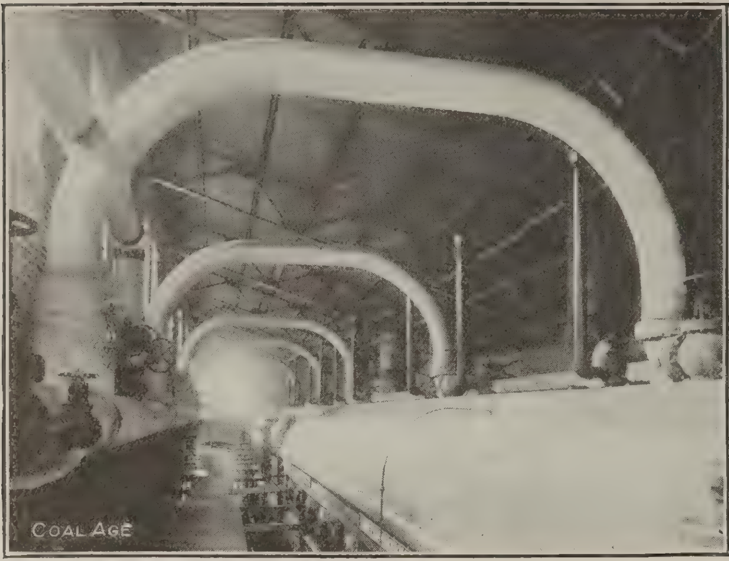

Fig. 12. Steam Header and Its Connections in Boiler Plant

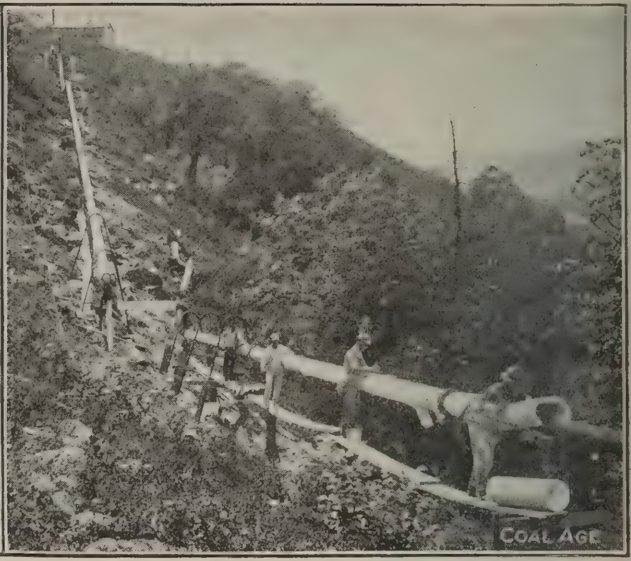

Fig. 13. Placing the Covering on One of the 10-In. Lines

Under the drop or downcomer at each swivel joint there is a drip pocket which is shown in detail in Fig. 10. The special feature of these drips is the large opening in the bottom, which is covered with a flange having the usual plug connection. This construction allows the drip to be cleaned thoroughly by removing the flange, the outlet of the ordinary form of drip usually clogging.

The regular supports and hangers along the line are shown in the several photographs and in detail in Fig. 11. They are made of 8x8-in. posts set in molded concrete foundations. This plan made the work of erection easy and promises that changes and repairs can be made with equal ease in the future. The yoke is made of 3-in. channels fastened to the top of the post with two ¾-in bolts, the pipe rests on a 3½-in. curved roller having a radius of 6½ in. This roller is fitted over a sleeve made of ¾-in. pipe, which is carried on a ¾-in. bolt. Every fourth support is double-decked as shown by the dotted line, so that a ¾-in. bolt can be passed over the top of the pipe. Special designs of brackets are used where the pipe must be supported on the side of the post.

A view inside the boiler plant is shown in Fig. 12. Here are installed five 300-hp. water-tube boilers set in battery and half battery, making 1500 hp. in all. The steam header is carried along the wall. It has welded necks with extra-heavy steel flanges for each boiler connection. Each steam feeder has a Jenkins stop and check valve at the boiler and a Best gate valve with bypass at the header. As above stated, the pressure carried is 175 lb.

The Pipe Is Carefully Covered

The insulation or covering of such long steam lines is an extremely important matter. The placing of this covering near the end of the 7300-ft. pipe line is shown in Fig. 13. It is made up as follows: 1½ in. of 85% magnesia, a cloth jacket, two layers of rosinized paper, 1 in. of hair felt, one layer of rosinized paper, and two thicknesses of weatherproofing, together with the various bands, wires, etc., required to bind this material firmly together, and about the pipe.

It may be seen, therefore, from the foregoing that steam transmission is not invariably discarded in favor of electricity in the anthracite region, that the many difficult problems of leading the pipe line across country, over streams and railroad tracks, providing for expansion and contraction, removing what small amount of water necessarily condenses from the steam, and holding this condensation to a minimum by means of a suitable pipe covering, are all problems which, in the case described above, have been successfully solved.

⁂

When to Cut Timber

By Ernest L. Bailey*

It seems probable that few mine managers appreciate the importance of having their mine timbers cut during the season of little or no sap, that is, from approximately the middle of December to the middle of February. This, of course, applies only to entry timbers or to those for which a long life is desired.

Dry rot is by far the most prevalent of any timber discease obtaining inside the mine workings, and not only is it the most common, but, once infected, there is no efficacious treatment for the diseased stick.

Dry rot is produced by the fermentation of the sap in improperly seasoned timber, beginning at the center and working toward the surface. Timber cut during the no-sap season and subjected inside the mine to even a slight air circulation is rarely affected.

The elimination of dry rot is even more desirable from a safety than from an economical viewpoint. The surface of the stick being the last part to be affected, an almost wholly decayed timber may present to the eye a perfectly sound appearance, thus giving the workmen, and frequently, no doubt, the foreman, a false sense of security, which has unquestionably been an important contributing factor in many fatal accidents.

The manager who now has his foreman prepare an estimate of the permanent timbers to be used during the coming year and orders the woodsmen to cut and store them in the proper season, will be taking steps to ultimately reduce his cost of timbering and also to safeguard the lives of his employees.

EDITORIALS

Two Phases of the Colorado Strike

"Life, liberty and the pursuit of happiness" are the inherent rights of all who live, dwell or sojourn within the confines of the United States. It would appear to be ridiculous that the miners of Colorado should declare, as one of the contentions for which their strike has been called, the right to board where they please, to buy their necessities or superfluities where and from whom it may suit their fancy. These are rights supposedly inalienable.

Another point for which it should be utterly unnecessary for the mine workers to contend is the enforcement of the laws of the state regarding mine inspection and hours of work. These are matters which primarily concern those who are intrusted with the enforcement of he statutes.

While the contentions of the mine workers cast insinuations upon both the executive branch of the state government and the business system of the operators, many of their methods in conducting the strike are highly reprehensible, as is evidenced by the recent findings of the Grand Jury. This body in returning ndictments against the strike leaders, charging them with conspiracy o monopolize labor, has made some pointed remarks concerning the importation of experienced or professional agitators, the furnishing of arms and ammunition to "irresponsible aliens," and the employment of methods "which all fair-minded labor organizations repudiate." One of the local labor leaders admitted under oath that he had personally given weapons to the miners at one of the tent colonies, many of whom were at the ime drunk and insisted upon immediately attacking the watchmen employed by the operators.

In arming foreigners unacquainted with our laws or customs, and whose idea of all government is that of a monarchy, these labor leaders launch a force, the amount and direction of which they admit they are unable to conrol. Under such circumstances, they should not be surprised at any far-reaching results which may follow. Almost anyone can kindle a fire; it may require several ngine crews to extinguish the resulting conflagration.

⁂

The West Virginia Coal Mining Institute

The struggles and the strifes of West Virginia have been a matter of recent national history, and most of what the public heard relative to those ugly occurrences ame through Charleston, W. Va. The quarrel is far rom settled; the men in one camp have already broken heir agreement and are seeking a new one, and everyone xpects a recurrence of violence.

Yet a trip to Charleston to a meeting of the operating forces in an institute assembled revealed no sign of any apprehensions or festering animosities. Most creditable to the executive heads of West Virginia is it that despite a continued outburst of public condemnation, misrepresentation and scandal, there is now little sign of anger or retaliation. One compares with wonder the quiet of the meeting in the Y. M. C. A. building at Charleston, with the orgy of hate, violence and malice at Carnegie Hall, New York City, when that Jones woman, interesting and clever, preached her story of discord.

Mrs. Jones—we will not dignify her with the title she assumes, "Mother Jones"—and her followers have failed to disturb the serenity and determination of the West Virginia operators. While she has talked guns, they are discussing schools and seeking to do their whole duty to their employees. The future will record the success of the West Virginia operators in suppressing disorder.

There is no other way of winning back the state to public confidence, and it is pleasing to see that the operators have chosen it. In all the papers and discussions not one word was said which would have brought a smile or caused a frown to gather on the face of any mine worker. The favorable audience which Dr. Ira D. Shaw, of the Y. M. C. A., received and the prolonged applause when the prohibition amendment to the constitution was but casually mentioned shows that the West Virginia operators are determined to remake the state and set it right.

Coal Age
Wishes Everyone a
Merry Christmas

But from these quiet men, one turns uneasily to those unquiet souls, probably just as determined to seek the right as they have light to see it and know it as the operators. The need is great to establish in them a degree of character that will make such scenes of violence, as West Virginia has recently witnessed, impossible. Can this ever be done by inciting each and every man to be a mine official, a foreman or a superintendent? A propaganda of education which urges every man to seek to dominate his peers is ill-suited to this 20th century.

The duty of creating a desire for comfortable, clean and happy homes, good citizenship, thrift, sanitation, wholesome cooking, sobriety, decent living, first aid, rescue work and like matters, is indicated by all the symptoms of the West Virginia unrest. Let no one decry ambition, but if a man is willing to continue to be a miner and make more money than his foreman, why urge him to change? Teach him track laying, coal shooting, timbering, safety, economy and efficiency in mining, so that he can earn for himself and society a better living. It is a fact that he will be more adequately rewarded and find life easier if he remains a miner and does not put himself where the state, the operator, and the employee can combine by their reproaches to make life unendurable.

In England today the county councils' lecturers are teaching hygiene in every village. In any coal camp it would be better to teach that science than the hydraulies of mining. We rejoice to hear that Anna B. Scott has been teaching simple cooking in the Winding Gulf section, and inculcating culinary economy to the native miners' wives. The lessons, simple and fundamental, have had remarkable results. The miners in the mountains of West Virginia have hitherto not only been served with poorly cooked food, but the work has been done in the most wasteful way and Mrs. Scott has set herself to meet the difficulty in a practical manner.

The mountaineer needs much development, and some at least of the operators seem decided he shall have it. We hope that they will conclude not to develop only those who have a facility for mathematics and other book learning, but will seek to extract the best from every man and every woman in the community. If we desire juries to be just, if we would replace politicians with statesmen, if we seek to make union officials serve the best interests of their men, if we would have reason and efficiency at our mines, we must create character. When the laws are inefficient and flouted, where anarchy rules, there the need for ideals and self-constraint is most felt and unhappy is the operator who meets force with force and has not learned the more American method, education.

⁂

The Greatest Cause of Mine Accidents

In mining, as in many other industries, the vast majority of fatal accidents occur from one or more of three causes, ignorance, indifference, disobedience.

Many of our mine workers, being more or less inexperienced are often downrightly ignorant of dangerous conditions. Others, even though experienced, and thoroughly realizing that they are in danger, evince a strong spirit to put off "until a more convenient season" the time of making adequate provision against a known risk.

The third class are those who tacitly disobey the instructions of their superiors. When told to take down a certain piece of slate or to set a prop in a certain locality, these men finish loading a car or cleaning up a place before proceeding, perhaps leisurely, to carry out instructions, or they may even leave the mine without performing the duty at all.

One of the best methods that has hitherto been devised for forestalling these evils is the appointment of a sufficient number of subforemen so that each may have only a limited number of men under his care. This number, of course, varies with the conditions and layout of the mine, but should be such that he can visit each working place every few hours.

These assistant mine foremen are to a large degree safety specialists. When a dangerous condition is discovered, it is the duty of the subforeman in whose district it occurs, not only to instruct the miners to rectify the condition, but to remain and see for himself that his instructions are immediately and implictly obeyed.

It is at once apparent that so long as human nature remains human nature, all accidents can by no means be eliminated either in mining or any other industry. Strive as we may for a clear accident record, we will still be confronted by lapses of discipline which result fatally. The fact remains, however, that the above system, where it has been adopted and conscientiously followed, has been extremely fruitful in reducing accidents. One firm, of which we have knowledge, has succeeded in reducing accidents upon a tonnage basis by means of this system somewhat over 60 per cent.

Great as have been the strides toward safety accomplished by this system, however, fully one-half of the accidents still occurring in this firm's operations are due to lapses of discipline, to the apparently irresistible tendency of all underground workers to procrastinate, to gamble with fate and take a chance.

⁂

The "Mine Workers" and Their Contracts

The United Mine Workers of America has proved beyond doubt that as an organization it is a body without responsibility. By countenancing the continued violation of labor contracts with the anthracite and bituminous operators in Pennsylvania, the officers of the "Miners' Union" have made a most serious mistake, and one that reflects on their honor and sincerity, as well as their business judgment.

For more than a year the anthracite-coal companies have remonstrated in vain against the many serious "button strikes" in the hard-coal region. It has been left to the bituminous operators of central Pennsylvania, however, to call for a show-down, which is done in their 10-day ultimatum published on p. 929.

In such matters as this, public opinion will always ultimately control and determine the issue, and as a consequence, there can be no doubt of the outcome. All fair-minded people are certain to protest against the attempt of the miners' organization to make contracts and immediately thereafter repudiate all that is binding in their part of the agreement.

We believe in labor unions, and we are sure that, when properly conducted, such organizations are beneficial to society as a whole. It is also proper that those who represent a body of workmen in any industry should conclude the very best bargain in the matter of wage agreements that it is possible for them to obtain. But when such a contract is finally made, there should be no violation of its terms.

The present policy of the "Miners' Union" is one of which they should be ashamed. They are striking at the heart of their own organization. Mr. White, Mr. Gilday and other union officials will have nobody but themselves to blame if their present dishonorable plan of procedure proves disastrous to the campaign of organized labor in the coal industry. No social movement can succeed unless based on justice.

⁂

May the Pot Call the Kettle Black?

The Delaware, Lackawanna & Western R.R. Co. was recently compelled to pay a fine for having committed the legal misdemeanor of hauling its own hay over its own railroad in order to feed its own mules in its own mines.

Provided that the present agitation for a Government railroad and mines in Alaska is successful, and that the road is finally built, and the mines opened, it would be interesting to know in what light the courts will view the action of the Government in transporting its own coal produced in its own mines, over its own railroad, to supply its own Navy.

SOCIOLOGICAL DEPARTMENT

How Breathing Apparatus Works

SYNOPSIS—An elementary and detailed explanation of the manner in which the Westfalia apparatus is constructed and how it works.

⁂

The purpose of artificial-breathing apparatus is (1) to supply the wearer with oxygen and (2) to absorb the carbon dioxide and moisture which he exhales. These two requirements fulfilled, he can safely penetrate any area containing an unbreathable atmosphere. These needs are met by the Westfalia apparatus by (1) cylinders filled with oxygen, the supply from which is regulated by a reducing valve; (2) breathing bags large enough to regulate by their capacity the supply to and the discharge from the lungs; and (3) a metal container filled with chemicals for the absorption of carbon dioxide and moisture.

Rubber Parts in Front, Metal Parts in Rear

The apparatus is distributed on the front and back of the rescueman; that part which is of rubber is placed in front for better protection, and the metal parts, such as the oxygen cylinders and the regenerator, are placed behind. The hose pipes protected by wire reinforcement are all in front or under one arm. All the pipes on the back are of metal.

In the diagram, to make matters plain, the parts worn in front are placed on the left, the parts under the arm in the center and those worn on the back on the right. The breathing bag has been represented as cut open, so as to show the hose pipes which pass into it by air-tight connections. The only other parts in section are the regenerator and injector. It should also be stated in passing that what we shall call the left-hand compartment of the breathing bag is that to the left hand of the wearer and appears as the right-hand compartment in the diagram.

The Course of the Air and Its Purifying and Enrichment

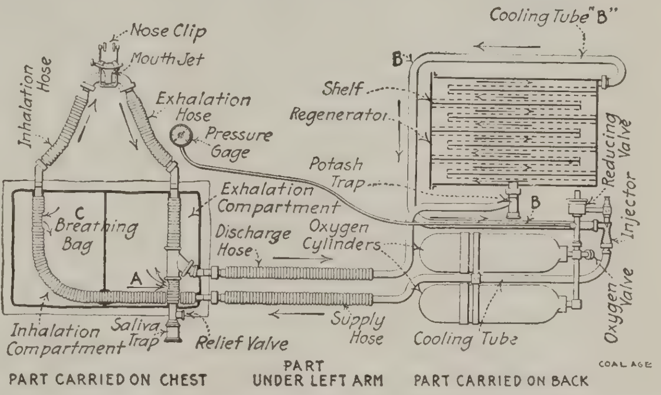
The illustration shows the circulating system of the air and oxygen in the Westfalia apparatus. The air which the rescueman discharges from his lungs goes through the exhalation pipe in front of his body into the left-hand compartment of the big breathing bag, which he carries on his chest. It passes into this bag, but the pipe is unbroken except for a slit *A*. If the air is entirely unobstructed, all of it goes forward into the discharge hose, which is passed under his left arm to the back of his body.

If, however, the air exhaled does not pass away immediately, as is always the case when the rescueman is making a full breath, some passes through the slot *A* into the exhalation compartment of the breathing bag and is stored up so that when the man is inhaling, this air can still continue to pass on. Why it is necessary to have this bag and why it is not connected to the air line with valves will be explained later.

We have traced the air into the discharge hose, by which it passes under the left arm of the rescueman at a point near his waist. It is then carried to the regenerator on the upper part of the man's back and circulates back and forth till it reaches the top of the regenerator, its moisture and carbon dioxide being absorbed by the potash on the various "shelves." It then passes, by a cooling pipe *B*, over and alongside the regenerator and then below it to the injector.

The Injector

This injector is just like a steam inspirator, with this sole difference that oxygen is used to do the injecting. A small jet of oxygen is passed through a passage, which gradually narrows and then widens out to the full diameter. The speed with which this oxygen travels into this narrow space causes the purified air to enter the narrow pipeway and then drives the air now both purified and enriched with oxygen back through a pipe between the two cylinders of oxygen to the flexible supply hose, which passes under the left arm into the right or inhalation compartment of the breathing bag.



Diagrammatic Illustration of Westfalia Breathing Apparatus

This pipe passes through the exhalation compartment on its way, but is air-tight in this part of its course. When it reaches the inhalation bag it is slit at *C*, and the air can pass right on to the rescueman's lungs if he is drawing in air, but if he is compressing his lungs, the air will go into the breathing bag and be stored up there until he is ready to draw it in. Then the air will return into the slot *C* and proceed by the inhalation pipe to his lungs.

The Oxygen Cylinders

In this manner the air passes continuously round in a circuit, being purified by the potash and oxygenated by the gas escaping in due proportion from the oxygen cylinders. Two of these are used so that the weight is distributed more evenly on the back than it would be if only one large one were installed.

Nevertheless, one cylinder is not exhausted before the other is emptied, but oxygen from both these cylinders is used at the same time and the pressure is measured by one and the same pressure gage. The oxygen is maintained at a pressure of 120 atmospheres, or 1733 lb. A single automatic reducing valve serves for both cylinders and is so arranged that the injector jet can be inspected without removing the valve from the apparatus. As the 120-atmosphere charge is sufficient for two hours, each atmosphere furnishes enough air for one minute, and the pressure gage is graduated according to that principle.

Oxygen Is Purified by Three Filters and Pressure Is Reduced to 72 Lb.

In passing from the cylinders to the reducing valve the oxygen is filtered through three sets of gauzes and felt washers so that it is impossible for any dirt or impurities to enter and clog the injector, so long as these gauzes are kept intact. The reducing valve makes a reduction in the pressure to about 5 atmospheres, or 72 lb., and is so arranged that even when the pressure in the cylinders drops down to 8 atmospheres, the pressure of the escaping oxygen is nevertheless still the same.

This oxygen flows through an extremely small nozzle, and being at the pressure described, has considerable velocity, which is utilized to promote circulation through the apparatus. The nozzle projects slightly into the trumpet-shaped opening forming an injector. The oxygen passed by the apparatus is 60 liters, or 2.1 cu.ft. per min.

The Breathing Bag

The inhalation compartment of the breathing bag stores up air ready for the deep breath or for extra demand in case of more than ordinary exertion. The bag is, in short, the regulator which turns an alternate action into a continuous one. The inflation and contraction of the lungs are reciprocating actions, and to supply and receive the air from these pulsations by a continuously working apparatus, a storage chamber is necessary, and the breathing bag serves that purpose just as does the air reservoir on a water pump.

The supply and discharge tubes, as has been said, are both connected at the bottom of the breathing bag on the left side. This obviates the need of making any connection in the apparatus after it is put on and also allows each man to examine and test the complete circulation of his own apparatus.

Why Hose Pipes Pass through the Breathing Bag

It has been noticed in this article that the hose pipes pass through the breathing bag. The advantage of this arrangement is that even if the rescueman lies down on the bag the air will not be entirely shut off and the bag will be held open so that it will have some available capacity. The man will still be able to breath freely despite his prone position. The breathing bag serves as a storage reservoir at all times; the exhalation compartment fills up and gives a steady supply of foul air to the regenerator for purification. The breathing bag is protected from being torn or cut by means of a leather cover, which is attached with straps and swivels to the shoulder straps and back carriage and is sufficiently free to allow unrestricted expansion.

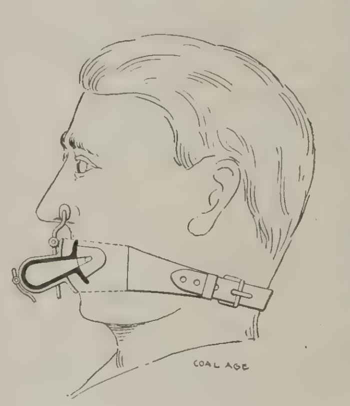
By having the hose pipes within the breathing bag the connection between them and the bag is made more simple and no valves are required. The arrangement works, therefore, without unnecessary loss of power.

The hose which connects the breathing bag with the face piece is made extremely flexible and can be quickly put on, as it is only necessary to fit the helmet on the head or place the mouth piece in the mouth and screw up the nose clip to be ready for instant service. This ability to put on the apparatus rapidly is of considerable importance in an emergency.

The Regenerator

The regenerator, as has been said, has "shelves," but the potash is placed both above and below them, being held in place by wire gauze. This gives the material a large area of contact with the circulating current.

Where the regenerator has been roughly handled or sent by train or motor car without proper packing, minute particles of the chemical will occasionally sift out of the wire cages and fall into the bottom of the regenerator. In order to prevent this dust from blocking the air entering the potash cartridge, a trap has been fitted to the pipe, by which the air is conveyed. The regenerator can be quickly exchanged or refilled, either the interchangeable or refillable type being furnished, as may be desired.



The Face Piece

The Oxygen Gage

The gage is carried just below the left shoulder in a leather case, forming a part of the harness. By unbuttoning a flap the gage can be taken in the hand and examined. The oxygen is carried from the cylinders to this gage by a small, heavily armored rubber tube passing under the left arm. It is well protected by the apparatus where it crosses the back, and, as it passes closely under the arm pit, it cannot catch in obstructions.

Many authorities believe that pressure gages should be kept close to the oxygen cylinders, feeling that flexible tubes are undesirable as conductors of any fluid at pressures of 1733 lb. When carried on the back the pressure gage can be placed below the regenerator and above the oxygen cylinders, so as to receive the protection of both. The makers of the Westfalia apparatus are quite willing to provide such an arrangement, as they believe the argument is in favor of this location for the gage. When set at the back, it is placed in a metal framework, the front being adequately protected by a metal shield.

There is this strong argument in favor of the rearward position. Rescuemen never travel into a mine alone, so it is easy for each rescueman to watch the gage on the back of his comrade. However, most users of apparatus would feel better satisfied if they could read the record of their own pressure.

Why the Air Circuit Never Reverses

There are no valves in the system, but rebreathing any of the exhaled air until it has passed through the regenerators, is impossible. Yet this result is obtained without the use of valves in the air passages. Such valves are apt to become choked with saliva, especially when the mouth-breathing apparatus is used.

There is always a higher pressure in the inhalation than in the exhalation pipe, so that when the rescueman expires air, it goes to the pipe with the lower pressure, namely, the exhalation pipe, and when he draws his breath, the air inspired comes from the pipe which is at higher pressure, to wit, the inhalation pipe. The injector thus determines the direction of flow, so that it is impossible to reverse the circuit.

The connections between the regenerator and the breathing bag on the purified-air end are quite lengthy. This is done to cool the air heated by the chemical actions taking place in the regenerator.

⁂

Domestic Science in Mine Camps

Mrs. M. B. Scott, of Philadelphia, Penn., a famous culinary expert, has been teaching cookery at the little town of Tams, Raleigh County, W. Va. She was introduced by an officer of the mining company and declared she could make a good dinner for 4 men for 50c.

Four men were chosen having exceptional appetites. The meal opened with a beef stew, the meat of which cost 18c. As potatoes were expensive, Mrs. Scott replaced them by dumplings, at 4c., including parsley and other seasoning. A soup of stock cost 3c. and a can of peas 6c. For dessert, Indian pudding was served, at a cost of 5c. and the coffee for the four men cost 7c.

On the second day of the demonstration a larger building had to be used to accommodate the crowd. Mrs. Scott has taken a young woman from Tams to Philadelphia, to give her a thorough training in domestic economy. The student's expenses will be borne by the operators.

⁂

Be Careful

By Alabama Superintendent

The day after a recent mine explosion, the following editorial appeared in a Southern newspaper:

> For a number of years the matter of safety in mines has been given close study by leading experts among miners, operators and governments. Numerous appliances and methods have been devised and suggested in seeking a solution of the problem and some progress has been made. Yet the tragic event of yesterday in Alabama demonstrates afresh that there remains room for improvement.

In the same issue of the paper above quoted, a statement is made that coal is shot "on the solid" by black powder. Why not meet the issue squarely instead of looking for undiscovered causes for such explosions. More attention should be given by the miner, the operator and the government, to the enforcement of rules already in force. When the miner knows that he must obey certain fixed rules and the operator knows that he also must keep his mine safe, then only will the number of mine explosions be decreased.

If the miner is allowed to put two kinds of powder in the same shot; fire shots without tamping them to the end of the hole; make up black-powder cartridges with an oil lamp on his cap; keep explosives and exploders in the same box; walk past danger boards or shoot off the solid, is there any need to look further for the cause of explosions?

If the operator allows his miners to shoot "on the solid" with black powder, or if he permits gas to accumulate in old or new workings; if he countenances the driving of rooms 200 ft. up a 15-deg. pitch in a gaseous mine omitting crosscuts to keep down the cost, or the building of overcasts of 1-in. boards which will burn like paper, is there any reason for further talk on causes of explosions?

These are only a few of the many reasons why explosions occur.

Mr. Miner, are you violating any of the company's safety rules? Mr. Operator, are you keeping your mine safe and using safe mining methods? If you are, then ask the experts to look for new causes. If you are not, then put the blame on yourselves and get to work along safer lines.

⁂

Private Coal Cars

Investigation of the private car lines by the Interstate Commerce Commission calls attention to the coal cars owned by companies operating independently of the railroads. The attitude of the car-owning coal companies remains to be defined in the inquiry under way.

The coal cars of private companies constitute a small fraction of the total coal cars of the country. This is a different condition from the refrigerating situation, where the latest estimates of the commission indicate a percentage of ownership of about 50 per cent. for the railroads and the companies, where each own about 50,000 cars. Tank cars are 39,000, of which 9000 belong to the railroads.

The following figures are for the coal lines indicated:

Atlas Coke Co.	60
Baker-Whitely Coal Co.	150
Berwind-White Coal Mining Co.	*3,000
Boomer Coal & Coke Co.	500
Ellsworth Coal Line, C. P. R.	780
Jamison Coal & Coke Co.	1,500
Keystone Coal & Coke Co.	201
Lehigh Coal & Navigation Co.	100
Logan Coal Co.	150
Loyal Hanna Coal & Coke Co.	502
Morrisdale Coal Co.	150
Moshannon Coal Mining Co.	152
New England Coal & Coke Co.	400
New River & Pocahontas Consolidated Coal Co.	1,000
Penn Gas Coal Co.	1,418
Pennsylvania Coal Co. (Erie R.R.)	7
Pennsylvania Coal & Coke Corporation	†700
Pennsylvania Ontario Coal Line	412
Pittsburgh-Buffalo Co.	399
Pittsburgh Coal Co.	625
Quemahoning Coal Co.	400
W. J. Rainey	713
United Coal Co.	1,009
Vinton Colliery Co.	200
Washington Coal & Coke Co.	553
Westmoreland Coal Co.	2,101
Total	17,182

*Estimated. †Leased or controlled.

All repairs are at the charge of the owners. The cost of coal cars averages $700. Private car companies are paid 6 mills a mile for the use of their cars. The average time of a return trip of the cars to the mines from tidewater is fourteen days. The average haul is 300 miles to tide. This makes the return on the cars $1.80 a trip and $3.60 for the round trip. Average rates of freight in this district are for anthracite $1.40 a ton for prepared sizes, and $1.25 for steam sizes. For bituminous coal the rates are $1.55 a ton to South Amboy, Port Reading and Elizabethport, and $1.60 to Port Liberty. Boat charges from the lower ports are 18c. a ton and from Port Liberty 15c. a ton. Coal rates over the country show greater cost for anthracite than for bituminous.—*Wall Street Journal.*

DISCUSSION BY READERS

Working Coal under Sandstone Cover

Letter No. 8—Replying to the request for suggestions in reference to the best method of working coal under hard sandstone cover, Coal Age, Nov. 15, p. 745, I would say: Assuming the mine is already developed, the rooms driven up and the work "standing on pillars," as describer by Mr. Anderson, the question presented is how to draw back the pillars in a manner that will avoid a possible squeeze and the consequent loss of pillar coal. To do this and to enable one to control the squeeze should one start, I would suggest the following general method:

As shown in the accompanying sketch (Fig. 1), the pillars should be worked back in sections of three, four, or even six rooms apiece, the gob line in each section being kept about 150 ft. in advance of the line in the next section following. My reason for this suggestion is that, should any fall or trouble occur in one section, it will not result in tying up the entire line of pillar work until the fault is remedied. Where the line is continuous any slight accident at one point would affect the entire gob line and greatly reduce the output of the mine and increase the expense of operation. On the other hand, by keeping a step of 150 ft. between two sections, as *A* and *B* (Fig. 1), the trouble is localized and work in other sections is uninterrupted. At *C*, I have shown a section of rooms advancing, which, of course, does not pertain to Mr. Anderson's present proposition.

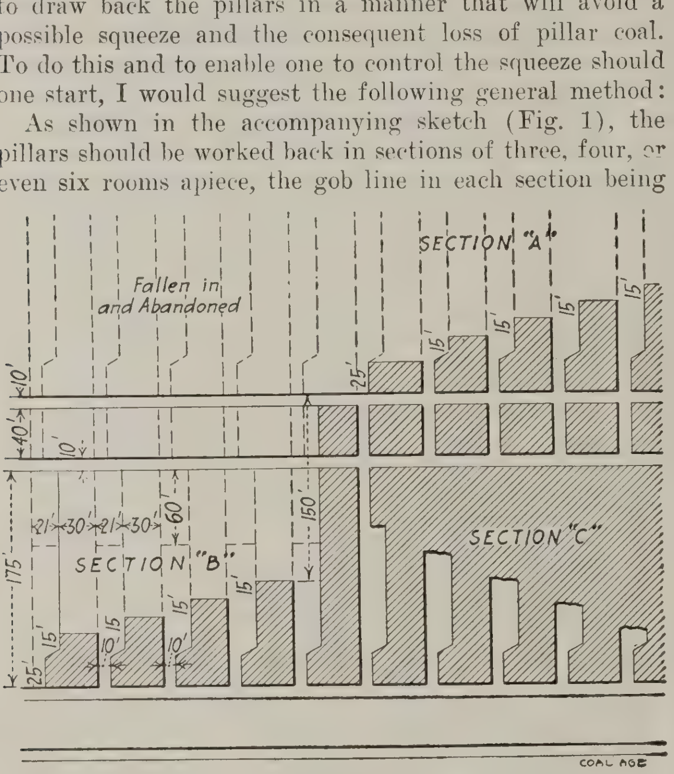


Fig. 1. Proposed Plan of Drawing Pillars in Sections

An important point that will greatly assist the ventilation of the mine and should be adopted in any new development is that the cut-throughs in adjoining pillars should never be opposite one another, but should be "staggered." For example, the cut-throughs, as measured from the entry in room No. 1, center to center, are 70, 140, 210, etc., ft. In room No. 2, these distances are 35, 105, 175, etc., ft. In room No. 3, they are the same as given for room No. 1, and thus continue to alternate in each consecutive room.

Another important point has reference to the extraction of the chain pillar. This should not be split, as is often done, but chutes or rooms should be driven up through the pillar in consecutive order and located so as to line up with the regular rooms. It should be remembered that many a squeeze is started by the extraction of the chain pillar. It is important, also, to give proper attention to the drainage of the mine, so as to keep the rooms dry, especially if the bottom is soft. Another important feature is to consider the width of each separate step or slice taken off the ends of the pillars in the several sections. I would not advise a greater width than 15 ft., under ordinary conditions. I have seen the method, as outlined, worked successfully. It requires close attention, however, on the part of the mine foreman to see that the crosscuts in the butt headings are correctly measured and correspond to the rooms turned off the butts, so as to preserve a uniform straight line of rib.

For the mine described by West Virginia Engineer, I would suggest the adoption of the same plan as outlined above, except that where practicable I would vary the room centers so as to proportion the width of pillar to the depth of cover. Thus, under 400 ft. of cover, 60-ft. room centers could be used, which could be increased 10 ft. for each 100 ft. additional depth of cover.

Pennsylvania Superintendent.

Oliphant Furnace, Penn.

⁂

Letter No. 9—I was much interested in the inquiries of W. F. Anderson and West Virginia Engineer, in respect to working coal under sandstone cover, and would like to give my own experience in similar work.

First, in regard to Mr. Anderson's mine, I consider 30-ft. pillars are too small for safe and efficient working under such conditions as he describes, especially as the sandstone roof is apt to crumble on exposure to the air. However, as this mine is largely standing on pillars, it is too late to discuss that aspect of the question. What must be considered now is, how to draw back the pillars, so as to obtain the largest recovery of coal, with safety.

In drawing pillars, under these conditions, I would take the coal out in two separate benches wherever the thickness of the seam was greater than 6 ft. Start at the upper end and drive a crosscut through the 30-ft. pillar close to the barrier, taking only the six feet of coal next to the floor. The width of the crosscut should not exceed 12 ft. In driving the crosscuts in the bottom coal, the place should be well timbered with posts set in regular rows parallel to the face. It is my experience that, in general, if plenty of timber is used in the first working, it can be almost wholly recovered in good condition. In some instances, I have seen entire pillars removed with the use of no new timber except that required for the working of the first slice or skip. This is a great saving in districts where the cost of timber is a large item in the expense account. In the present case, I would set the first row of timbers as close to the face as possible, and space the other rows not to exceed 2½ or 3 ft. apart.

Having thus crosscut the pillar in the bottom coal, I would set two or three long props with good cap-pieces against the sandstone and proceed, then, to take out two or three rows of the props supporting the top coal and permit it to fall. A little experience will be required to ascertain the best amount of top coal to drop; and it is in this part of the operation that good timbering in the first working is of the greatest advantage. If the timber is well set and in sufficient quantity, the last row left standing will always act to break the roof coal, which will drop without trouble. On the other hand, if the place is not sufficiently timbered the roof pressure, instead of acting to break the coal, may work back and destroy the props which are too weak for its support. When the top coal has been loaded out, two or three more long props can be set to support the roof. All that is required here is sufficient timber to prevent the roof caving too close to the pillar, which would cause loss of time and make the work more difficult, besides producing dirty coal.

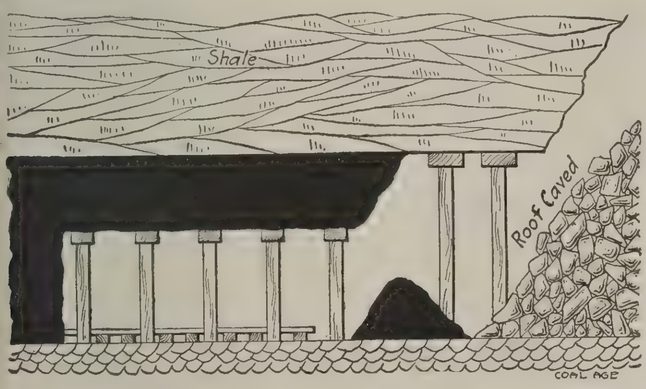

Fig. 2. Section Showing Support of Top Coal

When the work is well in progress, two miners can drop and load from 8 to 12 tons apiece a day. Allowing, then, 30 cu.ft. per ton of coal in place and estimating on 4 ft. of top coal, the weight of coal dropped in a single crosscut 12 ft. wide and 30 ft. long will be $(12 \times 4 \times 30) \div 30 = 48$ tons, which would give two miners work for from three to four days.

It is not advisable to crosscut the pillar a greater width or to take off a slice of coal wider than 10 or 12 ft. at a time, for the reason that the timbers on the goaf side are too far from the solid coal and are apt to be crushed before they are drawn. Moreover, too long a time would be required for driving a wider crosscut and trouble would result from the settlement of the roof too heavily on the timbers. The work requires considerable experience, and I have found it best to keep regular men employed on this work. When properly executed, the work is easier than ordinary hand mining. It may look dangerous to one unfamiliar with the system; but I have found the work can be more safely done and better results obtained when the coal is thus removed in two benches.

I have shown in the accompanying figure (Fig. 2) a section taken across the pillar separating two rooms and showing the top coal supported on rows of posts. Two long posts are shown supporting the sandstone roof beyond the top coal.

The case of the West Virginia Engineer differs from that of Mr. Anderson's in that the roof is a hard sandstone, which I consider is a battle half won. Since a soft bottom and small pillars generally spell disaster, I would lay out the mine, in this case, with pillars not less than 70 or 80 ft. square. The main roads and air courses should not be more than 12 ft. wide, while the ordinary stalls should not exceed 18 or 20 ft. in width. There is no economy in driving stalls wider than this, as it increases the cost for timber and subsequent upkeep and repair, while there is gained thereby but a few extra tons of coal, which would not be lost by making the pillars a suitable width.

In drawing pillars, in this case, I would take the full thickness of the seam, in one working. As each slice was taken off, I would draw as much of the timber as possible and allow the roof to fall before starting the next slice. By so doing, the pillar coal is relieved of excessive weight and the coal is more easily mined and in better condition.

James Dickson.

Nanaimo, B. C., Canada.

⁂

Letter No. 10—Having had a number of years' experience in drawing pillars in a mine, under a solid sandstone roof of 40 ft. in thickness, with a bottom that gave some trouble by heaving, I was much interested in the inquiry of West Virginia Engineer, relating to such work. In our case, we found the best method to employ was to drive the headings to the boundary line. These headings were driven from 12 to 14 ft. wide, and the chambers were turned on 50-ft. centers. The chambers were 24 ft. wide, making the width of the room pillars 26 ft. The pillars were crosscut every 50 ft.

As shown in the accompanying sketch (Fig. 3), a solid block of coal was left between each set of five chambers. This coal was to be worked when coming back. When the work had progressed to the boundary line, or barrier pillar, the robbing of the pillars in the first five chambers at the inby end of the heading was commenced. The system gave good success and little coal was lost. At times, the roof would not cave until we had taken out the full length of three pillars. It would then break off at the pillars, leaving it in a condition that, by setting a few props, we could get out that pillar and then get back at the next one. In this system, we did not have to use many props in driving up the chambers; but when

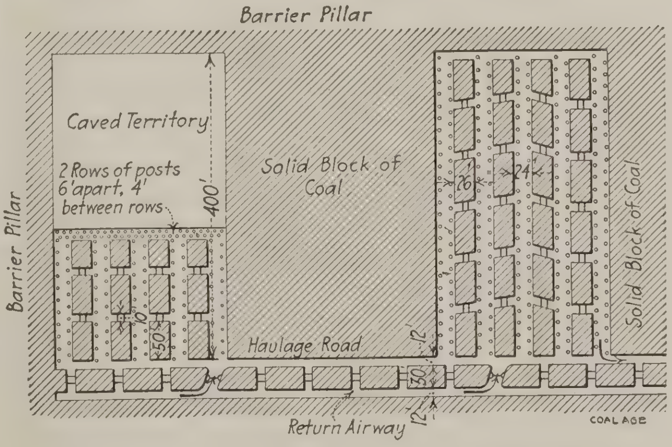

Fig. 3. Drawing Pillars in Panel System

starting to draw back, we would set timbers at the end of every pillar, across the entire place, as I have shown in the sketch, in the inby section where the pillars are being drawn (Fig. 3).

Owing to the strong roof, the chambers were turned their full width and the track was carried up as close to one rib or side of the chamber as possible, so as to be convenient for loading the coal when robbing that pillar. These chambers were driven from 400 to 600 ft. long. At times, we would bring back 10 chambers or two sets of rooms at a time; but the best results were obtained when each set was drawn back separately. The most competent and reliable men were employed on this work, four men working on each pillar—two miners and two laborers. The four men would put out 12 cars a shift. The seam made little waste and this was thrown on the opposite side of the track from the pillar to be robbed. Heavy props were used, varying from 12 to 16 in. in diameter. Overlying this seam was a cover, varying from 100 to 350 ft. thick.

In the seven years I was robbing pillars, in this mine, we lost not over 3 per cent. of the coal; and it is my opinion that if this system is followed of driving the headings to the boundary before starting to rob, 85 per cent. of the pillar coal can be reclaimed. After the room pillars have been robbed, each solid block of coal is worked out and the pillars drawn in turn. The entry pillars ar drawn back as each section is finished.

Thomas R. Pierce,

Scranton, Penn.

⁂

Loss in Pillar Work

In my recent article on the method of drawing pillars in the Fairmont region, published Nov. 22 in Vol. 4, p. 762, I note that the introductory synopsis stated tha only about 2 per cent. of the coal was lost in pillaring. Theoretically this may be true, but I do not wish to hav this statement misconstrued by your readers, because w know that it is practically impossible to obtain this percentage in actual pillar work.

I believe it bad policy for the mine operator to boas of his recovery of pillars or to exaggerate its percentag of the coal exploited, because there is always the possibility of such a statement being used against mine operator by lessors of coal properties, and it is my opinion that i 90 per cent. is secured as an ultimate recovery, it wil probably be the limit of what we may expect.

A. W. Hesse,
Assistant Chief Engineer,

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

Similar Airways—Two airways are similar to each other when their cross-sections are similar; the term "similar" has no reference to the length of the airway.

The cross-sections of airways are similar when their corresponding dimensions are proportional, each to each, and their perimeters parallel throughout or can be so placed.

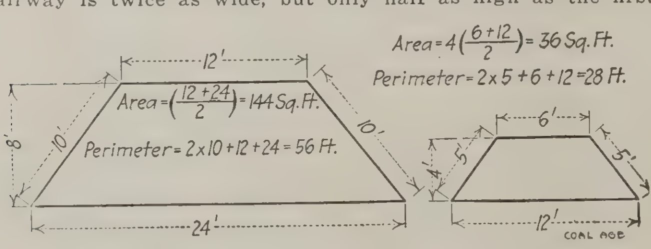
Illustration—All circular or square airways are similar, because they have but one dimension—the diameter of the circle or the side of the square, and these dimensions are, therefore, always proportional.

For example, one circular airway may have a diameter twice or three times as great as that of another circular airway; or the side of a square airway may be two or three times that of another square airway; and their perimeters can always be placed so that they will be parallel, each to each.

On the other hand, the rectangle, trapezoid and ellipse each have two dimensions; and while one of these dimensions may be two, three, etc., times as great as the corresponding dimension of another airway of the same form, it does not follow that the other dimensions of the two airways have the same proportion; and unless they do the airways are not similar. Thus, a 6x8-ft. airway and a 9x12-ft. airway are similar, because their corresponding sides have the same ratio, or are proportional and may be written

$$\frac{6}{9} = \frac{8}{12}; \qquad or\ 6:9::8:12$$

A 6x8-ft. airway and a 3x16-ft. airway, however, are not similar airways, though they have equal sectional areas ($6 \times 8 = 48$ sq.ft., and $3 \times 16 = 48$ sq.ft.); because the second airway is twice as wide, but only half as high as the first.



Area = 4 (6+12 / 2) = 36 Sq. Ft.
Perimeter = 2x5 + 6 + 12 = 28 Ft.
12'
Area = (12+24 / 2) = 144 Sq. Ft.
Perimeter = 2x10 + 12 + 24 = 56 Ft.

COAL AGE

An Example of Similar Trapezoids

It is important to observe that, in all similar airways, the ratio of the sectional areas of the airways is equal to the square of the ratio of the corresponding dimensions. For example, in the above figure showing similar trapezoidal sections ,the top, bottom and sides of the larger airway are each twice those of the smaller, and the area of the larger section is $2^2 = 4$ times that of the smaller.

The Coal Age Pocket Book

Principle of Similar Airways—Since corresponding dimensions of similar airways have a fixed ratio, which is the sam for each dimension (diameter, side, height or width) it i possible to compare similar airways with respect to any o these dimensions.

Application—Assume, for example, the same pressure (p is applied to each of two similar circular airways, and it i required to find how the quantity of air will vary in the tw airways. First write the formula for the quantity (q), i terms of the pressure (p) and the dimensions, area (a), perimeter (o) and length (l) of the airway, and the coefficien of friction (k):

$$q^2 = \frac{p\,a^3}{k\,l\,o}$$

Now, if the two airways have the same length p, l an k are all constant and

$$q^2 \textit{ varies as } \frac{a^3}{o}$$

But, the area of a circle varies as the square of its diameter (d^2) and the perimeter varies as the diameter (d); henc

$$\frac{a^3}{o} \textit{ varies as } \frac{d^6}{d} \textit{ or simply as } d^5$$

In the same manner, it can be shown, in respect to al similar airways of any form, that the square of the quantit varies as the fifth power of any corresponding dimension (d) whether diameter, side, height, or width;

$$q^2 \textit{ varies as } d^5$$

which gives the following:

Rule—In comparing similar airways of equal length, fo the same unit pressure, the square of the quantity ratio i equal to the fifth power of the dimension ratio; and, for th same power on the air, the cube of the quantity ratio is equa to the fifth power of the dimension ratio.

Example—If 100,000 cu.ft. of air is passing per minute, i a 6x9-ft. airway under a given pressure, what quantity of ai will the same pressure circulate in an airway 8x12-ft. of th same length? What quantity will the same power circulate

Solution—These airways are similar because their corresponding dimensions are proportional 6:8::9:12. Therefor calling the required quantity x,

$$\left(\frac{x}{100{,}000}\right)^2 = \left(\frac{8}{6}\right)^5 = \left(\frac{4}{3}\right)^5 = \frac{1024}{243} = 4.214$$

$$\frac{x}{100{,}000} = \sqrt{4.214} = 2.0528$$

$$x = 100{,}000 \times 2.0528 = 205{,}280 \textit{ cu.ft. per min.}$$

Assuming a constant power on the air:

$$\frac{x}{100{,}000} = \sqrt[3]{4.214} = 1.6152$$

$$x = 100{,}000 \times 1.6152 = 161{,}520 \textit{ cu.ft. per min.}$$

An Interesting Crossover Problem

Solution by A. F. Allard*

[In reply to the request of a correspondent who submitted the interesting problem in trackwork, Coal Age, Nov. 15, p. 745, a number of answers have been received. From this number, in accordance with our promise, we have selected and give below the simplest and most direct method of solution of the problem submitted.—Ed.]

The Problem

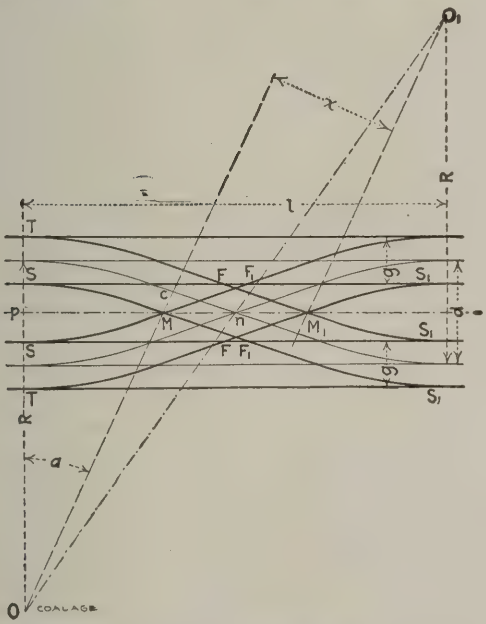
Given:

Entire length of crossover	l;
Distance between track centers	d;
Gage of track	g;
Radius of all curves	R;

all dimensions being expressed in feet.

It is required to find the following:

1. Length (x) of straight rail at center of crossover;
2. Angle (a) that subtends the curved track or rails.
3. Radius and length of outer curved rail.
4. Radius and length of inner curved rail.
5. Frog angles at F or F_1 and M or M_1.
6. Frog distance (SF or S_1F_1), measured on straight rail.
7. Length (TF) of lead (outer) rail.
8. Length (SM) of follower (inner) rail.



Plan of a Double Crossover Switch or "Diamond"

Solution—Referring to the accompanying figure:

(1) To find the length of straight track x:

$$oN^2 = On^2 - Oc^2$$

but

$$On^2 = Op^2 + pn^2$$

therefore,

$$cn^2 = Op^2 + pn^2 - Oc^2$$

But, $cn = x/2$; $Op = R - d/2$; $pn = l/2$; $Oc = R$; and substituting these values given in the last equation gives

$$\left(\frac{x}{2}\right)^2 = \left(R - \frac{d}{2}\right)^2 + \left(\frac{l}{2}\right)^2 - R^2$$

$$x = \sqrt{l^2 + d^2 - 4Rd}$$

which is the required length of straight rail at the center of the crossover.

(2) To find the angle (a) subtending the curve:

$$SOM = SOn - cOn;$$

but,

$$\tan SOn = \frac{l}{2R - d}$$

and

$$\tan cOn = \frac{x}{2R}$$

From these three formulas, the angle SOM or a is readily calculated.

(3) The radius of the outer curved rail of each switch is $R + g/2$. This curve is subtended by the angle a; and its length calculated by the formula

$$\frac{a}{180}\pi\left(R + \frac{g}{2}\right)$$

(4) The radius of the inner curved rail of each switch is $R - g/2$; and the length of this curve is calculated by the formula

$$\frac{a}{180}\pi\left(R - \frac{g}{2}\right)$$

(5) The frog angle at F and F_1 is equal to the angle SOM or a; because SO and OM are, respectively, perpendicular to the straight rails of the crossover and those of the main track.

The frog angle at M and M_1 is exactly twice the frog angle F or F_1.

[This is true when $(2R - g)(1 - \cos a)$ is equal to or less than $d - g$; but if greater than $d - g$, this frog will fall on the curve, in which case the frog angle at M will be twice the angle, whose cosine is $\frac{2R - d}{2R - g}$.—Ed.]

(6) The frog distance SF or S_1F_1 is calculated by the formula

$$SF = \left(R + \frac{g}{2}\right)\tan\tfrac{1}{2}a + \frac{g}{\tan a}$$

(7) The length of the lead rail (TF) is calculated by the formula

$$TF = \left(R + \frac{g}{2}\right)\left(\frac{a}{180}\pi - \tan\frac{a}{2}\right) + \frac{g}{\sin a}$$

(8) The length of the follower rail (SM) is calculated by the formula

$$SM = \left(R - \frac{g}{2}\right)\left(\frac{a}{180}\pi - \tan\frac{a}{2}\right) + \frac{d - g}{2\sin a}$$

[A number of good solutions to this problem were received from correspondents. The solution of Donald M. Liddell, New York, ranks second.—Ed.]

---

*Chief engineer, Bunsen Coal Co., Danville, Ill.

EXAMINATION QUESTIONS

Miscellaneous Questions

(Answered by Request)

Ques.—What are the different methods used in mining coal on moderate pitches and steep pitches, respectively?

Ans.—With the use of wooden rails in the rooms, cars may be taken to the face and loaded cars safely handled by hand on inclinations up to about 5 deg.; or, say 3 in. per yd., provided the cars are properly spragged and do not weigh to exceed 1 ton when loaded. By driving the rooms across the pitch, or at an angle not less than 30 deg. with the gangway, under the same conditions, it is possible to handle the cars with safety, from the face to the gangway, on any inclination up to 10 deg.

When rooms are driven on the full pitch of the seam, cars are often raised and lowered between the working face and the gangway, on inclinations varying from 5 to 10 deg. Self-acting inclines are used on inclinations varying from 5 to 15 deg.; and, by the use of a "barney," the same gravity system is used on inclinations varying from 10 to 30 deg. In the use of these systems, the weight of the loaded car should not exceed 3000 lb.

In what is called the "buggy system," which is only adapted to thick seams, the coal is transported from the face to the gangway in stages, by low cars or trucks, the coal being dumped into another car at the end of each stage until the gangway is reached, where it is loaded into the regular mine car. This system is used on pitches varying from 10 to 18 deg.

"Chute mining" is used quite generally on inclinations from 15 deg. upward. The chutes must often be lined with sheet iron, until the inclination of the chute exceeds 30 deg., when the coal slides on the natural floor of the seam. In very steep pitches, the "battery system" is used where the chute is kept full of broken coal, which is drawn only as the face of the breast progresses upward, the miner standing on the broken coal at the face while performing his work.

Ques.—Which would require the use of the largest pillars and why, hard bottom and soft top, or soft botton and hard top?

Ans.—The width of room pillars depends chiefly on the depth of cover or roof pressure, the hardness of the coal and thickness of the seam, the width of pillar then bearing a certain relation to the width of the opening.

A hard bottom and soft top require narrow openings in order to safely support the weak roof; and, as a result, the required width of pillar is reduced in proportion, for the same conditions of seam and overburden. With a soft bottom and hard top, the conditions are quite different. The rooms or openings can be driven wider, which increases the width of the pillar proportionately; but the width of the pillar is still further increased by the difficulty of breaking the top, so that the roof will fall and relieve the pressure on the pillars.

Therefore, in answer to the question, it may be said that, in general, the widest pillars are required when the bottom is soft and the top hard. The wide pillar, in this case, distributes the roof pressure over a greater area and avoids the tendency of the bottom to heave. The size of the pillar is also increased by the inclination of the seam.

Ques.—What precautions would you use in driving toward old workings of unknown location?

Ans.—When driving toward old abandoned workings, a single prospect heading, not exceeding 8 ft. in width, should be driven in advance of the other workings. A drill hole should be kept 5 or 6 yd. in advance of the face of the heading, and flank holes should be drilled at an angle of about 45 deg. with the entry, every 8 or 10 yd. of advance. Wooden plugs should be kept in readiness for use in case a drill hole taps water. A sharp lookout should be kept for any increase of water or gas at the face of the heading. Only safety lamps should be used in the work.

Ques.—How would you drive a slope on a uniform grade, without an engineer's level?

Ans.—A long straight-edge should be used to lay on the floor of the entry, or on the rails, and on the top of this should be arranged a template cut to the required angle of the slope; so that when the straight-edge lies on the floor of the slope the top of the template will be level. A common handlevel is then used on the top of the template to indicate when the slope has the proper grade or inclination.

Ques.—At what point in the mine should the "intake" air current be considered the "return"?

Ans.—In general, the air current is called the return current, the moment it enters the return airway. In some cases, it is difficult to determine with exactness this point of difference. What is the *return* current of one section of the mine may become the *intake* current of another section.

The most approved plan of circulation in a well developed mine makes the return air of each section enter the main-return airway, at once. This system, however, requires the erection of an overcast or air bridge at the mouth of each section. But, until the development of a pair of entries is sufficient to warrant the expense of the erection of an air bridge, the circulation is made continuous through that pair of entries and the main headings inby from that point.

Speaking, therefore, in reference to a single pair of entries, it is correct to speak of the "intake" and "return" currents passing through them. But, with respect to the entire mine, the current is all an "intake current" until the farthest point inby is reached, which is generally the last crosscut on the main heading. From this point outby, the current is properly termed the "return current," with respect to the entire circulation, although this same current may be made to traverse another pair of headings, in which the circulation may be referred to as "intake" and "return," for that particular section or pair of headings. The main intake and return airways are the main airways outby from the last air bridge nearest the face of the main heading.

COAL AND COKE NEWS

Washington, D. C.

Coal-mining interests are organizing for the purpose of opposing the advance in rates on railroads, which is now being urged upon the Interstate Commerce Commission. Their hostility to the scheme has been manifest for some time past but is now coming to a head in the bituminous trade.

The Pittsburgh Coal Co. is prominent in leading the opposition to the advance in rates and has already engaged expert counsel. The view apparently taken by the coal people is that they constitute an exception to the general rate situation in that rates are already too high on their product, so that they should not be advanced in any event.

In a general way they are preparing to argue that even if it should be found that the railroads are in some cases suffering for lack of higher rates, it would be of no particular use to grant them because the organizations of railroad employees which have shown their power so strongly within recent months would at once take the increased income away from them. The result would be that the roads would then be left, it is claimed, in precisely as difficult a position as they are today while the shippers and the public would be obliged to struggle along under the burden of higher rates resulting from the adoption of the advance as requested.

On the other hand it is openly suggested that if the rate advance is actually granted, coal producers who are now doing business upon an exceedingly narrow margin of profit will immediately resort to the courts for relief. It is pointed out that in so doing they would be able to urge that the advanced rates were practically confiscatory, because as has been shown in the past operations are on so close a margin of profit.

This point was elaborately brought out at hearings before the commission in 1912, when the bituminous companies in the Ohio region protested strongly against the proposed advances which the railroads were endeavoring to force upon them at that time. It is doubtful whether an effort to get an injunction from the courts, should higher rates be allowed, would prove successful, inasmuch as the present hearings before the commission are merely in the nature of an investigation and do not deal with any specific schedules of advance rates.

The commission, when the rate question came up in an acute form, had the schedules withdrawn and then announced that it intended to institute a proceeding on its own account, into the general justice of the proposed rate advance. The present investigation was the result of the promise thus given.

If it should turn out in favor of the roads, what would happen would be simply that the commission would practically express a willingness to see advance rate schedules filed. Then presumably the advance would be filed and shippers would have to go through the form of filing a complaint which the commission would presumably set aside. Appeal could be taken to the courts, and an injunction asked for, but it is doubtful whether such an injunction would be made permanent in any case, in view of the previously favorable finding of the Interstate Commerce Commission.

Prolonged litigation would then have to be carried on by the coal companies and others similarly situated if they wished to prevent the advances from being put into ultimate effect, and meanwhile the higher rates would continue to be charged as permitted by the commission. According to counsel for the coal companies, their argument will be largely directed toward inducing the commission to make, in its final opinion, a distinct exception in favor of the coal producers, should that opinion actually favor higher rates, on commodities in general.

PENNSYLVANIA

Anthracite

Shamokin—The recent discovery of two veins of coal by workmen digging a foundation for a new public-school building, suggested a novel idea to Supt. Howerth, of the public schools. He proposes to leave a large portion of the measures exposed and cement the cellar. Expert mining men will be asked to timber the seam and make miniature breasts, headings and gangways to show how coal is taken from the earth. The exhibit would be used as a practical demonstration of mining methods for students and a showplace for the public, which, owing to a recent order of coal companies, is not permitted to visit underground workings. One of the veins is 10 ft. and the other 4 ft. thick.

Tamaqua—Ernest Fink and C. A. Milloux, of New York, who, for the past year or more, have been prospecting for coal in the Owl Creek Valley, have abandoned the project and shipped their machinery away. The company recently became incorporated under the name of the Eastern Pennsylvania Coal Co., and bought the Phillips operation, near Middleport, which is now working.

Plymouth—Two strikes within a week is the record established at the Lance Colliery of the Lehigh & Wilkes-Barre Coal Co., at Plymouth. The men went out at first on account of a difference existing between the check docking boss, John Bodgen, and the company. Later they returned to work with the understanding that the grievance would be settled. When the company failed to reinstate the check docking boss, the men were again ordered to remain away from work.

Wilkes-Barre—An interesting departure from the usual custom in making up the program for mining institute meetings was that of the last meeting of the Wilkes-Barre District Mining Institute, in which Jacob Urban, a Polish miner employed by the Lehigh Valley Coal Co., gave an illustrated lecture in Polish, on the accidents common to coal mining and the ways in which they could be prevented, using the photographs made by the Lackawanna Coal Co. for the instruction of its employees. Officials of the Wilkes-Barre Institute hope in this way to reach others than the mine foremen and assistants, for whom most of the previous programs have been arranged.

Bituminous

Canonsburg—Work in a number of the coal mines in the Chartiers Valley is becoming quite slack. At Westland, the mines have been shut down since prior to Thanksgiving, while others in the vicinity are operating only a part of the time. Some miners are leaving for their former homes across the Atlantic.

Evans City—The Evans City Coal Co. is lifting the options it holds on about 6000 acres of coal lands along the Harmony trolley line, mostly in Butler County. The Evans people will shortly open their first mine. Deeds for the purchase of the tract are being prepared and a deal is under way for the taking of additional coal land in Forward Township, Allegheny County, the intention being to option and later buy several thousand acres.

Pittsburgh—On a petition presented by the Pittsburgh Provision & Packing Co., asking for the appointment of a receiver for the White Rock Supply Co., Judge J. B. McFarlane appointed F. R. Babcock, J. W. Ailes and John H. Jones. These are the same receivers recently appointed for the Pittsburgh-Buffalo Co. The White Rock Supply Co. is the general supply store connected with the coal company interests.

WEST VIRGINIA

Wheeling—A rumor has been circulated to the effect that a deal for large coal holdings has been closed, whereby the Lorain Coal & Dock Co. has purchased the West Wheeling mine holdings. The latter lie across the river in Ohio. Just what the consideration was is not known, but it is said to be large.

Huntington—It is stated here by those interested in the recent negotiations between an English syndicate and a number of coal operators for the purchase of coal land in the New River field, that this deal has fallen through, at least for the time being. It was thought when the negotiations first started with the English syndicate that one of the largest coal deals that had ever been made in West Virginia would be consummated and practically all contracts had been drawn up for that purpose. The foreign financiers, however, insisted on six months, while the local operators stood together on a 10- to 30-day limit to options, with the result that the deal was not consummated nor does it seem probable that it will be unless better terms can be secured in the spring.

TENNESSEE

La Follette—Employees at the Rex No. 1 coal mine of the

La Follette Coal, Iron & Ry. Co. have been on strike since Dec. 2, and at Rex No. 2 mine since Dec. 4, on account of the discharge of a gasoline locomotive repair man, for not following instructions. A few of the men are still at work at each place, the number increasing each day. It is expected that all the men will be back to work in a very few days.

KENTUCKY

Louisville—The complaint of the Drury Coal Co. against the Illinois Central R.R. Co., filed with the Interstate Commerce Commission, will be heard by a special examiner in Louisville on Feb. 2.

Henderson—After six months' work, the Spottsville mine of the Pittsburgh Coal Co., has been pumped out, and will shortly be in good shape for work. The mine is said to reach one of the finest beds of coal in the western part of Kentucky, and its product is in good demand.

Sturgis—The West Kentucky Coal Co. broke all records in the western Kentucky field when it got out 4980 tons in one day last week. The company is now employing 1100 men, all of whom are working regularly. This is the largest force ever employed by any company in that part of the state.

OHIO

Martins Ferry—Deeds have been filed at St. Clairsville transferring several parcels of coal land in Washington and Smith townships to the Glens Run Coal Co. for a total consideration of $15,433.15. The sale of this coal is believed to be connected with that sold by the receivers of the J. W. Gorrell Coal Co. to the Glens Run Co. some time ago at a much larger price.

INDIANA

Boonville—Efforts of organizers to unionize the coal-stripping field have been answered by the Sunlight Coal Co. by the discharge of thirty employees who had signed to join the union.

Evansville—Henry F. Allen, of Pittsburgh, representing capitalists of that city who have made arrangements to merge fifteen to twenty of the largest coal mines in western Kentucky, have leased the building now occupied by the First National Bank, to be used as offices for the new company. The capitalists believe western Kentucky will become one of the largest coal fields in the Middle West, with the completion of the Panama Canal and the building of locks and dams along the lower Ohio River.

ILLINOIS

Herrin—With about a 70% car supply, mine No. 8 of the Big Muddy Coal & Iron Co. hoisted approximately 70,000 tons of coal last month, which is a record breaker, all things considered.

Edwardsville—The De Camp Coal Mining Co., of De Camp, Ill., has gone into the hands of a receiver, C. W. Huskinson, of Alton, Ill., an old mining man, having been appointed to take charge of the property. The application was filed by the State and Trust Bank of Highland, Ill., as trustee for the bondholders. The De Camp company is one of the oldest in this field, and at one time was one of the largest wholesale and retail companies in St. Louis.

Hillsboro—The 300 miners employed in the Kortcamp mine here, who have been on strike for five weeks, reported for work a few days ago. After settling their troubles they found to their surprise that they were not regular union miners and could not go to work, inasmuch as the state officers of the Mine Workers had revoked their charter. The cause of the walk-out was that a man was given a job of unloading before his turn. The miners demanded his discharge and would not abide by the ruling of the pit committee. The state officials backed up the pit committee and a new charter will have to be taken out. In the meantime the mine continues idle.

East St. Louis—The railroads entering St. Louis are commencing to store coal in anticipation of labor troubles next spring. The Illinois Traction System is figuring on filling a large concrete reservoir at Riverton, Ill., with 30,000 tons, and storage yards are contemplated at other points. The Illinois Central is laying tracks at Marine, where it will, it is understood, store 50,000 tons. The Illinois Southern is storing at points along its line about 10,000 tons. All other roads are buying in small quantities, so as not to disturb the low market price.

Springfield—The coal-carrying roads of Illinois are suffering on account of the mild weather of the present winter. Coal ordinarily constitutes a considerable portion of their traffic, and with the decreased demand for fuel, the earnings suffer in proportion. On the Wabash R.R. the Decatur Division loaded 5469 cars in November, 1912, as against 4746 this year. All other roads are loading in similar quantities.

COLORADO

Lafayette—An explosion occurred Dec. 16 at the Vulcan mine of the Rocky Mountain Fuel Co., at Lafayette, Boulder County, Colo., about 18 miles in a direct line approximately north-northwest of Denver. It is said that 38 men were killed, all of whom were married, and all but eight Americans. The mine was only a year old and according to reports, it was well equipped. It is located on the Colorado & Southern R.R.

The coal is sub-bituminous. An analysis of a nearby coal showed moisture 19.15 per cent, volatile matter 30.82, fixed carbon 44.27, sulphur 0.25 and ash 5.51. On air drying the loss is 13.4 per cent.

It appears that the mine caught fire after the explosion, making recovery difficult.

FOREIGN NEWS

Rydnik, Prussia—Sixteen miners were recently killed here by smoke from a fire which started suddenly in a mine. The fire was extinguished, but not until this number of men had been overcome.

Montreal, Canada—It is understood that arrangements for financing the Canadian Coal & Coke Co. have made satisfactory progress. Interim certificates of two-year 6 per cent. notes are now being sent out and will be replaced shortly by the definite certificates. The arrangements are said to concern the sale of an issue of $2,000,000 to $3,000,000 first-mortgage bonds, which will ultimately retire the short-time notes and bank loans and provide additional funds for the use of the company.

PERSONALS

M. T. Davis, president of the Cabin Creek Consolidated Coal Co., has disposed of his interest in that firm and has retired from the presidency. William Puckett, one of the largest stockholders, has been elected president. The company has an authorized capital of $1,500,000, of which $1,200,000 has been paid.

G. P. Troutman, of West Pittston, assistant division superintendent and division engineer of the Lackawanna Division of the Lehigh Valley Coal Co., has tendered his resignation, to take effect on Dec. 24, to accept the position of Assistant General Manager for Markle & Co., at Jeddo, the largest individual operators in the anthracite region.

J. C. Davies, state mine inspector of Ohio, has appointed the following district deputies. Dennis H. Sullivan, Coshocton, secretary of the State Board of Arbitration, deputy in the sixth district; Morris Albaugh, Murray City, deputy in the second district; Andrew Ginan, of Jacksonville, deputy in the third district, and Evan Lewis, of Harmon, deputy in the seventh district.

E. S. Rolapp, G. W. Cushing, J. A. Reeves, Henry Conlan, Jr., J. F. Emmert, D. D. MacLean, F. J. O'Brien and William Gorton, coal-mine operators of Utah and Wyoming, were in Portland recently and discussed with Traffic Manager R. B. Miller, of the O.-W. R. & N. company, the possibility of getting reduced rates on coal freights from their mines into the Pacific Northwest. The mining men contend that the rates now charged prevent them from entering this territory in competition with mines on other roads having more favorable rates.

Steam Superheater—A. Bolton, Manchester, Eng., 1,073,-44, Sept. 23, 1913. Filed March 19, 1913. Serial No. 755,-40.

Apparatus for Pulverizing Coal—C. A. Bettington, London, Eng., 107,040, Sept. 23, 1913. Filed Nov. 15, 1909. Serial No. 28,150.

Fuel Economizing Apparatus—E. F. Clarke, Birmingham, Eng., 1,073,795, Sept. 23, 1913. Filed Feb. 24, 1913, Serial No. 50,306.

Gas Producer—C. H. T. Alston and P. T. Houston, London, Eng., 1,074,032, Sept. 23, 1913. Filed June 28, 1913, Serial No. 76,415.

Furnace for Steam Generators. J. Ramacher, Cologne, Germany. 1,077,203. Oct. 28, 1913. Filed Apr. 29, 1912. Serial No. 693,852.

Improvements in Apparatus for Washing Coal and the Like. Clifton & Kersley Coal Co., Ltd., Clifton, Manchester, England. 12,913 of 1913.

Improvements in and Connected with Coal and Other Mine Conveying Machinery. E. Douglas, Bispham Hall, near Wigan, England. 24,256 of 1912.

Gas Producer. J. K. Lyons, Pittsburgh, Penn., and J. B. Hardee, Crafton, Penn. 1,075,716. Oct. 14, 1913. Filed Jan. 2, 1909. Serial No. 470,486.

Improvements in or Relating to Apparatus for Making Coke and Gas. H. Neilson, 117 Julienstrasse, Essen-Ruttenscheid, Germany, 14,376 of 1912.

Method of Removing Impurities form Coal Gas—G. H. Hultman Stockholm, Sweden, 1,073,605, Sept. 23, 1913. Filed June 3, 1913, Serial No. 771,411.

Rectangular Gas Producer—R. B. Mildon assignor to Colonial Trust Co., Pittsburgh, Penn., 1,073,919, Sept. 23, 1013. Filed Apr. 9, 1910, Serial No. 554,541.

Improved Device for Preventing Accidents in Coal and Other Mines due to Overwinding. W. Wilson, Bathville Cottage, Armadale, Scotland. 1655 of 1913.

Improvements in Explosives for use in Coal Mining and the Like. G. Carew, and British Wesefalite, Ltd., all of Powder Factory, Denaly, near Rotherham, England. 8530 of 1913.

Steamship Furnace. C. A. Kuenzel, assignor to Kuenzel Gas Producer & Smelter Construction Co., a corporation of Washington. 1,076,893. Oct. 28, 1913. Filed Aug. 17, 1912. Serial No. 715,576.

Improvements in or Connected with Stamping Machinery for Compressing Various Materials, and More Especially Coal for Coke Making and the Like. J. J. H. Mackinlay, of Wroctwardine House, Salop, and Wm. Krueger, 61 Southfield Rd., Middleboro, England. 21,423 of 1912.

CONSTRUCTION NEWS

Wilkes-Barre, Penn.—The foundation walls for the breaker to be built by the Lehigh Valley Co., at the Packer No. 5 operation at Girardville, has been completed.

Kittanning, Penn.—The Wallworth Coal Co. recently took out papers to establish a town, to be known as Wallworth, on the opposite side of the Allegheny River from Kittanning. The company will open mines there.

Sandusky, Ohio—The first crib has been sunk for the construction of the $1,000,000 coal docks of the Lower Lakes Dock Co. in West Sandusky. This will support the loading machine to be installed when the dock is completed.

Ellwood City, Penn.—The National Coal Co., of this place, backed mostly by local capital, will begin the construction of one of the largest and most substantial coal elevators in this section along the tracks of the Baltimore & Ohio Railway.

Huntington, W. Va.—A railroad line, which will extend from the Kentucky coal fields to Baltimore, and which will shorten the haul of 200 miles, is being projected by a party of capitalists, among whom is John T. McGraw, of Grafton, W. Va.

Martins Ferry, Ohio—Work has commenced on the improvement of the Webb mine of the Pennsylvania R.R. Co. and will continue for several months. The company is moving the tracks and changing the channel of Wegee Creek in order to increase the output of the mine.

Fleming, Ky.—The Mineral Fuel Co. has started the building of another industrial city on Yount's Fork, two and a half miles from Fleming, where a large coal development is soon to be started. The name of the new city has not yet been agreed upon, but a number of mines will be opened there.

Jenkins, Ky.—Rush work characterizes the construction of the power line from the mammoth power plant of the Consolidation Coal Co. here to the big operations of the Elkhorn Coal Corporation on Beaver Creek, also the Elkhorn Coal & Gas Co. now doing large development work in the Beaver Creek coal fields.

Craftsville, Ky.—There are plans developing here for the early construction of a branch of the Lexington & Eastern R.R. from Craftsville to the headwaters of Millstone Creek, four miles, to reach extensive timber and coal lands of the Mineral Development Co., who are billed to begin immediate development work.

Wayland, Ky.—Eighteen miles of the 24 of the Beaver Creek Branch of the Chesapeake & Ohio R.R., from the mouth of Beaver Creek to reach the coal operations of the Elkhorn Coal Corporation and the Milwaukee Coal & Gas Co. have been completed and double time is being made on the laying of the steel on the remaining six miles.

Fleming, Ky.—S. T. Mundy, of the Mundy Construction Co., Hazard, Ky., has been awarded the contract for the construction of the two and a half-mile branch of the Yount's Fork Creek extension of the Lexington & Eastern R.R., from Neon to the new coal operation now being started by the Mineral Fuel Co. The construction of the new branch is to be started immediately.

Blackey, Ky.—Contract for the construction of the Rockhouse branch of the Lexington & Eastern R.R. from Blackey into the headwaters of Rockhouse Creek 18 miles to reach the rich coal lands of the Rockhouse Coal Co., the Slemp Coal Co. and the Litts Coal Co. has been awarded Adams & Sullivan, of Louisville. It is expected that the construction will be fully begun by Jan. 1.

Whitesburg, Ky.—Work of opening the Mineral Fuel Co.'s several mines at Haymond, on Pottersfork, is being rushed with all possible haste, while a large number of miners' homes are going up rapidly. Indications now are that the new city is going to meet a most phenominal growth. It will be reached by a three-mile branch of the Lexington & Eastern work upon which is now being rushed by Farbrick & Baxter, contractors.

Wayland, Ky.—The Ballard & Herring Co. has been awarded a contract to build two miles of railroad line up Stone Coal Creek from here to reach rich and extensive coal holdings of the Elkhorn Coal & Gas Co., who will begin at once the development of their holdings. The building of another industrial mining city is to start at once. This is two miles from Wayland. The branch railroad is from the Beaver Creek branch of the Chesapeake & Ohio R.R.

Birmingham, Ala.—The Republic Iron & Steel Co. announces the following improvements which will be started at once: The complete dismantling of No. 1 furnace at Thomas, Ala., and its reconstruction, at a cost of approximately $75,000, the almost total reconstruction of the properties at Palos including the construction of a modern tipple, washer, etc. In all probability, also, a battery of byproduct coke ovens will be built at the Thomas plant, but while this has not definitely been decided, the other improvements mentioned have been authorized.

NEW INCORPORATIONS

Covington, Ky.—The Carlisle Coal & Land Co. has been incorporated by Richard P. Ernst, George Stugard and John E. Shepherd, with a capital stock of $5000.

Clinton, Ind.—The Essanbee Mines Co., of this city, has increased the number of its directors from four to five, and has changed its place of business to Terre Haute.

Columbus, Ohio—The Hamilton-Parker Fuel Co., of Columbus, Ohio, has filed papers with the secretary of state increasing its capital stock from $30,300 to $50,300.

Pittsburgh, Penn.—The Youghiogheny-Pittsburgh Coal Co. has filed notice of an increase from $695,000 to $700,000 in its capital stock, and the creation of a debt of $900,000.

Louisville, Ky.—The East Kentucky Mining Co. has been organized in Louisville by Ben Leahy, Allen McNally, J. H. Bickel, Jr., J. W. Barker and W. H. Soper. The capital stock of the company is $20,000, and its debt limit $30,000.

Louisville, Ky.—The Virginia Coal Co., with a capital stock of $10,000, was recently organized by C. N. Boone, F. A. Hildebrand and L. J. Bergenroth. The company proposes to acquire coal lands in the eastern Kentucky field and will probably open an operation.

Charleston, W. Va.—An application has been filed with the Secretary of State for changing the charter of the Cabin Creek Consolidated Coal Co. This application, which affects a company with a paid-in capital of $1,200,000, has been granted, and the charter modified.

Indianapolis, Ind.—The Chicago-Carlisle Coal Co., of Carlisle, has been organized with a capital stock of $100,000. The purpose of the new incorporation is to own and operate coal mines. The directors are George A. Van Dyke, Webster A. Patterson, and Robert J. Frank, all of Chicago.

INDUSTRIAL NEWS

Wilkes-Barre, Penn.—The Lehigh & Wilkes-Barre Coal Co. will add to the equipment of its mines soon three 8-ton and two 10-ton General Electric mining locomotives.

Connellsville, Penn.—The Indiana County Coal Co., of Indiana, Penn., has sold to the Tide Coal Co., 327 acres of coal in Center Township, Indiana County, for a consideration of $18,320.

Birmingham, Ala.—The Gold Creek Coal Co. recently filed a petition in voluntary bankruptcy. The assets of the company are named at $35,000, while the liabilities are said to amount to $22,500.

Pottsville, Penn.—The Philadelphia & Reading Coal & Iron Co. will shortly install another 4-ton electric storage battery mining locomotive recently ordered from the General Electric Co., in its Glendower colliery.

Piedmont, W. Va.—The Abrams Creek Coal & Coke Co. will shortly place in operation in its mines the 3.5-ton 42-in. gage General Electric Co. storage battery mining locomotive and charging panel recetly ordered.

Whitesburg, Ky.—The Litts Coal Co., with headquarters at Coeburn, Va., is making arrangements for the development of a 5000-acre coal tract on Carr's Fork. Several million dollars will be expended in the development work.

Duluth, Minn.—The Berwind Fuel Co. will soon add to the electric equipment of its plant at Duluth Dock four 750-kv.-a. water-cooled transformers, switchboard and accessories. This apparatus will be furnished by the General Electric Co.

New Orleans, La.—Much of the coal lost in the wreck at Island No. 30 will be saved. Steam shovels are being used to take the coal out of the shallow water, where the barges went on the sand bar. The barges themselves will be a total loss.

Connellsville, Penn.—John D. McBride and wife have deeded to W. McK. Reed, of Pittsburgh, 157 acres of coal in the River seam of Pittsburgh coal, lying in North Strabane Township, Washington County, Penn., for a consideration of $64,646.

Ironton, Ohio—The operating offices of the Hess Dustless Mining Machine Co. have been removed from Amstead, W. Va., to Ironton. The machines have been made by the Ironton Engine Co. for the past 8 months. They are electrically driven and are said to be dustless.

Cleveland, Ohio—Captain Richardson, a Cleveland ship owner, has placed an order with the American Ship Building Co. for a 9000-ton steel freighter to replace the steamer "Howard M. Hanna, Jr.," wrecked in the recent storm. The boat is to be completed by the spring of 1914.

Washington, D. C.—The United States Government will prosecute labor leaders connected with the Western Federation of Miners accused of violating the Sherman anti-trust act in their activities. The stand has been taken that there is nothing in the sundry civil bill which prohibits such prosecution.

Philadelphia, Penn.—The Nelson Valve Co., of Chestnut Hill, Philadelphia, announces that it has recently taken over the manufacture and sale of the Erwood swing gate valve, formerly made by Messrs. Walch & Wyeth, of Chicago. In the future these valves will be known as the Nelson-Erwood swing gate valves.

Washington, Penn.—Daniel M. Thompson, of Deer Lick, Green County, has sold his undivided interest in a tract of land near Deer Lick to J. S. Patterson, of Waynesburg, for $260 per acre. J. G. Loughman, who for several years held an interest in the same tract of land, has also disposed of his interest to Mr. Patterson at the same price.

Birmingham, Ala.—The Little River Mining Co. has been incorporated at Gadsden, Ala., and proposes to develop about 7500 acres of coal land in the northern part of the state. The capital stock is placed at $4000, and the officers are W. T. Underwood, president; C. F. Manley, vice-president and treasurer, and Hugh White, secretary, all of Birmingham.

Cleveland, Ohio—The operation of a municipal mine may be undertaken by this city in an effort to reduce fuel bills now paid for city, county and school institutions. The city council gave this proposition serious consideration when it requested the bureau of information and complaints to compile figures showing the amount expended annually for fuel.

Columbus, Ohio—Coal operators in eastern Ohio and Pomeroy Bend districts are much interested in the recommendation of the United States Army Engineers, for a $9,000,000 appropriation for the improvement of the Ohio River. In case the appropriation is included in the Rivers and Harbors Bill it will mean a continuation of the past policy to furnish a stage of 9 ft. at all times in the Ohio River.

Birmingham, Ala.—The Sloss Sheffield Steel & Iron Co. announces that the battery of bee-hive coke ovens at its City Furnace, in the heart of Birmingham would be dismantled on the first of the year. These ovens were built in 1881, and have been in continual service since then, but recently the Sloss company agreed to remove the ovens in order to abate the smoke nuisance. It will be the passing of an old land mark.

Thomas, W. Va.—The Davis Coal & Coke Co. will shortly install additional electrical equipment in its power station consisting of two 300-kw. rotary converters; three 50-kv.a., three 75-kv.-a., six 110-kv.-a. and three 400 kv.-a. transformers, and switchboard apparatus. The additions to the mining equipment include three 6-ton and two 10-ton electric mining locomotives. All this apparatus will be supplied by the General Electric Co.

Birmingham, Ala.—The Alabama Railroad Commission recently issued an order reducing the rate on coal between Birmingham and Selma, from $1 per ton to 80c. per ton. The fight for a lower rate has been a lengthy one, and the first order issued by the commission was against the city of Selma. The latter, however, secured a second hearing, and the petition was granted. It is believed that the reduction in coal rates will prove of great benefit to the Selma manufacturing interests.

Indio, Ala.—The De Soto Coal Mining & Developing Co. has been placed in bankruptcy, the petitioners claiming that the company owes over $30,000 in debts. R. A. Porter, a Birmingham wholesale grocer, and A. J. Reilly, of Inland, Ala., a coal operator, have been named as referees. It was reported several weeks ago that this property had been sold to R. C. Middleton, of Birmingham, but the bankruptcy papers were against the De Soto company, of which B. C. Stevens, of St. Louis, is president.

Mobile, Ala.—O. F. Files, manager of the Alabama & New Orleans Transportation Co., has announced that the report recently published to the effect that the barge line operating on the Warrior River, would not supply coal from the Warrior district to Mobile, was in error, and that the company would supply Mobile, as well as New Orleans. This will give Mobile the benefits of the water rate from Birmingham. Barges are now being operated on regular schedule from Tuscaloosa to Mobile and New Orleans.

Columbus, Ohio—The joint legislative committee named to investigate the feasibility of the Ohio canal system has reported to Governor Cox. The committee takes a middle course and does not recommend the operation of the canals at present, but on the other hand does not favor the selling of the lands at this time. The report recommends enlisting the aid of the Federal Government in an attempt to establish cross-state water-way systems between the Ohio River and the Great Lakes. The committee deplores the policy followed in the past of selling canal lands piece-meal.

Birmingham, Ala.—Of paramount interest to the coal operators of the Birmingham district is the contract of the New Orleans Ry. & Light Co., calling for approximately 170,000 tons of steam coal and 25,000 tons of coke yearly. While this contract is not an especially desirable one, due to the fact that it calls for penalties on moisture, ash, sulphur, and heat content, and does not provide a bonus for superior coal, yet with the market in its present quiet condition practically all of the large operators have sent their representatives to New Orleans to make their bids upon this contract.

COAL TRADE REVIEWS

GENERAL REVIEW

Anthracite dull. Pressure on stove coal has swung to chestnut. Bituminous developing a strong undertone, while superficially dull. Prices moderately firm in spite of pessimistic reports at all points. Situation hinging on weather conditions.

While the recent cold snap had a stimulating effect upon the retail end of the hard-coal business, the low temperatures were not of sufficient duration to affect the wholesale market, and the trade has again relapsed into a waiting attitude. The market is dull and operators are depending entirely on business already placed. Contract renewals are attracting some interest and indications point to an increase over last year's quotations. An interesting development in the anthracite trade has been the reduced pressure for stove coal; producers apparently conserved their supplies of this grade too rigidly, when indications pointed to an acute shortage, with the result that much of this natural consumption has been covered by chestnut and this is now in the shortest supply.

While keen disappointment is being expressed on every hand at the dull situation in bituminous, close observers of conditions are inclining to the belief that the position of the market is highly favorable, considering the adverse weather and curtailment in general industrial manufacturing. Inquiries for large tonnages will usually develop a high price, indicating that the dullness is confined more particularly to the smaller concerns and is therefore of a more or less superficial character. On the other hand it is obvious that business is not nearly so active as might really be expected at this time. There is a more abundant supply of coal while some of the larger consumers are cutting down on their contracts and an occasional instance of forced selling is reported where the market has been overshipped.

A stiffening tendency is noticeable in the Pittsburgh market, due to increased domestic business, as the result of the colder weather; however, manufacturing is light and there has been considerable falling off in consumption, with the end not yet in sight. The recent cold weather checked the rapidly declining market in Ohio and temporarily prevented what promised to develope into a complete demoralization. Considerable difficulty is being experienced in the northern part of the state due to a severe congestion on the railroads. Unsteadiness is the rule, some companies showing a tendency to cut the circular in order to force business. There is still some surplus coal on hand at Hampton Roads, but prices are being firmly maintained and indications are that this excess tonnage will soon be moved. Domestic business in the South picked up sharply as a result of the freezing temperatures.

Notwithstanding the dull situation, prices in the Middle West are being held remarkably firm. Some cutting, on the part of small operators, in order to stimulate business, is noted, while prices generally are being hammered severely. Curtailment in iron and steel manufacturing plants is having an adverse effect on the steel market, while the weather is not cold enough to bring the domestic consumption up to normal.

EASTERN MARKET

BOSTON, MASS.

Bituminous market generally listless. Spot inquiry somewhat improved, and a slight increase in offshore and government requirements. Contract demand still inactive particularly for New River and Pocahontas. Anthracite softer, due chiefly to continued warm weather with a lack of stove coal still noticeable.

Bituminous—There is but little change in the market over that of last week. At Hampton Roads there is considerable coal standing, Newport News and Sewall's Point being the sufferers in this respect. At the Norfolk & Western piers movement is prompt, chiefly owing to an increase in the foreign bunker demand. The Hampton Roads f.o.b. circular price of $2.85 is still well maintained. Offshore and government requirements, although still limited, have slightly increased. Pennsylvanias continue weak, owing to the abundant supply of the Southern coals, and their prices are from $1 to $1.65, f.o.b. mines, according to grades. Contract demand is inactive and tide-water and all-rail requirements are light. Georges Creek continues to move regularly on contract with a slightly increasing demand for any surplus of this grade. Marine market remains unchanged, coastwise chartering being still weak. Rates from Hampton Roads to Boston are 70@75c. per ton.

Quotations are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$1.00@1.55	$1.25@1.60	$1.67@1.77	
Philadelphia*	2.25@2.75	2.50@2.85	2.92@3.02	
New York*	2.55@3.05	2.80@3.15	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.85@2.90
Boston†				3.72@3.82
Providence†				3.72@3.87

*F.o.b. †On cars.

Anthracite—The market is softer, owing to the past week's warm weather and to the decrease in the Western demand. The lack of stove coal is still the most important feature here.

NEW YORK

Superficial softness in bituminous that will soon be eliminated when colder weather appears. Consumers well stocked. Hard coal dull with operators depending entirely on contracts. Stove coal relatively easy and chestnut becoming tight.

Bituminous—The weather continues adverse to a large consumption of coal, and the trade is still quiet. A great many reports of an acute softness are heard, but the tendency is to exaggerate in that direction. Close observers of market conditions are generally agreed that the softness is more of a superficial nature, and that the trade has an excellent, though possibly not generally apparent, foundation. As a rule, reports of a weak market are confined mostly to the smaller companies, not equipped with an adequate selling organization; the larger operators are doing a big business, and the tonnage movement is steady.

Stocks on the hands of the consumers are generally conceded to be large, but this fact loses its significance in view of the fact that they are taking pains to prevent their supplies from being reduced. This is due to the anticipation of possible severe weather, which, in view of the present condition of the market, would probably result in an acute situation.

No important tonnages are reported on demurrage, and there seems to be only the normal amount of consignment coal at tide. The docks at South Amboy were reported choked up with coal, but this proved to be due to inadequate handling facilities. Production in the mining district is reported generally at full rated capacity, some companies even establishing new high records. We quote the New York market unchanged from last week as follows:

West Virginia steam, $2.60@2.75; fair grades of Pennsylvania, $2.70@2.80; good grades of Pennsylvania, $2.80@2.90; best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.15@3.25.

Anthracite—There is a total absence of snap to the hard-coal market. Things are abnormally quiet, and operators are depending entirely on orders they already have on hand. Line business is closing down, outlying dealers who had placed orders for a certain number of cars weekly, having reduced this number by half or requested a complete cessation of shipments for the time being. It is entirely a weather market. However, it is noted that the mines continue working at full capacity, there being plenty of cars and labor, while petty strikes in the mining regions seem to be at a minimum for the time being.

The principal development in anthracite during the week has been quite a perceptible easing up in the pressure for stove coal. Such a severe shortage of this grade was anticipated that operators conserved their supplies in every way possible; this resulted in diverting a great deal of the demand to other sizes, with the result that a surplus of stove coal has developed. Egg coal is dull, broken well taken care of, while chestnut is the strongest of any of the prepared sizes, although none of these can be described as strong at the moment. In the steam sizes, pea is easy, while all the buckwheats are more or less active.

We quote the New York market on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	....	$5.05	
Egg	5.25	$4.95@5.25	5.30	$4.75@5.20
Stove	5.25	5.25	5.30	5.20
Chestnut	5.50	5.40@5.50	5.55	5.35@5.45
Pea	3.50	3.40@3.50	3.50	3.35@3.45
Buckwheat	2.75	2.65@2.75	2.45@2.70	2.25@2.75
Rice	2.25	2.25	1.95@2.20	1.80@2.20
Barley	1.75	1.60@1.75	1.70	1.40@1.70

PHILADELPHIA, PENN.

Weather conditions still a controlling factor in the anthracite market. Prospect of limited mining, provided there is no immediate improvement. Bituminous conditions about on a par with anthracite, with prices weakening.

Unfortunately for the anthracite business, the weather prevailing during last week did not hold out, and there has been little need for coal. The activity manifested by the retailers, while to a certain extent passed on to the operating companies, was in the main short lived, and the trade has again resolved itself into a waiting attitude. Retailers report a fair business for stove, chestnut and pea coal, but egg is anything but popular, judging from the small number of inquiries and purchases. It is apparently impossible to dispose of egg coal at the so called circular price, and many of the individuals are forcing the market by making concessions. Even pea coal is not moving off as rapidly as it should at this season.

The renewal of contracts for the coming year is now occupying the attention of many of the operators. It is understood that some of the sizes are likely to show an advance over the figures quoted for last year. Broken coal consumption has, during the past few years, increased to a great extent, and it would not be surprising if an additional 25c. per ton, not including the state tax, is added to the figure ruling during the present year. It is understood, however, that the contract price of pea, buckwheat and rice is likely to remain the same, plus the state tax, of course. One hears of cases where strenuous objections are registered, to its imposition, but in the majority of these, sufficient arguments are brought to bear to make the purchaser see the matter in the proper light. Irrespective of the legality of the measure, which the courts have not as yet decided, the fact remains that the state will insist upon its collection until directed otherwise, and there is nothing for the producer to do but pass it on to the consumer.

Prices for line as well as tidewater remain about the same as last week, with the exception of a further tendency to weakness on the part of egg coal, by the individual operators.

One still hears unfavorable reports regarding conditions in the bituminous market. The shipments from tidewater have fallen off considerably, and the line business to local points is almost entirely confined to contracts, and unless prompt shipments are made, cancellations are quite frequently in order.

BALTIMORE, MD.

Pessimistic feeling pervades the trade. Business expected at this time is not being done. A number of contract cancellations. Export trade brisk, and the best feature in the situation.

There is keen disappointment in the local coal trade because business is so flat. Not a few of the coal men here have had a number of their best customers cut down on their contracts. This is now touching a number of lines of business, and most of the industries concerned seem doubtful as to just when they may expect a resumption of really active trade.

With an easy car supply in both West Virginia and Pennsylvania the mine interests have been prepared to ship much larger quantities of coal than are required. The result has been forced selling in many cases which has, of course, meant cheap coal. West Virginia products have been selling at anywhere from 80 to 90c., while the less desirable Pennsylvania coals have been commanding around 90c. generally, with best grades being held fairly firm for any considerable quantities at $1.35.

The export trade is quite brisk just now, however, and several important loadings were made at the Curtis Bay and Port Covington piers the past week. Prospects in this trade for some weeks to come are said to be excellent.

Dealers in anthracite have been doing a fairly brisk business in domestic sizes. These are for the most part in easy call. Steam coals are in only fair demand. Anthracite as a whole is in much better condition, at the moment, than soft coal.

CENTRAL STATES

PITTSBURGH, PENN.

Better demand on account of colder weather, resulting in less price cutting. Operations continue at about 60%. Connellsville coke quiet with price prospect somewhat uncertain. Production and shipments decreased.

Bituminous—The coal market has been considerably stronger the past week, due to the colder and more seasonable weather. There has been an excellnt run of rush ordrs, individually small, on account of weather conditions. Manufacturing demand continues relatively light, and, if anything, has decreased in the past week, though to no material extent. On the whole the trend has been toward a stiffening in prices through the elimination of most of the cutting from list figures, but it remains the case that the quotable market is not above the regular season basis, the advance of last October being entirely forgotten. Mine operations continue at the reduced rate inaugurated when the lake-shipping season closed, about 60% of full capacity. Labor and cars are in good supply. We quote, with occasional shading: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1½-in. steam, $1.50; 1¼-in. domestic, $1.55, per ton at mine, Pittsburgh district.

Connellsville Coke—The Producers' Coke Co. has definitely stated to consumers that it will not depart from its regular asking price for furnace coke on 1914 contracts, $2. In some quarters it is intimated that this does not preclude it from selling prompt of December at lower prices, but there are no definite reports of its having done so. It represents about one-third of the total merchant capacity. Among the outsiders there are several whose output is partly taken up by long-term contracts in force, and thus there is a distinct possibility that the $2 price will eventually obtain. This deters outside operators from selling at deep cuts from $2, and while quotations have been named as low as $1.85 or $1.90, they are far from general. Prompt coke, on the other hand, is easily obtained at $1.75. The market has been quiet as to transactions and negotiations for contracts are neither numerous nor eagerly prosecuted. Production is at about 75% of capacity, in the Connellsville regions, and is thus making a better showing than pig-iron production, indicating that Connellsville is probably supplying a slightly larger proportion of the total coke consumed than was the case early in the year. We quote: Prompt furnace, $1.75; contract furnace, $1.85@2; prompt foundry, $2.50@2.75; contract foundry, $2.50@2.75, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Dec. 6 at 321,927 tons, a decrease of 22,181 tons, and shipments at 321,631 tons, a decrease of 35,154 tons.

BUFFALO, N. Y.

Still a very slack coal market. The touch of winter was too brief to affect the trade for the better. Bituminous grows weaker and anthracite is in light demand for the time of year.

Bituminous—There is no added firmness to the market. In fact it appears that the demand is lighter every succeeding week, with consequent lower prices. While it is a fact that some of the better-known shippers are still getting some orders at old prices the bulk of the business has to be done at more or less of a reduction. For this reason it is hard to give any price. Shippers try to hold to full quotations and sometimes insist on former prices as a possible help to that end, but jobbers and salesmen, being usually bears in the trade, insist on much reduced quotations. The worst of it all is that there is so little demand. As a rule the seller is unable to turn over a car in case he is left with one on hands, for consumers as a rule have already taken all that they can store. A considerable falling off in consumption is evident and the prospect is that this decrease is not yet at an end.

Quotations are therefore weak on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny Valley coal about 25c. lower.

Coke—The long period of sagging in the coke market is not at an end. With the production of pig iron light and not increasing there can be no stiffening in coke. Members of the trade who formerly reported full prices now incline to a reduction, as though they saw no immediate hope of a recovery of the old firmness. Quotations are on a basis of $4.60 for 72-hr. Connellsville foundry, with demand light.

Anthracite—The two or three days of winter weather out Dec. 10 had some steadying influence on the market d if it had continued the demand would have been good in short time, but such was not the case and the trade is ain dull.

Anthracite shipments by lake for the week were 25,300 ns, which gives a total of 93,100 tons for December, a large nount, with one company still taking tonnage and making statement as to future proceedings. The 5,000,000-ton ark has already been passed, for the season's water trade.

TOLEDO, OHIO

Local railroad yards badly congested, the P. R.R. alone ving over 2400 cars it is unable to move. As a result empties e in short supply. Mines curtailing production and circu- r fairly well maintained, in spite of adverse conditions.

The past week has been full of developments on the cal-coal market. Heretofore the car situation has not been d but during the week a decidedly serious condition has veloped and the Toledo yards are badly congested. The nnsylvania railroad alone has more than 2400 cars of coal ady for connecting lines which are unable to accept them. ne roads have been unable to move cars so that hundreds empties lined up on switches and in yards in this vicinity e not available for use. Lack of sufficient motive power on e part of railroads has been given as a reason for the ouble by some while others claim that the replacement of ooden cars by steel cars has something to do with the situ- ion as not so many new cars are provided as were form- ly in commission. In any event the congestion is real as is so the fact that there are plenty of empties unavailable for e.

In consequence of this condition and the slump occasioned the cessation of navigation, mines are curtailing their out- t and coal is not being generally forced on the Toledo mar- t to the detriment of prices. Quotations are holding fairly ose to the list although there is some cutting, confined rgely to track coal and such coal as has been left on the cks after the close of navigation. There is more fuel on e local docks than was at first supposed would be the case, e to the fact that boats were greatly delayed, owing to e recent storm and also to the expiration of all insurance nce all the harbor lights are out.

Domestic coal is slow, owing to the warm weather for the st month, a condition wholly unexpected and unusual in is section. The slump in steam coal has not been as arked as had been feared and the operators have shown e good judgment to curtail production. A little cold eather will put the Toledo market in good shape and the ly threatening situation lies in the congestion of the ilroads.

COLUMBUS, OHIO

Declining market checked by a few days of colder weather hich stimulated domestic trade. Prices still weak, however, d there is no immediate hope of an advance. Decrease in eam tonnage reported.

The few cold days of last week was a boon to the coal ade although the effects were only temporary. The rapidly clining market was arrested for a time and prices have t yet reached the stage of demoralization. The levels hich prevail, however, are considerably lower than those the past month. Unsteadiness characterizes the trade and e smaller operators are cutting quotations in order to force siness.

The greatest improvement was seen in domestic lines. A w dealers which had rather low stocks placed orders for ocking lump and the fancy grades. But orders have been w and far between because retailers stocks are unusually ge for the time of the year. Dealers are not disposed to der more at this time and take their chances on pay- g demurrage.

Every mining district in the state is well supplied with rs. In the Hocking Valley the output for the week is esti- ated at 90% of normal and the same is true of the Pomeroy nd field. In the domestic fields the output has been large d in Eastern Ohio the production has been about 85% of e average. There is some slowness shown in steam busi- ss in every part of the country. Few if any of the larger eam users are disposed to stock up for emergencies but me railroads are stocking although their daily requirements e not as large as formerly.

Retail trade is rather slow as might be expected under isting weather conditions. Dealers are unable to keep their ams busy and trade is the dullest in years for the time of e season.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
mestic lump.....	$2.00 @ 1.85	....	$2.25 @ 2.15	$1.75 @ 1.65
inch............	1.80 @ 1.70	$1.30 @ 1.20	2.00 @ 1.90	1.50 @ 1.44
t...............	1.30 @ 1.20	....	1.55 @ 1.50	1.30 @ 1.25
ne-run..........	1.35 @ 1.30	1.15 @ 1.10	1.30 @ 1.25	1.35 @ 1.25
t, pea and slack..	0.85 @ 0.80	....	0.95 @ 0.90	0.80 @ 0.75
arse slack........	0.75 @ 0.70	0.95 @ 0.85	0.85 @ 0.80	0.70 @ 0.65

DETROIT, MICH.

Cancellations of orders becoming the rule. Market entirely a weather proposition. Indications point to a possible serious collapse.

Bituminous—The summer-like weather has improved transportation facilities, and there are now large numbers of cars standing on track on demurrage. Domestic trade is demoralized, and heavy cancellations on the part of the dealers has been the rule. Salesmen have again been put on the road in hopes of picking some stray orders that are still hanging fire. The market is entirely at the mercy of the weather. Stocks in all the adjoining territory are adequate, and cancellations are becoming the rule, rather than the exception.

Hocking, lump, egg and nut, have sold as low as 75c. per ton in some cases, and there are rumors that it has even been offered free for the accrued freight and demurrage charges. Steam business has showed a tendency to act in sympathy with domestic, and there has also been a curtailment in this grade. With a full car supply permitting maximum shipments and conditions continuing as adverse as they are, the coal trade is in serious danger of experiencing a total collapse.

The market is now quotable on the following basis:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump.	$1.25	....	$1.25	....	....	$2.00	$1.75
Egg...........	1.25	....	1.25	....	....	2.00	1.75
Nut...........	1.20	....	1.10	....	....	....	....
Steam lump....	1.15	....		....	....	....	....
¾-in. lump......	1.05	$1.10	1.00	$1.10	$1.10	....	....
Mine-run.......	.90	1.00	1.00	1.10	1.10	....	....
Slack..........	0.75	0.80	0.65	0.60	0.60	....	....

Anthracite—Stove and egg coal continue scarce, but the demand is light and not a large quantity is needed. A premium of 50c. per ton is being asked on stove coal, and 25c. per ton on pea.

Coke—Connellsville is in absolutely no demand, foundry grades being quoted at $1.65, Solvay, $2.90, and gashouse $2.75 f.o.b. oven.

HAMPTON ROADS

Fair accumulation of coal at tidewater. Demand not so heavy. Some movement of high volatile to the New England market.

Tidewater tonnage for the week has been good although not as heavy as was expected. Even with the large amount of coal dumped there is still a fair accumulation in the various railroad yards. The greater part of the surplus fuel is being held for large government colliers although there is some free coal but suppliers having such are not cutting prices and it is probable that within a few days all surplus coal will be disposed of as considerable inquiries are being received from the New England market for large cargoes.

In addition to heavy shipments of New River and Pocahontas to New England during the week there have been several small cargoes of high volatile moving to the same market.

Continued cold weather for the last ten days has caused a somewhat better demand for anthracite coal and some of the dealers have advanced the price to $8 per ton.

LOUISVILLE, KY.

Colder weather and outlook more encouraging. Quotations improved but not yet fully recovered from slump. Production somewhat restricted.

With a week of something resembling winter weather, coal operators and dealers are somewhat encouraged, although the imminent danger of a return of mild weather has caused some nervousness. The demand has been much improved, although not as greatly as was expected. If it continues, however, as there seems no reason to doubt it will, business should improve to a marked degree. This probability of an increased demand has helped the steam market.

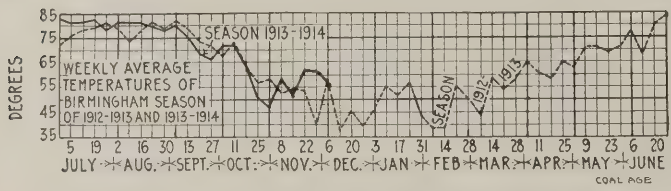
The miners are beginning to lay off for the holidays, and with something of a car shortage, there are few operations going at more than half capacity. Even without cold weather, this would naturally have the effect of strengthening the market, but if seasonable December weather is had during the next two weeks, there will very probably be a heavy demand, and an inadequate supply. Prices have not yet fully recovered from the slump caused by the prolonged period of warm weather. Sales of high-grade Eastern Kentucky block to Northern jobbers have been made at as low as $1.85 f.o.b. mines, although $2@2.15 is the more general range of prices, and even these will not continue long. Nut and slack are selling at 75@80c. Western Kentucky block is in fair demand at $1.25@1.35, while nut and slack is worth 65 to 75c., and pea and slack, which was recently a drug on the market at such prices as 10 and 15c., is stronger at 25 cents.

SOUTHERN AND MIDDLEWESTERN

BIRMINGHAM, ALA.

Coal and coke quiet. Blacksmith coal fair. Pig iron in small demand. Car shortage still prevails.

Absolute stagnation seems to be the condition of the coal business this past week, both on steam and domestic grades, and while prices are holding up well, there is only a small tonnage moving, outside of the regular contract business. Some operators are considering reducing their tonnage, preferring to do this rather than lower the price. Furnace coke is rather quiet, after a slight flurry about ten days ago, when several of the Western smelters placed orders for several thousand tons of furnace coke for shipment prior to Jan. 1, the rate to a number of the western states advancing to $2 a ton on that date. Foundry coke is being shipped only in small tonnage lots. Blacksmith coal seems to be fareing better than any other commodity, the demand being about normal.



Sales of pig iron for the past ten days have been in small lots from 40 to 200 tons, but the Birmingham manufacturers are still holding for $11 to $11.50 f.o.b. Birmingham. The heavy buying for next year has not yet started. Even with the small shipments of coal, the car supply is inadequate on several of the roads, though some of the lines are in fairly good shape.

NEW ORLEANS

Freezing temperatures bring avalanche of coal orders. Motor truck delivery found profitable and becoming general. Harbor facilities for coaling improved.

A sudden change from almost summer weather to freezing temperatures brought an avalanche of orders and city delivery systems have been taxed to the utmost during the week. As a consequence, several hundred thousand tons of coal were sold.

In order to facilitate coaling in the harbor, several new barges and derricks have been ordered. The lack of sufficient equipment of this kind oftentimes has resulted in delay when a number of boats called for coal at the same time. Cargo business is still at a standstill and in all probability forwardings of coal from Gulf ports will be lighter this winter than has been the case in many years.

Some improvement was noted last week in the Texas demand as well as in the number of orders from points in Louisiana and Mississippi. Keen competition is resulting in the efforts to land the yearly contract of the New Orleans Railway & Light Co.

INDIANAPOLIS

Some severe weather stimulated the retail trade but the mines received little benefit and are still working only about four days a week. Notwithstanding the dullness at the mines, prices hold firm. The teamsters' strike practically over.

Two or three days of what was thought to be the real start of winter weather helped the retail trade but before the increased demand could be reflected back to the mines, mild weather returned. December so far has not been much more favorable to the coal trade than November was. Operators and retailers are standing firm on prices, notwithstanding the fact that they would like to have business stimulated.

It is noticed there is considerable advertising of Indiana domestic grades in the metropolitan papers and operators say more of it is being used yearly, displacing Eastern bituminous coals. Operators are doing their best to impress the consumer that the best of the Indiana domestic grades compare favorably with the imported product.

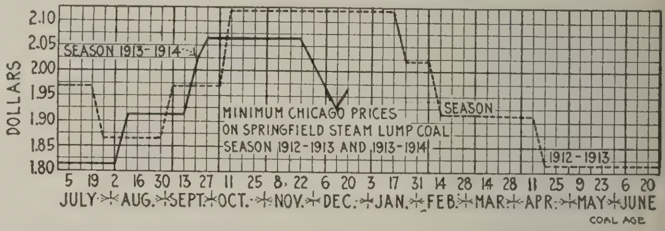
The teamsters' strike in this city, which for a time threatened to paralyze the coal trade, has been partly settled. The union has backed down on its demand for recognition and the teamsters are ready to go back, if the union schedule of wages is paid. About half the strikers are at work again but the larger employers are holding out firmly against the union button.

CHICAGO

Some recovery in the market, but continued warm weather makes the general situation soft. Smokeless lump and egg quotations remain the same, while prices for mine-run are being hammered badly. Anthracite and coke markets dull. Greater strength noted in prices for Franklin County coal.

While there has been some recovery from the depressed conditions of a week ago, the present situation is far from satisfactory. Continuation of spring-like weather is the chief cause. Practically all retailers have their yards filled to capacity and there is comparatively little demand. Many of them are taking advantage of the condition of the market, to seek lower prices.

A few dealers and small shippers have been cutting quotations on smokeless mine-run to the extent of 15c. a ton. Smokeless lump and egg prices remain about the same, the selling price, on a mine basis, ranging between $2 and $2.25. Operators in the Carterville district are pursuing the policy adopted some time ago of shutting down their mines whenever there is lack of business. As a result, prices have not weakened; domestic sizes vary between $1.60 and $1.85.



Softness prevails in the anthracite market. Distributing agents with coal on track and up to car service are cutting prices as much as 25c. a ton. Dock interests are maintaining the circular . Shipments of Hocking coal to Chicago are small in volume and prices remain steady. Franklin County coal have recovered from its previous weakness, the quotation of $1.50, the mines, named a short time ago for lump and egg having been boosted to between $1.60 and $2. Springfield steam lump and mine-run are somewhat soft; domestic lump is selling at $1.50, the mines. Indiana operators are confining their shipments to the Chicago market to contract business. A comparatively few lots of domestic lump have been sold at from $1.50 to $1.65, the mines.

Lack of activity in the iron and steel market has resulted in a depression in the coke business. Prices remain about the same.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump............	$2.32	$2.65@3.05	$2.27	
Steam lump..............	1.96		1.97	
Egg......................		2.65@3.05		$4.20
Mine-run................	1.87	2.40	1.87	3.45
Screenings..............	1.16	1.70	1.27	

Quotations on Harrisburg coal are: Domestic lump and egg, $2.65@3.90; steam lump, $2.35; mine-run, $2.35; screenings, $1.55; No. 1 nut, $2.65@3.90; No. 2 nut, $2.55.

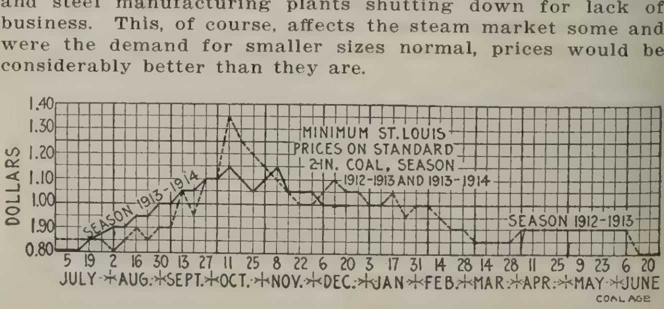
Carterville prices are: Lump, egg and No. 1 washed, $2.65 @3.90; No. 2 washed, $2.55.

Coke—Connellsville, $5.25@5.50; Wise County, $5@5.25; by-product, egg, stove and nut, $4.90@5; gas house, $4.75@4.95.

ST. LOUIS, MO.

Domestic market slow with no demand. Steam sizes showing an improving tendency. General business poor and outlook not encouraging.

There is no change in local conditions, with the exception that screenings are in better demand and seem to be bringing a fair price; if warm weather continues this condition will do likewise. Domestic demand has fallen off considerably, as the weather is not cold enough to bring about a normal consumption and the steam demand has slackened in the last week or ten days, due principally to the large iron and steel manufacturing plants shutting down for lack of business. This, of course, affects the steam market some and were the demand for smaller sizes normal, prices would be considerably better than they are.



For the first time in several weeks there is no anthracite under demurrage on the east side; 18 cars that were under demurrage for a matter of two weeks were sold to a big retail company a few days ago for $6.65 at St. Louis, or $2.65 at the mines, for egg size. This is 60c. below the St. Louis circular.

The prevailing market is:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump	....	....	....	**$1.00***
3-in. lump	....	....	$1.40*	....
6-in. lump	$1.30 @ 1.50	$2.25	1.50*	**1.20***
Lump and egg	1.85 @ 2.15	....	....	....
No. 1 nut	1.40 @ 1.60	....	....	....
Screenings	0.40 @ 0.50	....	....	....
Mine-run	1.10 @ 1.20	....	....	....
No. 1 washed nut	1.75	$2.25	1.40	....
No. 2 washed nut	1.35	....	1.60	....
No. 3 washed nut	1.15	....	....	....
No. 4 washed nut	1.05	....	....	....
No. 5 washed nut	0.50	....	....	....

* Asking price.

KANSAS CITY, MO.

Market dull with little or no business being negotiated. Quotations holding remarkably firm in view of the adverse conditions.

Though the weather is more satisfactory in Kansas City, it has failed to improve the situation greatly. However, there is a snap in the atmosphere which augurs well and operators are more optimistic over conditions. More coal is being burned in all quarters, and dealers' stocks are being reduced quickly enough to promise well for the future. The wholesalers have not yet been affected, however, and will not be for some time, unless a real cold wave makes its appearance.

The market is steady, operators realizing that the lethargy afflicting the business is due merely to the unseasonable weather. It is believed that a lowering of prices would have no material effect on the movement, and prospects are for a stationary market until colder weather appears.

OGDEN, UTAH

Lower temperature in some localities helps to move coal. Mines working hard to keep from accumulating nut. Storm on eastern slope of mountains will stimulate Kansas and Nebraska market. Quotations remain unchanged.

A few localities in the Rocky Mountain district were recently visited by a storm which will have a tendency to create a greater demand for coal. However, conditions as a whole have not improved greatly and while all mines are working at capacity, they are in doubt as to whether or not they can continue unless there is a decided change in the near future.

Nut coal still continues to be a source of much trouble and while the mines are moving this grade, there are times when it seems there will be a surplus. This condition has effected the price somewhat and quotations are weak. Lump and slack coal are moving through to destination rapidly and all districts are being well supplied.

Quotations have not changed and are as follows:

	California	Colo. & Neb.	General
Lump	$3.00@3.50	$3.25	$2.75
Nut	2.50@3.00	2.50	2.25
Mine-run	1.85	1.85	1.85
Slack	1.00	1.00	1.00

FOREIGN MARKETS

GREAT BRITAIN

Dec. 5—Owing to a strike of railwaymen on the Great Western system, many collieries are idle; the ports principally affected are Swansea and Port Talbot. The general feeling is that a settlement will be come to in the course of a day or two.

Cardiff coals are practically fully booked for December. There are many inquiries for the first quarter of next year, buyers' ideas being about $4.32 for seconds.

Quotations ae approximately:

Best Welsh steam	$5.04@5 16	Best Monmouthshires	$4.38@4.50
Best seconds	4.74@4.92	Seconds	4.08@4.20
Seconds	4.62@4.74	Best Cardiff smalls	2.64@2.76
Best dry coals	4.56@4.80	Seconds	2.40@2.52

The prices for Cardiff coal are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, exclusive of wharfage, and for cash in 30 days.

PRODUCTION AND TRANSPORTATION STATISTICS

THE CAR SITUATION

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended Dec. 1, as follows:

	Surplus	Shortage	Net*

[1] Includes coal from connecting lines.

[2] Includes company's coal.

[3] Does not include company's coal hauled free.

Note.—Southern Railway handled 366,464 short tons of coal during August and 2,776,062 short tons during the 9 months ending August.

ANTHRACITE SHIPMENTS

The November shipments of anthracite amounted to 5,786,931 tons, which is the lowest record for that month since the panic year of 1907, when shipments touched 5,743,522 tons. A decrease in shipments was naturally to be expected in view of the unseasonable weather and consequent lack of demand from the consuming interests. The movement for the year to Dec. 1 shows an increase of 5,740,934 tons over that for the same period last year, and with a heavy shipment this month it is possible for the hard coalers to break their previous high record for the year, 69,954,299 tons made in 1911.

The following is comparative statement of the anthracite shipments for November and the first eleven months, of the years 1912-13, in long tons:

	November		11 Months			
	1913	1912	1913	%	1912	%
Phila. & Reading	1,119,247	1,243,111	11,856,164	18.70	11,628,506	20.16

COAL FREIGHT DECISIONS

I. C. C. No. 5734—Huerfano Coal Co. vs. Colorado & Southeastern R.R.

1—Each carrier subject to the act is charged with the duty of furnishing cars for the transportation conducted over its line.

2—A carrier's obligation to furnish cars for shipments to points upon the lines of its connections is joint with the latter, and contracts with them can not relieve it of its portion of such joint liability.

3—Trackage contract between Colorado & Southeastern R.R. and Colorado & Southern Ry. found to cause an undue discrimination against petitioners in the matter of car supply.

COAL SECURITIES

DIVIDENDS

Beech Creek R.R.—Regular guaranteed quarterly dividend of 1% payable Jan. 2 to holders of record Dec. 23.

Little Schuylkill Navigation R.R. & Coal Co.—Dividend of $1.25 payable Jan. 15, to holders of record Dec. 11 to Jan. 14.

St. Louis, Rocky Mountain & Pacific Co.—Regular quarterly No. 6 on the preferred stock of 1¼% payable Dec. 31 to holders of record Dec. 21 to Dec. 30.

Coal & Iron National Bank—Quarterly dividend of 1½% payable Jan. 2 to holders of record Dec. 10.

American Coal Products Co.—Regular quarterly on the common stock of 1¾% payable Jan. 2 to holders of record Dec. 25 to Jan. 2, and 1¾% on the preferred stock, payable Jan. 15 to holders of record Jan. 11.

* * *

The Consolidation Coal Co.—The capital stock of this concern is $31,190,500, which includes $6,190,500 additional stock authorized in February of the current year, for the purpose of taking up some outstanding bonds. The company has now paid dividends for 26 years and since 1905 has maintained an annual disbursement of 6%.

Pittsburgh Coal Co.—Earnings of this company last year, which was the best since 1907, amounted to only $2,025,500, or less than 7½% on the preferred stock. In view of this showing it looks very doubtful if the $10,800,000 accrued back dividends on the 7% cumulative preferred stock will ever be paid.

The Lehigh Valley Coal Sales Co.—Together with the announcement of the 25% dividend by this company, it is stated that 25% additional stock will also be issued to which stockholders are permitted to subscribe in proportion to their holdings. The dividend, therefore, is really a stock dividend. The new stock will amount to $1,515,200, bringing the total outstanding capital stock up to $7,576,000.

Bond County Coal Co. (Illinois)—This company incorporated in Illinois with an issued capital stock of $200,000, does not propose operating on its Bond County properties, but will merely hold them in reserve for the future. The property has been well proved by diamond drilling; it is underlaid with the No. 6 Illinois seam which is clean and has a strong rock and slate roof and hard fire clay bottom. The thickness of the vein ranges from 6½ to 9 feet.

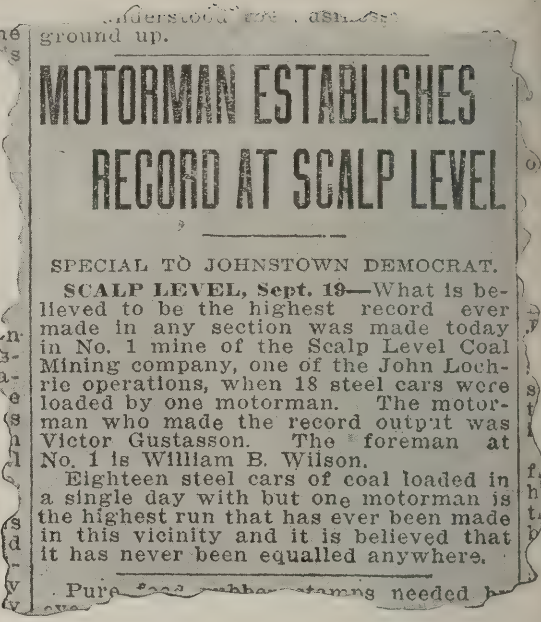
Provident Coal Co. No. 1 Plant, St. Clairsville, Ohio

18 Fifty-Ton Railroad Cars Loaded In a Day With One Baldwin-Westinghouse BARSTEEL Electric Mine Locomotive



ground up.

MOTORMAN ESTABLISHES RECORD AT SCALP LEVEL

SPECIAL TO JOHNSTOWN DEMOCRAT.

SCALP LEVEL, Sept. 19—What is believed to be the highest record ever made in any section was made today in No. 1 mine of the Scalp Level Coal Mining company, one of the John Lochrie operations, when 18 steel cars were loaded by one motorman. The motorman who made the record output was Victor Gustasson. The foreman at No. 1 is William B. Wilson.

Eighteen steel cars of coal loaded in a single day with but one motorman is the highest run that has ever been made in this vicinity and it is believed that it has never been equalled anywhere.

On this particular day they worked exactly nine hours and forty-five minutes. The only haulage equipment used was an eight-ton Baldwin-Westinghouse **Barsteel** Electric Locomotive, equipped with commutating-pole motors.

This locomotive, except for a few mine cars hauled from a dip from a point in the heading by a mule, did all the work, gathering the coal cars and hauling the same to the tipple.

When they stopped work in the evening the locomotive was inspected and found to be in first-class condition, in spite of the heavy work it performed. The motors were nearly as cool as when started in the morning.

Twelve mine cars, each loaded with two tons of coal, were hauled on each trip. The longest haul was made about 2500 feet from the face of first left to tipple and about the same distance from face of main heading to tipple. At two points in the mine for a distance of 400 feet the grades are 1½% against the loads.

Thirty-six trips were hauled, and it is estimated that at least two minutes were lost on each trip on account of the motor man waiting for empty cars outside.

There was no extra effort made this day to make a record. It was only an ordinary day's work, and it is believed that if they would make an extra effort, for any one day, this Baldwin-Westinghouse **BARSTEEL** Locomotive could gather and haul sufficient coal to at least load twenty-four steel cars.

Full information about Baldwin-Westinghouse BARSTEEL Electric Mine Locomotives can be obtained by addressing either company.

HAPPY NEW YEAR

The old year's winging to its close
We're almost ready for the New,
The old year had its joys and woes
But when we pass them in review
We find the skies were often blue
In spite of clouds that we recall,
And now the year is almost through,
Here's Happy New Year to you all!

We've preached to you in plodding prose
Of Advertising, false and true,
We've marshalled facts in rows and rows
And written sermons not a few,
Perhaps you've muttered, "That'll do,"
Or softly murmured, "Hire a hall!"
—Ah well, the year is almost through,
Here's Happy New Year to you all!

We've done our durndest, heaven knows,
To help ourselves by helping you,
And if we've trod on people's toes
Or thrown some tempers all askew
We're sorry—and that's honest, too!
We would be friends with great and small,
And now the year is almost through,
Here's Happy New Year to you all!

COAL AGE

Vol. 4 NEW YORK, DECEMBER 27, 1913 No. 26

For The New Year

By Berton Braley

Written expressly for Coal Age

Now we have come to the first of the year,
Time to start in on a record that's clear,
Time to begin on a page that is clean,
How shall we fill it in nineteen fourteen?
What shall we make it—a year full of self,
Greed and Unkindness, and struggle for pelf?
Or plan out our lives on a better design,
Up in the office or down in the mine?

How shall we play in the game that is life,
Make it a battle, a war to the knife?
Or fill it with tenderness, honor and truth,
With succor to age and with welcome to youth?
Let us be true to the best that we know,
Owner or Miner—on top or below—
Let us be brothers, whatever our line,
Up in the office or down in the mine.

Now we have come to the first of the year,
Let us start in for a season of cheer,
Let us be true to the faith and the job,
Workmen who serve—and not bandits who rob!
Whether we handle a pick or a pen
Let us be servants and comrades of men,
Making life nearer the Master's design,
Up in the office or down in the mine!

Start the New Year with New Determination

Every normal man is ambitious to a certain degree. In some people this feeling is narrowed down to a definite aim; there is not a diversity of desires—only a single aspiration, and all effort of the individual is directed with the idea of attaining this one goal. Such men are specialists in the true sense of the word.

There are others, however, who are ambitious in a general way. Success to them is a broad term and covers a mighty field of action. They want to excel, but are not particular as to the line of work in which they engage, so long as the material results are satisfactory. They are honest men, and often efficient, but they lack concentration—singleness of purpose—which is a most essential quality in this age of specialization.

Start the New Year with a settled aim and a definite ambition. You are in the coal-mining business, and it's one of the nation's greatest basic industries. There are approximately a million men engaged in the work, and they need thousands of leaders. This insures those who are deserving, an opportunity to advance, if they are made of the right stuff.

And the lower down you are in the scale of employment, the more jobs that beckon you on. There are twice as many foremen as superintendents, and three times as many of the latter as there are managers. But none of these positions is to be obtained, or afterward held, unless the individual is willing to pay the price in earnest labor seriously and intelligently rendered.

Right now is the time of the year when you should balance your accounts. Have you anything to show for the work of the last twelve months? If you haven't, then you have done worse than stand still, for you are a year older, and just that much nearer the time when you can't be so sure of the punch left in your fighting arm.

Have you devoted a few hours each week to study and to keeping informed on the progress of your industry? Or, have you spent all your evenings trying to banish care and drive worry from your mind? Too many men think that "worry and care" can be expelled by a song and a bottle; but they seem to forget that such expulsion is only temporary, for the old lady will always be back with them "the morning after." You may drive the old hag away time and again while money and health last, but finally she will come back and stay to the finish.

The only way you can forever banish care is to meet her squarely, study her methods and discover her motives. Then you may get rid of her permanently by first understanding her. Freedom from worry and consequent "peace of mind" must be earned. Relief through alcohol and dissipation will prove as transitory as the opium fiend's dream of wealth and power.

If you haven't strengthened your position during the year that is dying, resolve that the coming twelve months will be devoted to preparing for the future, and be occupied in making your position in life safer. A little sensible worry now will mean peace later, for nothing is more terrible than to plod along under the crack of the whip when old age has come on. If you don't believe this is true, look about at the shuffling feet and nerveless hands of those who were careless in youth.

Don't you think it is time you stopped looking for luck to bless you, or Providence to hand you something, and come to the conclusion that hard work alone will solve your problems and net you a real return? Isn't it time you determined to live within your income and save something, no matter how little it may be? Now is the time to labor, to sacrifice and endure hardship, for when the years have piled upon you, it will be found that old age itself is sufficient punishment for one person to bear.

It's all very fine to be known as a good fellow, but it's still better to be spoken of as a respected citizen of much ability and serious intent. You have made many resolutions before, no doubt, and some of them you have broken; however, as the New Year commences, determine to do better and begin by first discovering just where you are deficient. The chances are that you yourself have been your own worst enemy, and that the greatest obstacles in your path have been of your own making.

Remember that, although everyone cannot become famous, anyone with health can avoid being an utter failure. Some of those now working with you, and having no better chance than you have, will be talked of as a success in years to come. There is no downhill in the road you must travel, it is one continuous climb; all dips in the grade lead backward. It's because so many people forget this fact that the majority fail. *Start the New Year with New Resolutions and New Courage.*

Safety of Portable Electric Mine Lamps

By H. H. Clark*

SYNOPSIS—Describes the tests applied by the Bureau of Mines to the Ceag, Hirsch and Wico lamps to determine whether they would be extinguished on the breaking of the lamp bulbs, whether the filaments were liable to cease to glow when the lamps were exposed to violence which did not destroy the bulbs and whether a reasonable degree of rough usage would impair the batteries.

⁂

Portable electric mine lamps are a comparatively new development in this country, although they have been used in European mines for some time. William Maurice, in a lecture before the University College of Nottingham, England, stated that as early as 1887, 600 portable electric lamps were installed in a colliery in South Wales. He adds that the use of these lamps was eventually discontinued, but that 10 years later portable electric lamps were used regularly in England as a substitute for flame lamps, over 1000 lamps being in daily use by the latter part of 1899.

E. N. Zern stated in the *Coal and Coke Operator* of Mar. 14, 1912, that in 1904 several thousand portable electric lamps were in use in the mines of England and Belgium. Portable electric lamps are now used extensively in European coal mines, and in a competition held recently in England, 195 different lamps of this type were entered. For at least five years and probably for a longer time, portable electric lamps have been used here and there in the mines of this country in the attempt to develop a satisfactory substitute for the safety lamp.

Electric Lamps Safer than Flame Lamps

The Bureau of Mines advocates the adoption of the electric lamp because fire and explosion hazards will be decreased thereby. It is therefore manifest that the electric lamp itself must not be a source of danger. The bureau has proved by actual test that the glowing filaments of portable electric lamps are capable of igniting mine gas, but that sparks from such equipments of not more than six volts cannot ignite the gas unless the equipments are unusually large.

When, therefore, the bureau decided to make tests to establish the permissibility of lamps for use in gaseous mines, sparks were ignored as not being an element of danger while safeguards were required for the glowing filaments. Schedule 5, which was issued to announce the bureau's tests, contained the following paragraph:

> Permissible portable electric lamps shall be so designed and constructed that under no circumstances can the bulb of a completely assembled lamp be broken while the lamp filament is glowing[†] at a temperature sufficient to ignite explosive mixtures of mine gas and air.

Bureau's Approval of Lamps Limited to Safety Qualities

The schedule gives in detail the requirements of design, the character of the tests to which the lamp is to be submitted, and the conditions under which the tests will be made. Beyond requiring that the mechanical construction of the lamps should be rugged, no attempt was made to insure the capacity, efficiency or practicability of the lamps tested, although those that were manifestly incomplete or inadequate for mine service were not accepted for test. Therefore, it is clear that the bureau's approval of a lamp as permissible means that it vouches for the safety of the lamp but not for its capacity, time of burning, or expense and labor of maintenance.

In response to the invitation contained in Schedule 5, six lamps were submitted to the bureau for test. Three of these were rejected on account of their inadequate construction or lack of safety devices. The other three lamps were tested and after changes were made in some of them, they were approved as permissible for use in gaseous mines.

When the lamps were first received they were carefully examined in order to determine what kind of a blow would be most likely to cause the safety devices to fail in the performance of their function. The most dangerous conditions being assumed, tests were made under these conditions to determine whether or not the safety devices would really prevent the filament from igniting gas when the bulb was broken. Other tests were made to determine whether or not the safety devices were so constructed that they would give trouble by extinguishing the lamp when there was no need for such action and finally experiments were made to test the mechanical strength of the battery and its casing.

The Ceag Lamp

The Ceag lamp is constructed for hand service, and is the first lamp which was approved by the Bureau as permissible for use in gaseous mines. The lamp bulb is suspended between two spiral springs in such manner that whenever either the bulb or the glass dome which surrounds it is broken, the electric current of the lamp will cease to flow.

A preliminary examination seemed to indicate that there were only three possible ways in which the lamp could ignite gas.

1. It was conceivable that both the outer glass and the bulb might be so broken that the electric circuit would not be interrupted and the filament would therefore continue to glow.

2. The blow breaking the dome and the bulb might be of such a nature as to pin the bulb in place so that it could not release from the circuit even though the top spring were thrown out of position. The possibility that the safety devices might fail as a result of either of the above occurrences was investigated by 33 tests.

3. Even though the automatic devices operated perfectly when the lamp was broken, it was conceivable that they would not operate fast enough to interrupt the circuit before the gas became ignited. The possibility of failure under such circumstances was investigated by 13 tests.

The Filament Is Frequently Intact but Light Is Extinguished

These were made by placing the lamp inside a sheet-iron box 18x18x24 in., filled with the most explosive mixture of Pittsburgh natural gas and air, and provided with observation windows through which the phenomena occurring within the box could be plainly seen. The lamps were lighted and smashed by means of a tool shaped like a pick point, which was driven against the glass dome of the lamp with sufficient force to wreck both the dome and the bulb.

*Engineer-in-charge of electrical investigations, Bureau of Mines, Pittsburgh, Penn.

Note—First part of paper read, Dec. 5, 1913, at the winter meeting of the Coal Mining Institute of America.

[†] We submit that "while the lamp filament is glowing" should read "in such manner as to permit the filament to glow."—Ed.

In the tests that were made to ascertain how quickly the safety devices acted, the bulb was not surrounded by the glass dome, but was held in place by the top spring, which was held in its usual position by a wooden block provided specially for the purpose. Despite the fact that the blows administered to the lamp were sufficient to shatter both the outer dome and the lamp bulb, the filament was not injured in nearly 40 per cent. of the tests made, and was prevented from igniting the gas only by the operation of the safety devices, which did not fail to perform their proper functions in any of the tests.

One of these Ceag lamps was dropped 6 ft., 15 times upon a concrete floor. Despite the severity of this test the lamp was extinguished only three times and in each case by the safety device. The lamp was dropped 5 times before the battery was injured in any way, and 12 times before a permanent leak was made in the battery jar. After the lamp had been dropped 15 times, it continued to burn for 16 hr. before going out entirely.

The Hirsch Lamp Is Protected by Short-Circuiting and Circuit-Breaking Devices

The Hirsch lamp is designed for cap service, and was the second type approved by the bureau as permissible for use in gaseous mines. The safety devices with which this lamp is equipped are mounted in the headpiece and consist of an open-circuiting device which protects the lamp against blows from the front, and a short-circuiting provision, which defends the lamp against blows from the side.

The open-circuiting device is operated by the breaking of a slip of window glass which is mounted directly across the inner surface of the bulls-eye with which the lamp is provided. The breakage of this slip of glass releases a spring which opens the circuit. The short-circuiting of the lamp is accomplished as follows: The headpiece is made up of three concentric shells separated but a short distance. The outer and the inner shell are connected to the positive pole of the battery and the intermediate shell to the negative pole. These shells, of course, completely surround the lamp bulb, and the theory of the safety device is that the bulb cannot be broken without so jamming these shells together that they will short-circuit the battery and thus extinguish the filament before it can ignite gas.

Whenever the Bulb Breaks, the Current Fails

Forty-five tests were made upon this headpiece by striking it with the following tools: A hammer, a wooden mallet, a tool shaped like a miner's pick, a piece of iron pipe, and a wooden club. Some of these tests were made while the headpiece was rigidly supported in various ways and others were made while the headpiece was swinging from the end of its cord.

The blows were struck with sufficient force to crush the headpieces, to shatter the glass in almost every case, and to punch holes completely through the shells, but every time that the lamp bulb was broken the safety devices extinguished the filament. In some of the tests the lamp was protected by its circuit-breaker and in others by the short-circuiting device.

In order to find out whether or not the safety devices would extinguish the lamp when it was not necessary they should do so, the headpiece and its cord were dropped 6 ft., 10 times upon a concrete floor. The safety devices acted in only one test and the action was considered to be necessary as the blow that tripped the circuit-breaker also shattered the outer glass of the headpiece. These tests therefore seemed to prove that the safety devices were so designed that they would only extinguish the lamp when necessary. This lamp was designed to be interchangeable for cap and hand service, but its construction was considered to be insufficiently strong for the latter purpose and so it was approved for use on the cap only. The nature of cap service being less severe upon the battery than hand service, the battery was tested by dropping it on a wooden floor a distance of 3 ft. The battery jar was cracked on the second fall, but the lamp still gave its full amount of light after the battery had been dropped 10 times.

The Wico Lamp

This lamp is designed for cap service, and was the third lamp approved by the bureau as permissible for use in gaseous mines. The bulb is so mounted that it is held in its socket by a wire stirrup against the pressure of springs that act to eject the bulb should the stirrup be removed or the bulb broken.

The tests made on this lamp were similar to those made on the Ceag lamp because the principle of the protective devices was the same. Ten tests were made by mounting the headpiece in the gas-testing gallery and smashing the bulb with a pick-pointed testing tool. In these tests the outer glass was removed and the blow directed against the naked bulb in order to determine whether or not the ejecting spring acted with sufficient speed to break the circuit before the gas could become ignited. The device acted perfectly in the 10 tests made.

Ten similar tests were then made with the outer glass in position, and as many more were tried with the blow directed against the socket tube. Finally 10 tests were made outside the gas-testing gallery by striking the headpiece with a mallet, a club and a piece of iron pipe. These latter tests were made largely to determine the mechanical strength of the various parts of the headpiece. In none of the tests did the safety devices fail to exercise their safeguarding function.

Proof against Unnecessary Extinction

Ten tests were made by dropping the headpiece and its cord upon a concrete floor from a point 6 ft. above it. The safety device did not act in any of these tests and consequently it was proven that a casual jar would not extinguish the light. The lamp being designed for cap service only, the dropping tests on the battery were made by dropping it 3 ft. upon a wooden floor. Ten tests were made altogether. The battery jar did not develop a crack until it had been dropped 8 times. After the completion of the dropping tests, the battery operated the lamp for 16 hr. at practically full brilliancy.

⁂

The coal supply of Oklahoma is estimated to be 10,000,000,000 tons. The state contains more than 6,000,000 acres of coal-bearing land. Some of the land is estimated to be capable of yielding 7000 tons per acre.

A Premier Operation in Ohio

By Sim G. Reynolds*

SYNOPSIS—A description of a new operation which is termed "premier" instead of "model" merely because mines rejoicing in the latter appellation are notoriously dangerous.

⁂

One and one-half miles from St. Clairsville, and about 12 miles West of the Ohio River in Belmont County, Ohio, is located colliery No. 1 of the Provident Coal Co. If the management would allow it, this mine might be designated as being a "model." There seems, however, to be something sinister in the way in which Fate has dealt with our so called model mines in recent years. This serves to give the management of a mine which is really deserving of such a cognomen a species of spinal shivers every time they hear it mentioned.

Superintendents and managers of well planned mines, fully equipped with every modern appliance for economy and safety, are not superstitious, but we all know what has happened to most of the operations which have been proudly designated as "models" in the last decade.

So in order to break the "hoodoo," if any exists, we are compelled to substitute a term synonymous with all that is good and modern in mine methods and equipment as relates to its installation at a given operation, and at the moment at least nothing more nearly designative of what we want to describe occurs to us than the word "premier." The reason for selecting this appellation will perhaps be more apparent when the equipment and methods of operations are more fully comprehended.

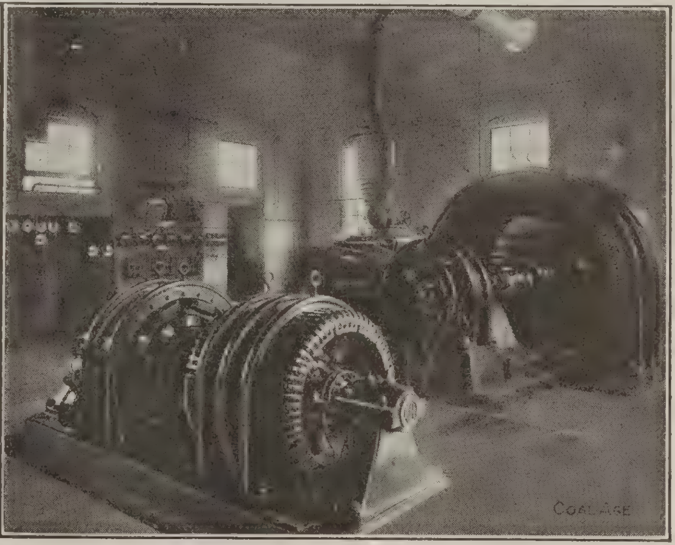
An Extensive Field Is Reached

The shaft is sunk to the Pittsburgh No. 8 seam, and into a block of this splendid coking and gas-producing coal comprising almost 8000 acres in one field. This is to be eventually worked out from the mine in question, or No. 1, and also from colliery No. 2, which is, in many respects, a counterpart of the first. It will be readily admitted therefore that this is a man-sized proposition, particularly since it is the intention of the owners to extract the utmost possible percentage of the coal measures before abandoning the mines.

The entire plant, inside and out, has been arranged with this purpose definitely in view. No. 1 colliery was opened about nine years ago, and the output of the mine is shipped over the Adena branch of the Wheeling & Lake Erie R.R. At the point where the shaft was sunk, the coal lies about 86 ft. below the surface, and while at many points the hills rise above the level of the shaft mouth to such an extent that the survey shows 300 or more feet of overlying strata, yet the mine is nongaseous. The natural dip of the seam at this locality is about 17 ft. to the mile, east.

This colliery is laid out and equipment installed to handle 2500 tons per day. The system of mining is the ordinary room-and-pillar method generally in vogue in this seam, butt entries being turned off at about 450-ft. intervals, with rooms turned off the butts on 33-ft. centers, with 9-ft. ribs between rooms.

The Tipple and Power Plant



A Corner of the Engine Room

Both Mules and Motors Are Used

Haulage of coal from working places to shafts is at present accomplished part by mule and part by motor. One 12-ton, three 6-ton and one 5-ton electric locomotives are used to haul the coal from the partings to the shaft bottom, with 15 mules transporting it from the working places to the partings. Haulage is in no sense difficult in this locality, owing to the even grade of the coal measure.

Undercutting is done by 19 electric chain machines, 17 of them being of the 19-A Jeffrey type. Transportation is accomplished by four hundred and fifty 2¼-ton capacity wood cars. Hoisting from mine to surface is accomplished by a Wellman-Seaver-Morgan hoist with a capacity of four cars per minute. The engines are fitted with a Nicholson overwinding device.

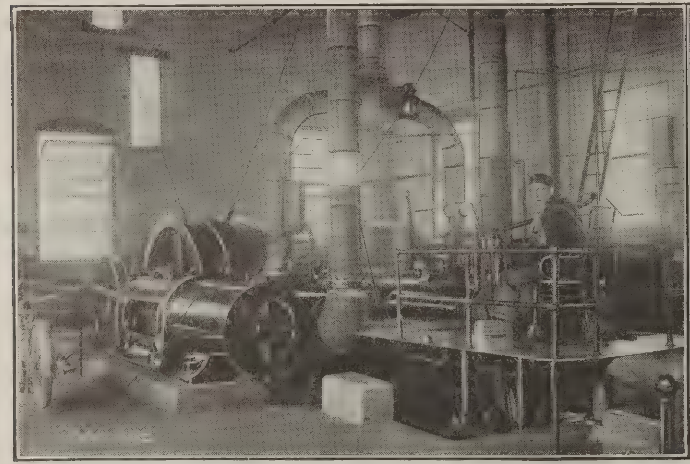
The mine is splendidly ventilated, in keeping with other uptodate measures, by an 8½x16-ft. Cappel fan,

---

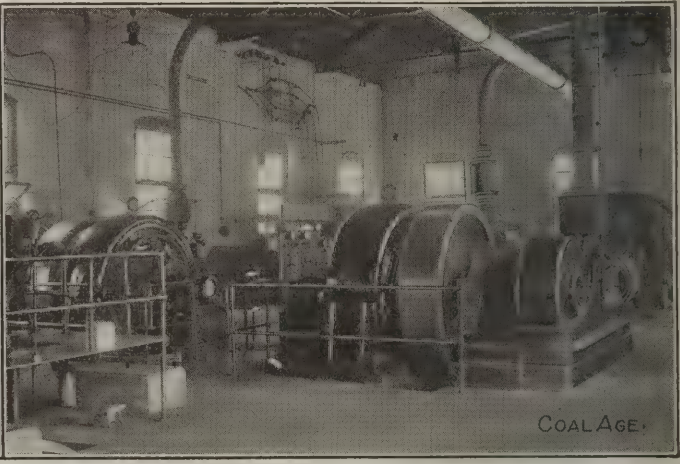
*Aetna Insurance Co., Hartford, Conn.

98,000 cu.ft. of air per minute being produced at a speed of 100 r.p.m. against a 2½-in. water gage. At the shaft bottom and along much of the main roadway and traveling-way is installed a most modern system of lighting and timbering. The comparatively great strength of steel I-beams is here being taken advantage of to protect the roadways and shaft bottoms from falls that would otherwise inevitably cause loss of time and money in a roof as brittle as this. In addition, this gives the space essential to a free movement of men, motors, and animals impossible where wooden supports are employed.

The electric lighting used throughout nearly all the main roads, as well as in the shaft bottom, is an innovation which is fortunately becoming more common. It is still rare, however, in comparison with what it would be if managers and owners of nongaseous mines only realized the wonderful possibilities for economy and safety that lie in a well lighted shaft bottom and main haulage and traveling-ways. We venture the assertion that if this single feature of a modern mine like that under discussion were but properly investigated and understood the stygian blackness of most of our soft-coal mines would in a short time be a thing of the past, insofar as the shaft and slope bottoms, the drifts and the various traveling-ways and the main haulage roads are concerned.



Hoisting Engine at Colliery No. 1



Generators at Colliery No. 1

Likewise, the constantly decaying, death-dealing, fall-producing wood cross-piece as generally used to uphold the more or less brittle strata forming the roof of the Pittsburgh No. 8 seam, would give way far more rapidly than it is doing at present to the stauch steel I-beam in wide entries, particularly if the ultimate economy and the present merits of the steel supports were better understood.

Many investigations of the comparative benefits to be derived from the use of the I-beam for this purpose have convinced the writer that its installation is far more generally justified in the interest of ultimate economy, present efficiency and the welfare of the employees than many mine owners will allow themselves to believe.

The Tipple Is of Steel

The tipple at colliery No. 1 was designed by George S. Baton, of Pittsburgh, Penn., and erected by the Pittsburgh Construction Co. of the same place. It is built entirely of steel, and is equipped with two Phillips automatic cross-over dumps. Screening apparatus is also provided to produce the following grades: One, and one-quarter inch lump, nut and slack coal, run-of-mine and ¾-in. lump.

Slate and other refuse is dumped at the tipple and conveyed to the refuse heaps by means of an aërial tramway system, which is an improvement over the method of slate handling generally in use. This slate-disposal system is not considered as being the least of many features installed at this plant with the single aim in view of ultimate economy of operation and present efficiency both combined with speed and safety.

In the matter of power the plant is equally uptodate. Steam is generated by two batteries of 150-hp. Erie boilers, and two batteries of 125-hp. Stirling boilers, the draft being furnished by a brick stack 150 ft. high, and 4 ft. in inside diameter at the top.

Electric current is generated by two 200-kw. Westinghouse, and one 500-kw. Ridgway generators, both being direct-connected to Erie-Ball engines. These machines also supply electric current for the operation of all machinery at Colliery No. 2.

The mining town in which live most of the employees of No. 1 colliery, is composed of 88 houses of four rooms each, built double, and six 6-room houses for the use of mine officials. All these are of frame construction and neatly painted in gray with white trimmings. Each house is provided with a good sized garden divided from its neighbor by a well-built, neatly painted fence.

The Water Supply Is Adequate

The welfare of the employees and their families is equally well cared for in other respects, the water supply being remarkable for a mining community. This water supply is modern and sufficient for all purposes, a reservoir holding 13,000,000 gallons, having been built under contract by William N. Miller, of St. Clairsville, Ohio. The water from this reservoir first passes through a filtering system erected by W. B. Scaife & Son, of Pittsburgh, and reaches the houses and other buildings under pressure.

The office buildings, engine and generator rooms, boiler and fan houses, and in fact all the mine buildings except the tipple, are built of a buff-colored brick, presenting an appearance quite in keeping with the rest of the plant. The work at this colliery since its beginning has been un-

under the close supervision of Superintendent David Thomas, and general manager, F. Armstrong. Mr. Thomas will be remembered by most mining men of the Pittsburgh field as having been active in the operation of some of the most extensive bituminous mines in that region, including the large Ellsworth colliery. He is evidently a manager who has the happy faculty of combining the conservative qualities of the old-school manager with the enthusiasm and optimism necessary to grasp and utilize all that scientific theory offers an uptodate mine manager. The underground workings are in charge of foreman Peter Dlesk, assisted by Henry Whitlock, and Martin Jalensz.

A complete equipment of mine-rescue apparatus is kept on hand at No. 1 mine, including oxygen helmets and other necessary first-aid supplies. A noticeable arrangement for the prevention of accidents is an automatic safety gate which opens only when the cage is at rest at the ground landing. This is the product of A. J. Allsop, of Jerome, Penn. It is but one of many efforts made by the Provident Coal Co. to conserve the life and limb of every person in its employ.

⁂ ⁂

Experiments with Animals in Carbon Monoxide

By George A. Burrell and Frank M. Seibert

SYNOPSIS—Results of careful experiments indicate that canaries are best adapted for exploration work. Both animals and men may be affected differently by the same proportion of carbon monoxide, and because some animals have an abnormally high resistance to the gas, more than one animal should be used at a time.

⁂

The usefulness of small animals in detecting vitiated air in mines is well established. The Bureau of Mines and others have much information on this subject, but in order to make this paper brief, accounts of their practical use or of accidents which occurred because they were not used will not be given here.

The Bureau has experimented with most of the more common small animals, such as canaries, guinea pigs, rabbits, chickens, dogs, mice and pigeons, and finds that canaries or mice are the most suitable for the work. Of the two the Bureau finds canaries to be the more sensitive. They were used in England before their acceptance in this country; presumably in places on the Continent also. Their usefulness in husbanding the resources of breathing apparatus is of great importance.

An additional reason for the use of canaries lies in the fact that they are generally easily obtainable, and become pets of the men who have them. If handled intelligently in rescue operations, they seldom die as a result of their exposure to carbon monoxide.

In rather a brief manner, one of the objects of this paper is to give the results of experiments by the Bureau which have shown that canaries may be used repeatedly in rescue operations without danger of their being more susceptible to carbon-monoxide poisoning after many exposures. This fact had not been determined experimentally hitherto, as far as I am aware. A second important investigation is into the relative effect of carbon monoxide on men and small animals. Carbon monoxide was the gas experimented with because it is that constituent of afterdamp, which is most insidious in its action, most difficult to detect, and responsible for many of the deaths caused by mine explosions. Moreover, small animals feel distress sooner than men in atmospheres vitiated by other gases than carbon monoxide, and so their action in all irrespirable gases will serve as a valuable indication of the presence of those gases when in quantities dangerous to human life.

Effect of Repeated Exposure to Carbon Monoxide

Details of these experiments will be given later in a publication of the Bureau. They will only be outlined here. Canaries, mice and guinea pigs were repeatedly exposed to carbon monoxide under different conditions. In some experiments they were exposed to atmospheres that distress them in about 2 minutes. In the case of canaries, 0.25 per cent. was used in some experiments and the animals were exposed 7 to 10 successive times.

For instance, the animal was exposed to collapse, and then when it had apparently recovered (7 to 12 minutes), it was exposed again and again, the object being to see if, after many exposures to a certain percentage of the gas, they would upon subsequent exposures show distress in a greater length of time, i.e., become more or less acclimatized to the gas. No acclimatization effect was noticed.

The same experiment was performed with mice and guinea pigs with the same result. Other percentages beside 0.25 per cent. were also used in the case of both canaries and mice. The experiments were also carried further to the extent that the same animals that had been exposed several or many times on one day were exposed many times the next day and on successive days.

Animals were also exposed to percentages that quickly distress them, and after removal from the atmosphere and recovery, were placed in atmospheres that ordinarily do not apparently affect fresh animals. This experiment was also reversed, the animals being first placed in atmospheres which do not affect them (for a long time, at least), say 0.10 per cent. in the case of canaries, and then they were exposed to atmospheres that ordinarily affect them quickly, to see if results different from the ordinary could be obtained.

In performing this work, the results of which can be briefly told, but which required considerable time for its performance, the conditions of recovery work with the aid of small animals were kept in view. In such work parties would usually advance until the animals showed distress. The animals would then in all probability be carried back to fresh air, and further advance, if such were made, would be accomplished with breathing apparatus. A general reconnoissance might be made with the animals to define the danger zone of the mine. In the latter event they might be exposed to proportions of carbon monoxide that would in each case cause collapse.

Note—Paper presented before the Coal Mining Institute of America, Pittsburgh, Penn., Dec. 4-5, 1913. Published with the permission of the Director of the Bureau of Mines.

SEVERAL OTHER POSSIBLE CONTINGENCIES

It may happen, in other cases, that the animals may be first used in a part of the mine where very small percentages of carbon monoxide exist, say 0.10 per cent., a proportion that does not usually seem to affect canaries or mice within one or two hour's time (as far as can be observed) and then they may be used in a place where a larger percentage may be present. It is possible, too, that an animal which collapses at a certain place because of the proportion of carbon monoxide there, might upon recovery be used in an atmosphere containing a proportion that does not usually affect a fresh animal. Finally, the same animal might be exposed over several successive days while a mine was being explored.

It is believed that the experiments performed show that animals will not become acclimatized to carbon monoxide under the conditions surrounding recovery work in mines, and hence become less useful and even a source of danger. It might be mentioned that this question has been raised several times in discussing the use of small animals for detecting afterdamp in mines.

It should be mentioned that two Canadian investigators, G. G. Nasmith[1] and D. A. S. Graham, found that animals finally become acclimatized by continued exposure, i.e., if a guinea pig is exposed for days or weeks to small percentages, it can finally stand exposures that would otherwise kill it, but our tests have shown that in the case of small animals which are quickly removed to fresh air (after distress is shown) and then exposed again for a reasonable number of times, this acclimatization effect is not apparent. The two methods of experimentation are not parallel. It is pertinent to add that the effect Nasmith and Graham observed in guinea pigs—an increase in the red-blood cells—has been observed in men working around blast furnaces, the gas from which contains a high percentage of carbon monoxide.

EFFECTS ON DIFFERENT ANIMALS OF THE SAME PROPORTIONS OF CARBON MONOXIDE

The Bureau has performed many experiments in order to draw some conclusions regarding the effect on different animals of the same species of a given proportion of carbon monoxide. It was found that in general a given percentage of that gas affected different animals of the same species in about the same length of time. The results were, at least, closely enough in agreement to justify reliance on the use of animals in mine-rescue work, but once in a while an animal behaved markedly differently from what was expected. This is more true of mice than of canaries, yet even in the case of the latter several of them should be taken with an exploration party.

THE RELATIVE EFFECT OF SMALL AMOUNTS OF CARBON MONOXIDE ON MEN AND SMALL ANIMALS

In reading over accounts of rescue and recovery work in mines, one is impressed with the fact that some users of small animals have not been entirely satisfied with the behavior of mice and birds (especially mice), because men have apparently felt distress before the animals became affected. The Bureau as the result of many experiments made to determine the resistance of small animals to carbon-monoxide poisoning believes it has the data at hand which explains this dissatisfaction.

It was found, for instance, that almost all of the animals tried, do not show sufficient distress in one hour's time, with 0.10 per cent. of carbon monoxide, to make them valuable for detecting this percentage of the gas. In some cases the length of exposure was extended to three hours without any effects being observed. In one case only was a canary affected in so short a time as 12 min. by 0.10 per cent. of carbon monoxide.

With another bird and the same percentage of carbon monoxide, distress was scarcely observable in three hours. Only a disposition to remain quiet was observed. Eight different canaries were used and six different mice. Only one mouse out of many was slightly affected in so short a time as 30 min. with 0.10 per cent., and even it was not overcome in 4 hours. Neither chickens nor pigeons were visibly distressed.

In an atmosphere containing 0.15 per cent. of carbon monoxide, canaries showed distress in from 5 to 30 min. A mouse showed slight distress at the end of an hour. With 0.20 per cent. canaries responded in from two to five minutes except in one case (35 min.). Three mice responded in 12 min., and a fourth in 46 min. No blood tests were made, the object being to determine the usefulness of the animals for mining work, where their behavior as apparent to the eye is the only guide. Haldane states that 0.06 per cent. carbon monoxide is sufficient to produce distinct symptoms in mice.[2] We do not hesitate to say that because of his greater experience in experimenting with small animals, Dr. Haldane might detect outward symptoms in a mouse that would escape our attention. On the other hand, we have had greater experience than many of those who might use small animals in mines. Further, in the laboratory, observations are better made than in the mine where the light may be poor.

Dr. Haldane made many experiments with himself as the subject in determining the effect of carbon monoxide on men.[3] He found that 0.12 per cent. causes a mouse to sprawl in 11 min. Haldane felt a slight tendency to palpitation in 33 min. In 90 min., he had distinct dimness of vision and hearing and a slight tendency to stagger, besides abnormal panting when he stopped the experiment long enough to run up and down stairs. In two hours' time vision and hearing became markedly impaired and there was some confusion of mind. When the mouse was finally removed from the cage it could not move about. After 18 min. from the time of stopping, Haldane had a distinct throbbing headache which did not last long.

THE MINIMUM HARMFUL PERCENTAGE OF CARBON MONOXIDE

With 0.045 per cent. of carbon monoxide, Haldane did not notice any symptoms in the four hours that the experiment was carried on, but on running upstairs there was unusual panting, slight palpitation, etc. A mouse was not distinctly affected. In defining the minimum harmful or poisonous percentage of carbon monoxide, Haldane states that 0.05 per cent. in pure air is just sufficient to produce in time very slight symptoms in man, and the same percentage produces very slight symptoms in mice. He states that 0.20 per cent. is very dangerous to man. With 0.05 per cent. and thereabouts, Haldane finds that the gas finally begins to affect man and the outward signs appear in mice.

[2] The relation of the action of carbonic oxide to oxygen tension. J. S. Haldane, "Journ. Physiology," Vol. 18, 1895, pp. 201-217.

[3] The action of carbon monoxide on man. Jno. Haldane, "Journ. Physiology," Vol. 18, 1895, pp. 430-462.

Haldane's observations on mice are not entirely in accord with our own researches. The reasons are probably, as already stated, differences in observation. We are convinced from our experiments that in a mine with poor light, and perhaps only hurried examination of the animal, and by persons more or less inexperienced in the actions of such animals, mice and canaries will not usually show distress pronounced enough to give good warning with 0.10 per cent. or less of carbon monoxide. Haldane's work shows that this percentage may finally affect men—a headache in 40 or 50 min. perhaps, or slight tendency to palpitations in less time. This condition will be a considerable time removed from actual distress or unsteadiness of movement. At the end of 20 min., one of the authors had only a slight headache when he exposed himself to 0.25 per cent. carbon monoxide (in air). Later, however, he became very ill. Canaries collapsed in just a few minutes.

In connection with the above laboratory experiments, we have made observations regarding the use of small animals in mines. One instance is noteworthy, as follows:

A mine fire recently occurred and a sample of mine gas was obtained that contained the following constituents:

SAMPLE OF MINE GAS

CO_2	1.10 per cent.
O_2	18.61 per cent.
CO	0.12 per cent.
CH_4	0.42 per cent.
N_2	79.75 per cent.
Total	100.00 per cent.

This sample was obtained in a place where exploration work was being conducted. Canaries carried with the party were not affected, but two of the men finally complained of a bad headache. Later when they went to the surface they became ill. One was indisposed all evening. The birds were with the men continually.

These facts, although they appear damaging against the use of small animals for the purpose proposed, only militate in part against their usefulness. They still remain, in our opinion, the best indicators of carbon monoxide for exploring parties in mines that we have. Canaries will give ample warning of percentages of carbon monoxide immediately dangerous to men. When the proportion of carbon monoxide is 0.15 per cent., canaries will show distress usually in from 5 to 12 min. With 0.20 per cent. the distress is apparent usually in from 2 to 6 min. For distress to appear in men with those percentages requires much longer time, although in the case of some individuals the effects may, when they do appear, last for hours. We have also determined this point experimentally, as have others. Men cannot stand the exposure to collapse from carbon monoxide as animals can. Canaries and mice after distress and collapse recover quickly if exposed to fresh air—only a matter of minutes usually. In the case of men exposed to collapse, recovery is often a matter of days.

Reasons for Variable Effects of Carbon Monoxide on Men

In assigning reasons for the variable effects produced on men and small animals by small quantities (say 0.10 per cent. and under) of carbon monoxide, we would say that it is largely a question of observation. The blood of the animal is, of course, taking up the carbon monoxide, but only slowly and to the extent that even after a long time, one hour or more, the only effect in the animal may be a slight sluggishness or disinclination to move about. Men, on the other hand, especially when moving about or doing hard work, absorb much more oxygen and hence more carbon monoxide than when at rest, and may finally feel a slight or even a severe headache in the same gas mixture that is only slightly or not affecting the animals (as far as can be observed).

The men may even finally become very sick. It is not believed that any pronounced acclimatization effect is produced in an animal on a short exposure which would account for the apparent resistance. It must be remembered that a man is in an excellent position to determine effects upon himself long before distress occurs, in the case of small percentages of carbon monoxide.

When the carbon-monoxide content of an atmosphere is raised from 0.10 per cent. to say 0.15 or 0.20 per cent., the susceptibility of a canary or mouse to the gas is markedly increased, as judged by the action of the animal—so much more than in the case of men that a canary especially may show distress in 5 min., while a man may require 30 or more min. A man, if he exposes himself so long, however, may finally become quite sick, and if he remains in the poisonous atmosphere for longer periods, may become dangerously affected.

The Gas May Affect Different Persons in a Different Manner

The Bureau has compiled data from different sources to show the effects produced on different persons by carbon monoxide. The fact is clearly brought out that the gas may affect different persons in a different manner. Long-standing after-effects produced in people by severe poisoning, although apparently rare, are by no means unknown. It appears to be the evidence usually that recovery from exposure is complete, but that in the case of some individuals long-standing after-effects may follow.

These after-effects on different people cannot be connected absolutely with any degree of exposure, i.e., one short exposure to large percentages, repeated exposures to large percentages as usually happens in the case of blast-furnace gas, or slow exposure to collapse with small percentages of the gas, as in the case of miners exposed to the smaller percentages that are found in mines following explosions.

In the case of the same individual the final blood saturation is what counts. The point is that different people may withstand different degrees of blood saturation. In the case of blast-furnace men, the same men may be exposed to collapse or severe temporary sickness time and again. Usually, as far as can be observed from their behavior, they retain their normal condition, although, as has been pointed out by Thomas Oliver,[4] severe after-effects may linger for two years.

This appears to be exceptional. An Illinois commission appointed to inquire into conditions around steel plants, found it hard to separate effects on steel workers produced by bad living conditions and those produced on some of the men by carbon monoxide, although they were inclined to the view that carbon-monoxide poisoning had much to do with the generally poor condition of some of the employees. The exact action of the gas in producing severe nervous disorders still remains somewhat obscure. Some do not believe the action so simple as to merely temporarily deprive the system of oxygen, as in the case of suffocation, although most of the good experimental evidence points to this view.

---

[4] Thomas Oliver, "Diseases of Occupation," p. 67.

An analogy is found in men who work at high altitudes or suddenly ascend to extreme heights in balloons, where the oxygen tension is very low. Different individuals also may be affected differently at high altitudes. One must believe that in cases both of carbon-monoxide poisoning and oxygen deprivation by other causes, the idiosyncrasy of the individual plays an important part. Others have laid much stress on this point.

Guinea Pigs May Become Immune

As regards acclimatization to the gas, it has been strikingly shown that guinea pigs may become immune. The compensation found in pigs has also been in part observed in men. The red-blood cells increase to compensate for those put out of action by the carbon monoxide. How long this may continue without markedly distressing men is important.

Repeated exposure to carbon monoxide may occur in the case of miners, in those who do the shot-firing. Blasting explosives always produce some carbon monoxide in coal mines. Men may return too quickly to the working face (before gases have disappeared), to examine their shot, and thus expose themselves to percentages, usually small, of the gas. Where large shots are fired, where the ventilation is poor, and where the working faces are too far ahead of the last breakthrough, contact by men with harmful percentages of carbon monoxide and other poisonous gases may follow. Miners at some mines frequently go home sick from powder smoke. The general effect of such exposure on them cannot be anything but bad.

Afterdamp Will Differ in Composition

In the conduct of exploration work one sometimes hears it said that certain individuals of a party were able to withstand atmospheres that caused distress in other members of the same party. This may be true because some men are more affected than others by the same proportions of the gas, but one or two other causes must be kept in mind. Afterdamp in different parts of a mine (in some places quite close together) will differ much in composition, to the extent that at one place a very small and insignificant amount of carbon monoxide might be present, while at another place, close by, a harmful proportion might exist. One person in a party unknowingly might encounter the latter atmosphere while his comrades do not.

Another reason usually less apparent to an exploring party has to do with the fact that the amount of carbon monoxide absorbed depends, of course, upon the air breathed. A man at rest may breathe 7 or 8 liters of air per minute. By even moderate exertion this can be increased to 3 or 4 times that quantity. It follows that if one or more members of an exploring party work harder than others they will become poisoned more quickly than their fellows.

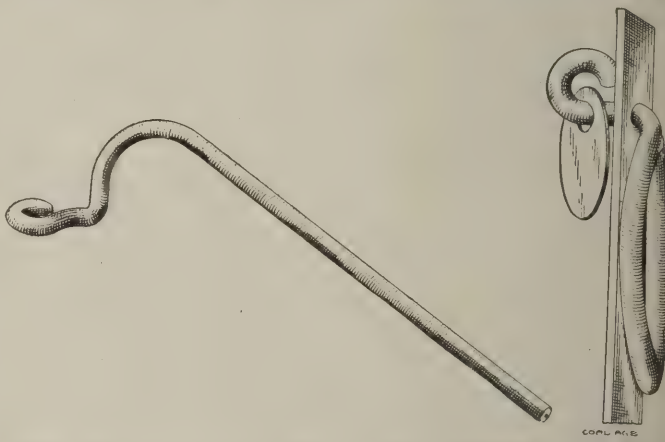
Summary

1. Small animals may be used repeatedly in exploration work without becoming less useful as indicators of carbon monoxide.
2. Of the more common small animals, canaries are best adapted for exploration work.
3. Men may feel distress, especially if they work hard, in the presence of small proportions of carbon monoxide (0.10 per cent, or under) when animals at rest in their cages do not show it distinctly.
4. It is found occasionally that different animals of the same species may be affected differently by the same proportion of carbon monoxide; hence more than one animal should be used at a time.

⁂

Safety Hook for Miner's Check

In the Langenbrahm mine at Essen, Germany, and in a number of Upper Silesian operations, a clever device for attaching the miner's check to the car has been used with satisfaction. It is described in *Glückauf,* and consists of an iron rod hooked at one end and originally straight at the other. The straight end is thrust through a hole in the side of the car and then bent into a ring which hangs down.



The Check Hook before and after Insertion in Side of Car

The check can be hung on the hook only when the ring inside the car is free to be lifted. When the car is full the coal holds the ring flat against the side so that no one can tamper with the check. This device is manufactured by the Rheinischen Handelsgesellschaft m. b. H., of Mörs, Germany.

⁂

John Lind—Coal Miner

There are probably few people in the country who are aware of the fact that John Lind, President Wilson's personal representative in Mexico, was at one time identified with the Western coal industry. About 20 years ago, Mr. Lind and others, of Salt Lake City, Utah, developed what has later proved to be one of the most enduring and successful of the Western coal operations. The company was organized under the name of the Diamond Coal & Coke Co., the operation being located at Diamondville, in what was then Uintah County, Wyo. Their original opening, No. 1 mine, is still in operation. Some time later, practically the entire capital stock of the company was taken over by the Amalgamated Copper Co., and it has since proved to be the most important and valuable of that company's large coal properties.

Notes on the Clinkering of Mixed Coals

By R. D. Quickel[*]

SYNOPSIS—Some interesting data on the clinkering of fuel mixtures of different coals at high temperatures, with particular reference to railroad work. The author comments on the well known inconsistencies in clinkering and gives detailed results of some interesting problems he has met with.

⁂

The object of this paper is to call attention to some facts, relative to the combustion of mixed coal, the unsatisfactory results sometimes experienced when burning them and the reasons for same. I have also endeavored to evolve some rules whereby it may be determined whether or not clinkering will result when certain coal or coals are burned in a locomotive firebox. The locomotive firebox has been used in the practical and theoretical work connected with this paper, because a locomotive under maximum working conditions generates temperatures higher than are probably generated in any other common combustion chamber.

Some Peculiarities of the Clinkering Problem

As to the clinkering of coals the latest textbooks mention that such a thing occurs, but give no reasons as to the actual cause, although some of them do mention that the ash of the coals have something to do with it.[†] Every user of steam coal has discovered fuels which would not give him satisfactory results, and large consumers have also discovered that they could not use a mixture of certain coals. In all cases the results were only found after an immense amount of trouble. These errors in purchasing fuel are most expensive.

The fuel-purchasing department of the Queen & Crescent Route discovered years ago that it was impracticable to mix certain coals together and get satisfactory results, and that it was necessary to run actual locomotive tests with the mixed fuel to find out if it would give maximum steam pressure. For instance, we draw our present fuel supply for the Cincinnati, New Orleans & Texas Pacific Ry. from four separate and distinct districts. From three of these districts we can, and do, mix the coal indiscriminately on our coal chutes, while that from the fourth district will not burn without clinkering, if mixed with any of the other coals from the three districts mentioned; in other words, if we were to come to a coaling station with about half a tank of fuel from the fourth district, and were to fill the tender with coal from any of the other three districts, we would, in a short time, have clinker trouble on our locomotives, which would result eventually in an engine failure.

With our present equipment we have found that sometimes either one of the two coals would be absolutely satisfactory when used by itself, but when mixed, these same two coals proved entirely unsatisfactory. We have also found that sometimes certain mixed coals will give perfect satisfaction in our stationary boiler plants, but when used on a locomotive they proved as complete a failure.

As previously stated, actual experience on locomotives has shown that certain coals or certain mixtures of coal will clinker. If we can find any simple method of determining by calculation from a true analysis, involving both proximate analysis of the coal and the ash analysis, whether a coal will or will not clinker, we have discovered something which should be of help, both to the coal dealer himself and the man who buys coal. It has been my experience that a great many coal salesmen fool themselves in regard to their own product.

Today, when a steam coal must stand on its merits with regard to contract based on B.t.u.'s, and ash and sulphur content, a coal salesman cannot know too much about the fuel he is trying to sell. A contract let through misrepresentation, or ignorance, works a greater hardship on the seller, eventually, than on the buyer, on account of the bad reputation given the coal, and those who sell it. Different coals are not all suited for the same purpose, a great deal depending on the drafting, grates and temperatures reached in the various combustion chambers.

Kinds of Clinker

There are two separate and distinct kinds of clinkers formed in locomotive operation. The hard clinker is formed largely by improper firing and the other, known as the molasses clinker, is formed by the fusing together, or slagging, of the coal ash. Improper firing can never be directly responsible for the formation of a molasses clinker, but will undoubtedly hasten its formation. The hard and the molasses clinker differ widely in chemical composition, as is shown by the following analyses:

	Hard Clinker	Molasses Clinker
Silica	56.50	35.04
Alumina	35.20	17.32
Ferric oxide	4.96	37.12
Lime	0.66	7.42
Magnesia	0.83	1.12
Potash	1.14	0.87
Soda	0.43	0.63
Sulphur	1.00	trace
Titanium dioxide	trace	0.50
Total	100.72	100.52

These clinkers differ more widely in their formation and action in the firebox than they do in chemical composition. The hard clinker gives the firebed, in the spot where it is formed, a dead appearance, which stays approximately the same size as when first formed. This clinker can be easily removed by simply pulling it out of the fire, or by turning it upside down or on its side when it is simply disintegrated by the action of the fire. The hard clinker has a tendency to stick together, and will not break when an attempt is made to remove it.

The molasses clinker is altogether a different proposition. When first formed its appearance in the firebox is similar to that of the hard variety, but instead of staying approximately the same size as when first noted, it will continue to grow larger in area. When it covers an area of approximately 4 sq.ft., small blue flames about 3 in. in length will be noticed coming up through it and also at the edges if examined when the engine is working or with the blower on. This clinker will continue to grow until the entire surface of the firebox is covered. Upon attempting to remove it, we find that it will be soft, as compared to the hard clinker, and as fast as the upper part or crust is taken off it will be noted that the semi-ash underneath has run together like thick molasses.

---

[*] Fuel agent, Queen & Crescent Route, Lexington, Ky.

Note—Paper read at the mid-winter meeting of the Kentucky Mining Institute, Lexington, Ky., Dec. 8, 1913.

[†] Probably one of the latest discussions on this subject is that by F. R. Wadleigh, which appeared in "Coal Age," Vol. 1, p. 1207, and was supplemented with a discussion by Wm. B. Phillips on page 111 of Vol. 2, and A. Bement on page 218. Another article on the same subject will be found on page 862 of the same volume.—Editor.

Examination of the ash pan and fire grates is also surprising. The clinker is found to have run down between the grate fingers and where hardened, hangs from the grate bars in long strings like icicles. Upon attempting to shake the grate, we find this impossible, as the clinker has filled the spaces between the grate bars, and has solidified to such an extent as to prevent any chance for motion in the grate fingers. The only way a clinker of this character can be removed is to clean the entire firebox and build a new fire. Of course, in a case of this character, we have experienced a disastrous engine failure.

For anyone familiar with metallurgy or the principles thereof, it is evident that in the formation of a molasses clinker a metallurgical reaction of some kind has taken place. My attention was first called to the matter of calculating the slags in coal ash by an article in the *Colliery Engineer,* by E. B. Wilson, editor. In this article and a subsequent one, read before the Coal Mining Institute of America, Mr. Wilson advocated the use of Ballenger's Factors in connection with the metallurgical calculations which would be involved in figuring slags from the percentages of silica and the various oxides, as shown in the ash analysis of a coal. I applied these factors in some calculations connected with practical engine tests and found them to give excellent results.

DEFINITION OF A MONOSILICATE SLAG

There are more than likely three different kinds of silicate slags formed in the fusing together of coal ash at high temperatures. However, as we are certain of the formation of the monosilicate variety, I will use this slag as typical in the following discussion.

A monosilicate slag is one in which the ratio of the oxygen in the base is to the oxygen in the acid as one is to one. For the benefit of those unfamiliar with metallurgical terms and chemical formulas, the following is given as an illustration of a monosilicate slag, expressed as a chemical formula. The slag formed in this case, formula for which is shown on the right-hand side of the equation, is known as a calcium monosilicate:

$$\begin{array}{ccccc} \text{Lime} & & \text{Silica} & & \text{Calcium Monosilicate} \\ 2\,CaO & + & SiO_2 & = & 2\,CaO\ .\ SiO_2 \end{array}$$

It will be noted that because the silica contains two atoms of oxygen as written on the left-hand side of the equation, to make the ratio one to one, we must use two molecules of lime. Similarly we can write the silicate slags of magnesia, alumina, and ferric oxide, as follows:

$$\begin{array}{ccccc} \text{Magnesia} & & \text{Silica} & & \text{Magnesium Silicate} \\ 2\,MgO & + & SiO_2 & = & 2\,MgO\ .\ SiO_2 \end{array}$$

$$\begin{array}{ccccc} \text{Alumina} & & \text{Silica} & & \text{Aluminum Silicate} \\ 2\,Al_2O_3 & + & 3\,SiO_2 & = & 2\,Al_2O_3\ .\ 3\,SiO_2 \end{array}$$

$$\begin{array}{ccccc} \text{Ferric Oxide} & & \text{Silica} & & \text{Iron Silicate} \\ 2\,Fe_2O_3 & + & 3\,SiO_2 & = & 2\,Fe_2O_3\ .\ 3\,SiO_2 \end{array}$$

The molecular weights and the symbols of the various atoms involved in the following calculations may be readily obtained from any international table of atomic weights. The ones given below are only those which will be used in the subsequent calculations: Oxygen = O = 16; magnesium = Mg = 24.36; iron = Fe = 55.9; alumina = Al = 27.1; calcium = Ca = 40.1; silicon = Si = 28.4.

Referring back to the equation showing a calcium monosilicate and substituting the atomic weights, we have the following:

$$2\,CaO + SiO_2 = 2\,CaO\ .\ SiO_2$$

$$112.2 + 60.4 = 172.6$$

From this equation it is readily seen that it requires $\frac{60.4}{112.2} = 0.543$ parts of silica to combine with one part of lime to form a calcium monosilicate slag. The decimal fraction 0.543 is termed Ballenger's factor for a lime silicate. Ballenger's factor for magnesium, iron and aluminum silicates is determined as follows:

Ballenger's Factor

For a Magnesium Silicate:

$$\left\{\begin{array}{llll} 2\,MgO & + SiO_2 & = & 2\,MgO.SiO_2 \\ 80.72 & 60.4 & & 141.12 \end{array}\right. \qquad \frac{60.4}{80.72} = 0.747$$

For an Aluminum Silicate:

$$\left\{\begin{array}{llll} 2\,Al_2O_3 & + 3\,SiO_2 & = & 2\,Al_2O_3.3\,SiO_2 \\ 204.4 & 181.2 & & 385.6 \end{array}\right. \qquad \frac{181.2}{204.4} = 0.886$$

For an Iron Silicate (Ferric)

$$\left\{\begin{array}{llll} 2\,Fe_2O_3 & + 3\,SiO_2 & = & 2\,Fe_2O_3.3\,SiO_2 \\ 319.6 & 181.2 & & 500.8 \end{array}\right. \qquad \frac{181.2}{319.6} = 0.567$$

Ballenger's factors for the principal oxides found in the coal ash are then as follows:

$$MgO = 0.747$$
$$Al_2O_3 = 0.886$$
$$CaO = 0.543$$
$$Fe_2O_3 = 0.567$$

The following is a proximate analysis of the various sections of the No. 4 Blocton coal, in the Blocton field of Alabama; also analysis of the ash:

	No. 1 Bottom Coal	No. 2 Fire Clay	No. 3 Middle-man	No. 4 Top Coal	No. 5 Rash
Moisture	2.00	0.83	0.91	1.33	1.35
Volatile combustible	36.03	7.07	24.36	34.71	17.12
Fixed carbon	58.52	0.72	55.98	57.16	25.98
Ash	3.45	91.38	18.75	6.80	55.55
Total	100.00	100.00	100.00	100.00	100.00
Sulphur	0.76	None	0.23	0.40	0.27
B.t.u.'s	14,150	None	12,405	13,840	Not possible to ignite on six attempts.
Ash Analysis					
Silica	11.34	52.32	28.00	20.40	60.42
Ferric oxide	31.84	5.44	12.64	14.80	3.20
Alumina	13.40	24.20	7.82	11.26	30.24
Lime	16.54	0.50	26.90	26.66	0.72
Magnesia	6.99	1.80	6.93	4.60	0.63

Carbonate		trace	much	present	none
Moisture		0.83			
Total	99.04	99.37	101.36	100.16	99.77
Fusibility in blast lamp	Fusible	Fusible	Fusible	Fusible	Infusible

This coal was used as a locomotive fuel on the Alabama Great Southern Railroad for a period of two and one-half years, although during its successful performance the fireclay parting was not, to any extent, noticeable in the seam mined during that time. The rash practically amounted to nothing. Upon renewal of the contract with the company mining this coal, and after same had run for a period of about six months, we began to have a great deal of difficulty with clinkered fires. The trouble was traced to the coal, analyses given above, and further shipments refused. An ordinary examination of the coal on the coal chutes, and in cars, did not show any unusual percentage of incombustibles. Closer examination, however, did show some little fireclay and rash in the product. The owner decided to have this coal washed, and a car was sent to a plant and the entire contents treated. I personally supervised a test of this washed coal on one of our manifest freight trains, with the following result:

A Test of the Blocton Coal

Left Birmingham Dec. 2, 1912, as first section train 77, south, engine 216, with 1360 net tons freight, 30 loads and 1 empty; maximum grade encountered for any distance, 1 per cent.; coal washed and screened over a three-quarter inch screen. A peculiar thing was noted during this test in that no matter how the coal was fired it was impossible to make any black smoke. Of course, black smoke is not desirable at any time, but the fact remains that with the majority of coals, having from 25 to 35 per cent. volatile matter, smoke is easier made than eliminated.

After the engine had been run about 30 miles, it was noticed that there was a slight dropping back in steam pressure, although several times while the engine was in side track at meeting points, the boiler popped off. On a grade known locally as Tuscaloosa Hill, about 55 miles from Birmingham, the steam dropped back to 135 lb., and it was just possible for the engine to pull the train to the top of the hill and roll over into Tuscaloosa. We had a meeting point at Moundville, 15 miles south of Tuscaloosa, and after being in the side track at this point for about 15 min., steam pressure dropped back to 45 pounds.

The first clinker of any size was noted about 40 miles south of Birmingham; it was small and of the molasses variety. The clinker grew rapidly in area, and when the test train reached Tuscaloosa, it covered the entire area of the firebox. During the entire test the slice bar was not used once, and the engine was fired by the most uptodate methods.

At Moundville an attempt was made to clean fire. It was soon discovered that as fast as the clinker was removed, what remained in the firebox ran together again, and it was necessary to knock the fire. The crust of this clinker was approximately 12 in. in thickness. It had been impossible to shake the grates for some time and upon examination of the grates and firebox, we found both completely filled with clinker. A microscopical examination of the coal showed that some of it was impregnated with small partings of fireclay and rash; it was also found in the sample of coal that there was a small percentage of both of these present.

Determining the Trouble

Referring to the analyses of both the coal and the ash, it will be found that as far as the bases are concerned, we may eliminate practically all of them, except those for which we have already determined Ballenger's factors. The sulphur is reported as sulphur trioxide, and it is probable that some part of it will combine with part of the lime, forming calcium sulphate ($CaSO_4$). Assuming that 10 per cent. of the SO_3 combines with the lime, we would have available percentages of lime, as follows:

	No. 1 Bottom Coal	No. 2 Fire Clay	No. 3 Middle-man	No. 4 Top Coal	No. 5 Rash
Lime.....	14.89	0.45	24.21	24.40	0.65

As sulphur trioxide is an unstable compound, the chances are that a large part of it will go off in the ordinary process of combustion. As we have also present some little carbonate and potash, part of the SO_3 may combine with the carbonate and potash, forming sodium sulphate, and potassium sulphate.

Taking the factor for ferric oxide, 0.567, and multiplying it by 11.34, or the percentage of ferric oxide present in the bottom coal, we have:

Fe_2O_3 0.567 × 31.84 = 18.05% of silica needed to unite with 31.84% FeO

Similarly,

$$\begin{array}{rl} CaO\ 0.543 \times 14.89 = 8.08\% & \text{of silica needed to unite with } 14.89\%\ CaO \\ Al_2O_3\ 0.886 \times 13.40 = 11.87\% & \text{of silica needed to unite with } 13.40\%\ AlO \\ MgO\ 0.747 \times 6.99 = 5.22\% & \text{of silica needed to unite with } 6.99\%\ MgO \\ \hline 42.22 \qquad 42.22\% & \text{of silica needed to unite with bases present.} \\ 11.34\% & \text{of silica present in bottom coal.} \\ \hline 30.88\% & \text{of silica needed.} \end{array}$$

Performing similar calculations for the fireclay:

$$\begin{array}{rl} Fe_2O_3\ 0.567 \times 5.44 = 3.08\% & \\ CaO\ 0.543 \times 0.50 = 0.27\% & \\ Al_2O_3\ 0.886 \times 24.20 = 21.33\% & \\ MgO\ 0.747 \times 1.80 = 1.34\% & \\ \hline 26.02\% & \text{of silica needed to unite with bases present.} \\ 52.32\% & \text{of silica present in fire clay.} \\ \hline 26.30\% & \text{of silica in excess of bases.} \end{array}$$

For middleman:

$$\begin{array}{rl} Fe_2O_3\ 0.567 \times 12.64 = 7.16\% & \\ CaO\ 0.543 \times 24.21 = 13.15\% & \\ Al_2O_3\ 0.886 \times 3.82 = 6.92\% & \\ MgO\ 0.747 \times 6.93 = 5.18\% & \\ \hline 32.41\% & \text{of silica needed to unite with bases present.} \\ 28.00\% & \text{of silica present in middleman.} \\ \hline 4.41\% & \text{of silica needed.} \end{array}$$

For top coal:

$$\begin{array}{rl} Fe_2O_3\ 0.567 \times 14.80 = 8.39\% & \\ CaO\ 0.543 \times 24.40 = 13.24\% & \\ Al_2O_3\ 0.886 \times 11.26 = 9.97\% & \\ MgO\ 0.747 \times 4.60 = 3.43\% & \\ \hline 35.03\% & \text{of silica needed to unite with bases present.} \\ 20.40\% & \text{of silica present.} \\ \hline 14.63\% & \text{of silica needed.} \end{array}$$

For rash:

$$\begin{array}{rl} Fe_2O_3\ 0.567 \times 3.20 = 1.81\% & \\ CaO\ 0.543 \times 0.65 = 0.35\% & \\ Al_2O_3\ 0.886 \times 30.24 = 26.79\% & \\ MgO\ 0.747 \times 0.63 = 0.47\% & \\ \hline 29.72\% & \text{of silica needed to unite with bases present.} \\ 60.42\% & \text{of silica present in rash.} \\ \hline 30.70\% & \text{of silica in excess of bases.} \end{array}$$

By referring to the above calculations, it will be found there is an excessive amount of bases in all but the fireclay and rash, each of which shows silica to be largely in excess, and which would combine with the excess of bases in the bottom coal, middleman and top coal. The chemist also notes that in the analysis of the ash with a simple laboratory blast lamp, all but the rash were fusible.

A summation of the percentages of silica needed to convert all the basic oxides present in the top coal, middleman and bottom coal to a monosilicate slag gives us 49.92 per cent. Likewise we find a total of 57.18 per cent. of silica in excess of that required to convert the basic oxides in the fireclay and rash. Subtracting, we find we have 7.08 per cent. silica in excess of what is needed. This amount of silica in excess need not be considered as it would be removed in the preparation of the coal by washing.

I desire to state here that while this coal did not give satisfaction on locomotives that it did give excellent results as a power-house fuel, the reason, no doubt, being that the temperature reached in the power-house boiler, where it is now being used, is not near as high as that attained under maximum working conditions on a locomotive.

POWER DEPARTMENT

Electricity vs. Steam for Winches

By W. H. Easton

SYNOPSIS—Exact comparative data of steam and electric donkey engines or winches are difficult to secure. This article describes the results obtained by removing the piston rods and gearing a motor to the crank disk of an engine used for transferring coal from barges to a delivery bin.

⁂

One of the difficulties in proving the economy of electric power for donkey engines, winches and similar applications is due to the fact that it is seldom possible to get data on exactly parallel cases. To compare the cost of operation of a given steam hoist with that of a different, although perhaps nearly similar, electric hoist is not satisfactory, and as a matter of fact, both sides of the question have been proved from data of this kind.

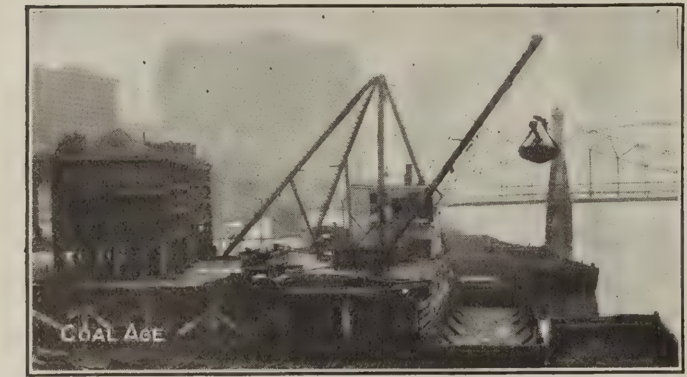

Fig. 1. General View of the Coal-Handling Plant

It is, therefore, gratifying to find a perfectly clear-cut case, where a motor has been directly substituted for a steam engine with no other change in the factors, and where the performance and the cost under both systems are easily obtainable. Such a hoist is shown in Fig. 1. As the illustration clearly shows, this device is used for taking coal from barges and loading it into a bin from which delivery wagons are supplied.

Fig. 2 shows the hoist with the old steam boiler and the new motor. The only change in the hoist was to remove the piston rods and bolt a ring gear to the crank disk, as the illustration shows. A pinion on the motor shaft meshes with this gear, so that the motor application is simple and was made without interfering with the daily operation of the hoist.

The Size and Amount of Work Done

The vertical distance from the top of the barge to the bin is 65 ft. The radius of the swing is 110 ft. and the average length of the swing is 70 ft. The weight of the bucket is 3800 lb. and its capacity is 42 bu., or 3192 lb. The average amount of coal lifted per month is 203,219 bu., or 7722 tons. The motor is a Westinghouse high-torque slip-ring induction machine of 75 hp. capacity. Central station power is used.

The cost to transfer 7722 tons with steam operation was, for coal $60, and for water $15. With electric operation, the cost for power is 1c. a ton, so that the cost for the transferring of the same tonnage would be $77.22, practically the same figure. Hence, electric power is certainly not prohibitively expensive.

Other items must, however, be considered as well as the cost. For the steam engine a licensed engineer is required, whose wages are $125 a month, but a man can be obtained to operate the electric hoist with perfect satisfaction for $75 a month.

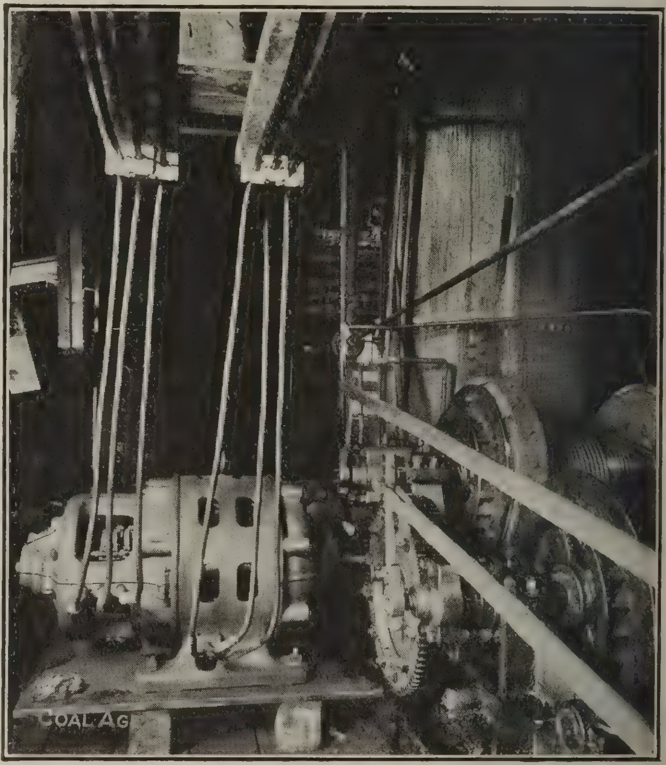

Fig. 2. The Motor Is Geared Direct to the Crank Disk

Furthermore, the steam hoist required 60 sec. to make each trip, whereas the electric hoist, because it can be accelerated more rapidly, can make a trip in 50 sec.—a 20 per cent. increase in production. Hence, for a full 10-hr. day, the electric hoist can make 120 more trips than the steam hoist and can transfer 5040 more bushels of coal.

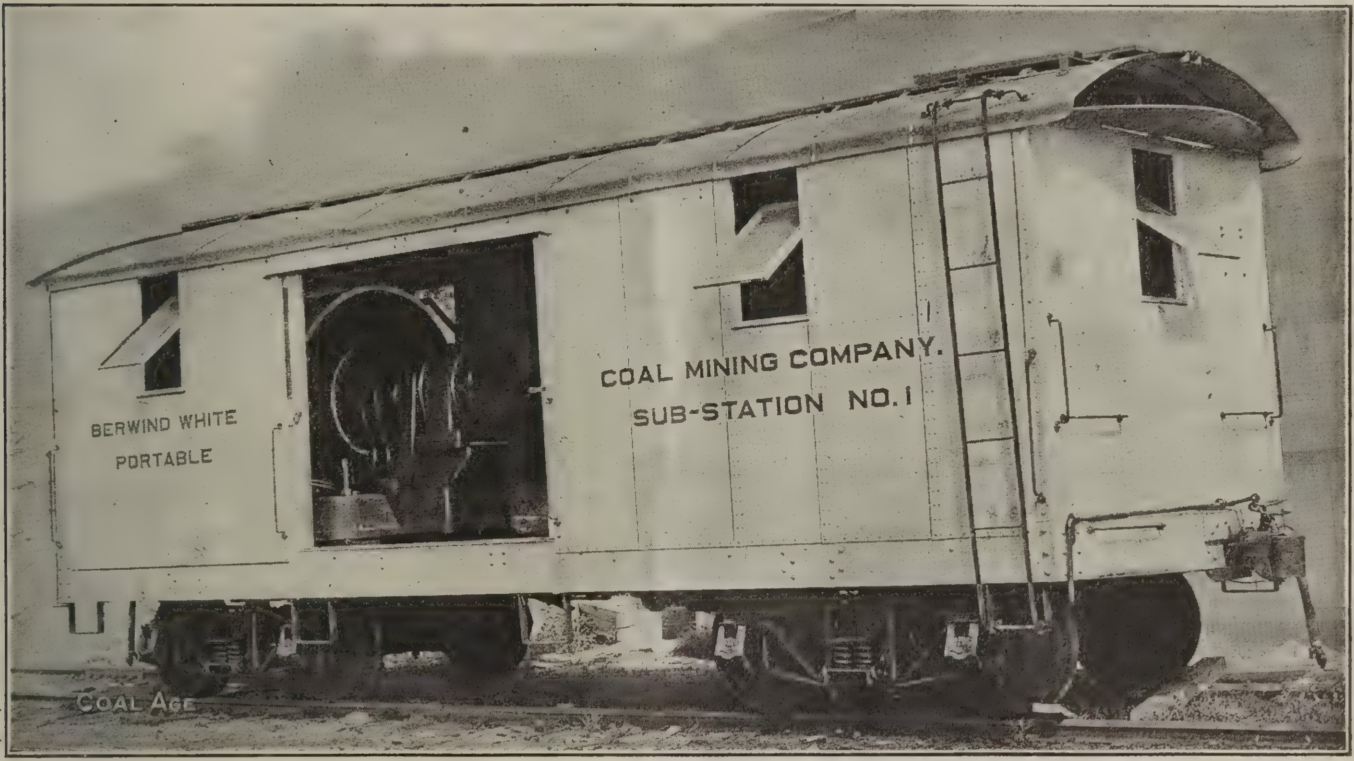
The motor is more reliable than the engine, requires little oil and no water, is always ready to operate without waiting for steam to come up to pressure, requires no attention when not in use, and has nothing to freeze up. Hence with the electric hoist the cost of repairs and maintenance will be less and there will be fewer delays and shut-downs. The relative cost of electric operation will, therefore, be less and the production greater than the figures given above.

A Portable Substation

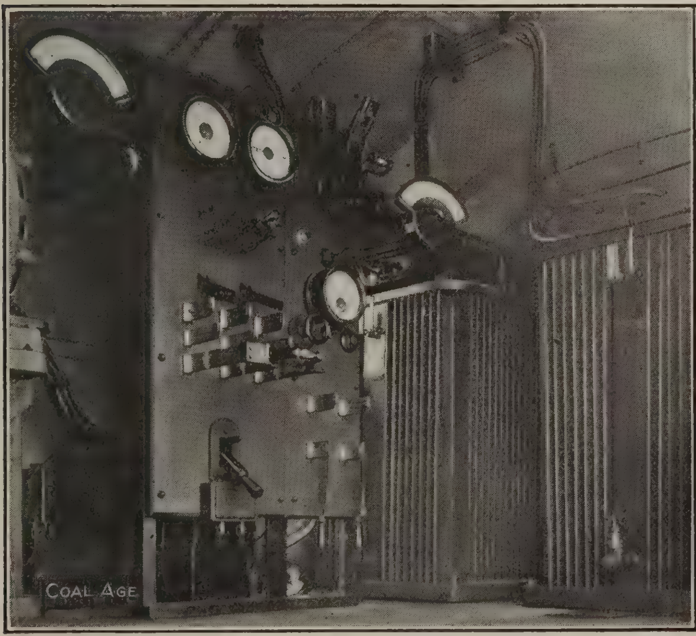
The Berwind-White Coal Mining Co., of Windber, Penn., has recently added a 400-kw. Westinghouse portable substation to its equipment, and is making an interesting use of the same.

As is well known, a substation consists of apparatus for changing alternating current into direct current and is generally necessary in mining work, because direct current must be used for haulage but cannot be transmitted economically over long distances. Hence, when the mine is located at a point remote from the power station, from which it draws its supply, the electric energy can be transmitted efficiently only as alternating current at high voltage, and then converted into direct current at the substation for use underground.

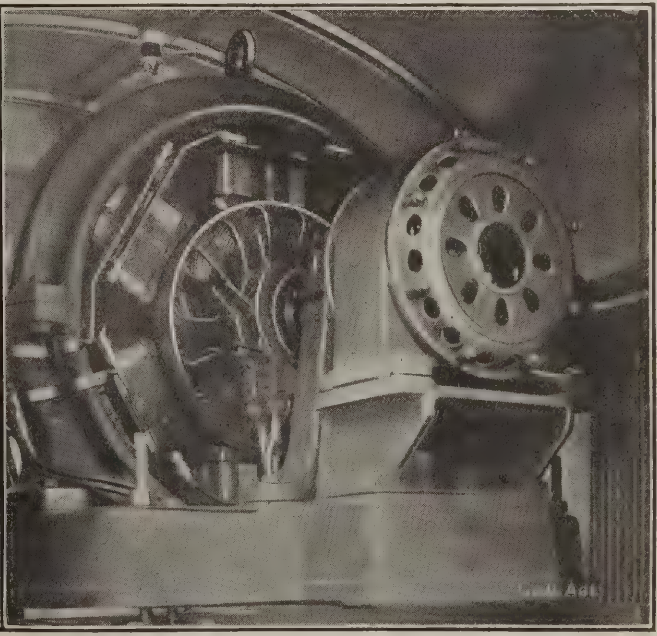
The Berwind-White Co. is developing its outlying properties at a rapid rate and needs direct current at points where permanent substations have not yet been erected. The portable substation was therefore decided upon in order to prevent delays in development. This substation has the same equipment as that of a permanent installation, namely, transformers to step down to a moderate voltage the high potential of the current received from the transmission line, a switchboard and a rotary converter, which receives alternating current and delivers



The Portable Substation on a Sidetrack



The Transformers and Switchboard



The Rotary Converter

direct current. This apparatus is all mounted in a car resembling an ordinary freight car.

The Portable Substation in Use

When work at a new development reaches the point where direct current is necessary, the portable substation is hauled to the workings, connected to the transmission line and put in operation generating the necessary direct current. When the permanent substation is completed, the portable one becomes unecessary and is taken to the next development.

A further use for this substation is to provide insurance against shutdowns. If accidents occur at any of the permanent substations, the portable one is sent to carry the load until the necessary repairs are completed. One substation of this character, therefore, is practically the equivalent of a duplicate set of apparatus at each permanent installation.

⁂

Use of Gasoline Motors in Mines

By W. C. Whitcomb*

SYNOPSIS—An elementary article on the gasoline motor, showing how to compute the size of the locomotive, the weight of the rail and the velocity of the air current in which it should work. The author says that some expert inspection should be provided and urges that gasoline haulage is not unsafe if proper precautions are taken.

⁂

It must be some 12 or more years ago that the St. Bernard Mining Co. tried out a gasoline motor built by a man named Prouty. This machine was crude and was not a success. Other attempts to produce a workable locomotive were made in West Virginia, Pennsylvania and Illinois; none of which were permanently successful.

There is nothing mysterious or uncertain in regard to the use of gasoline motors in mines. The problems to be considered are the same as those presented by any mechanical system of haulage which depends on the tractive resistance of the rail for its hauling capacity. First: The local conditions should be thoroughly studied and profiles should be made of the haulage ways, showing grades, etc. The number of tons to be handled per day and hour should be carefully ascertained, the length of haul measured, the time required to make a return trip carefully estimated and from these data the number of cars it is necessary to handle per trip can be decided. Then we can ascertain the total weight of trip, figuring in the weight of both car and load and check the profiles to see what the grades are both in favor of and against the loads and empty trip. Then we decide on a motor with enough weight and power to handle the trip against the grades with a liberal margin of reserve.

Car Friction and Gravity Resistance

Ordinary mine cars will require from 30 to 40 lb. pull per ton to move them on a level track. The horizontal tractive resistance of modern cars in good condition may drop down as low as 20 lb. per ton, but it is not safe to figure much less than 30 to 35 lb. per ton on the level. For each 1 per cent. grade against the load, 20 lb. per ton must be added. For example, if a car will move on 30 lb. per ton pull on a level, it will require 30 + 20 or 50 lb. pull against a 1 per cent. grade, or 30 + 20 + 20 or 70 lb. pull against a 2 per cent. grade.

I mention these points, as an operator is apt to say his hauls are "practically level" when he may have places with 1 or 2 per cent. grades against the loads and cannot see why his motor is not giving the results unless he has his profile and knows what he is doing.

Again, when working against grades, the pull required to move or pull the cars not only increases, but the draw-bar pull of the locomotive is less as the motor has to pull its own weight up the grades.

Draw-Bar Pull Calculated as One-Fifth Weight of Motor

I ordinarily figure that a motor will exert a draw-bar pull equal to one-fifth its weight in pounds when working on a level and on dry rail of proper weight for the motor, but from this draw-bar pull exerted on a level we deduct 1 per cent. of the weight of the motor in pounds for each 1 per cent. grade. For example, a 5-ton motor will exert a tractive effort, or draw-bar pull, on the level of one-fifth of 10,000 lb., or 2000 lb. Against a 1 per cent. grade, we would have 2000 lb. less 1 per cent. of 10,000 lb., or 2000 less 100 lb., or 1900 lb., net; or 1800 lb., net, against a 2 per cent. grade, etc. We must not assume that the hauls are "practically level," but know what the grades are and make allowance for them.

Each Rail Should Weigh 4 Lb. per Yard for Every Ton of Weight of the Locomotive

Without the use of a formula, we roughly estimate that it requires a rail that will weigh at least 4 lb. per yard for each ton of weight in the locomotive. For example, a 4-ton motor should run on a 16-lb. rail; a 5-ton on a 20-lb. rail, etc. This rail should be well laid and connected with fishplates. Low spots should be avoided. Switches should have long, easy points; curves should be as easy as possible, for the shocks and strains on a track increase about with the square of the velocity, and with mechanical haulage you not only get greater weights but higher speeds. Therefore, what might be a good track for mules is a poor track for locomotives.

These points are common to all mechanical haulage. I raise them as there is some tendency among operators to think that because a gasoline motor is a self-contained and independent unit, it is not necessary to make as much preparation for putting it in operation as with other systems of mechanical haulage, and to a certain degree, they are right, as it is not necessary to bond the rails or to line up the trolley wires with the track, etc., but good track conditions are essential to success with any system of mechanical haulage.

---

*General manager, Geo. D. Whitcomb Co., Rochelle, Ill.

Note—Article read before the Kentucky Mining Institute, Lexington, Ky., Dec. 8, 1913.

The Effect of the Gasoline Motor on the Mine Air

Much has been said about their effect on the mine ventilation and the danger of using gasoline motors. The former difficulty is easily removed. A gasoline engine will exhaust a small quantity of gas and of this discharge the most important impurity is carbon monoxide, as it is a dangerous gas, and a very small percentage in the air is injurious to the men in the mine. With an engine working properly there is little monoxide formed. The amount will vary with the quantity of gasoline consumed. There is no satisfactory or practical way of absorbing or neutralizing carbon monoxide. Carbon dioxide can be absorbed to a certain extent by lime or caustic-soda solutions and by plain water, and the objectionable odor can be taken out of the exhaust by running it through a lime solution or through water, but the only satisfactory way to make conditions safe and pleasant is to supply enough air to dilute the exhaust until it is harmless. This is not a difficult matter and in any mine with uptodate ventilation, it is already provided to a large extent by the requirements of the law, as the statutes call for a certain amount of air for each man and animal in the mine, and this volume in workings large enough to use a motor will so thoroughly dilute the gas that it will be below the danger point and so low that it cannot be detected by chemical analysis, but if more air is required, it can easily be forced through the entries.

As before stated, the percentage of exhaust gas will vary with the gasoline consumed. Therefore, you can figure on the amount of air necessary by taking the average gasoline consumption, or you can figure the maximum amount of gasoline that can be burned in the engine used on a motor. I normally figure on an engine of at least double the average horsepower used, for in starting a trip there is a heavy load and occasionally heavy grades are encountered. But where there are grades there is a heavy pull when traveling in one direction and practically none when passing over the road on the return trip; therefore, grades do not increase the average consumption to any large extent, but they do add to the quantity of fuel used for a short time.

800 to 1000 Cu.Ft. per Ton per Min.

We have found that when the consumption of gasoline is at its average, if there is from 800 to 1000 cu.ft. of air per minute per ton of weight in the motor passing through the entry where the motor is working continuously, the exhaust is not noticed and is unobjectionable. The smaller ventilating current recommended is suited for the intake and the larger for the return airway. If a motor only makes an occasional trip into an entry or working place, a small air current is sufficient, just enough to insure circulation and carry the exhaust out before the next trip of the motor, so that the exhaust will not accumulate. If you figure on the maximum gasoline consumption possible in the engine it would require about double these amounts, but as before stated, it is almost impossible to use the maximum under ordinary conditions.

For example, on our 7-ton motor, we have an engine capable of developing 50 hp. when running 500 r.p.m. On a brake test, this engine would probably burn about a pint of gasoline per horsepower per hour, that is, 50 pints or 6¼ gal. per hour. At this rate, this engine would burn 50 gal. of gasoline in an 8-hr. day, while the facts of the case are that the average gasoline consumption of this motor will run from 15 to 18 gal., showing that the average horsepower developed is from 15 to 18 hp.

The large engines, however, are more economical than smaller engines as they permit the work to be done on high gear and at slow engine speeds. You have all seen, no doubt, the same results in your automobiles. If you are running on direct drive, your gasoline consumption is low but if you get in mud and have to shift into second or third gear, your engine is running fast and the gasoline consumption increases.

Why Estimates Should Not Be Based on Full Power

I mention this point of gasoline consumption as there is a tendency to figure on what gas might be thrown off if the full power of the engine was used all the time rather than on the actual amount. It would hardly be possible to use the full power of the engine all the time, for if grades, etc., required it in one direction, there would be little or no power required in the opposite direction. For example, take a 4000-ft. haul with a heavy grade against the load all the way. To come up this inclination under normal speed would require say, 10 to 12 min. under three-fourths full power. To switch, hook onto empties, etc., would take 1 to 2 min.; to come back with the empties, 10 min.; to switch and couple to loads, 1 to 2 min. Therefore, we would have, say a total of 22 to 26 min., with 12 min. under, say ¾ full load, 3 to 4 min. under little or no load and 10 min. on return trip under ¼ load, so that even under such conditions the average would be less than ½ load.

Experience Needed for Locomotive Operation

There has been a tendency to consider gasoline motors unreliable. This has been to a certain extent true in the past, but with the present development, there is little excuse for not getting as good and consistent results with gasoline motors as with any other system. However, a gasoline motor will not run itself nor can it be put into the hands of an inexperienced man and be run indefinitely without care or attention.

Gasoline-driven machines have received a great deal of unjust criticism and blame due to the fact that they can be placed in the hands of an inexperienced man after a few hours' instruction and he can operate them. We see automobiles, auto-trucks, etc., not to mention gasoline mine motors, operated by men who know but little about the mechanical construction of these machines or their requirements. They know how to charge them with gasoline, how to oil them and how to turn the crank to start them, but nothing further. This is all right if there is someone back of them to examine the locomotives occasionally and to see that they are kept in order. But very often, especially with mine motors, because they are self-contained and independent, such a man is left to run and care for the machine and while often he is willing and anxious enough to give satisfaction, yet due to his lack of experience he is unable to do himself or the machine justice.

If an electric plant is installed, it requires an engineer, an electrician and a wireman, all in addition to the motorman. A compressed-air plant needs an engineer and a pipeman, as well as a compressed-air locomotive engineer. Hence why should not provision be made for the inspection and care of gasoline motors by someone other than the motorman? Inspection is not required every day but the old adage, "a stitch in time saves nine," applies to gasoline motors. They will probably run for months demanding little or no attention other than to put in gasoline, oil and water and tighten up a bolt or nut occasionally, but they will sooner or later require attention. The same is true of a boiler, engine, generator, compressor or any other machine performing a large amount of work, such as a gasoline locomotive does, but the conditions under which the latter works are more adverse. Where systematic care and attention are given, gasoline haulage is just as reliable as any other system.

Safety from Explosion

Many operators fear to use gasoline in mines. This fear is well founded unless proper precautions are taken. We have so designed our motors that the tanks cannot be filled when on the locomotive, yet can be sealed or closed when off the motor. Handles are provided for carrying the tanks and the weight of a tank, is such that one man can carry it. Four tanks are furnished, two to be carried on the machine and two to be sent outside the mine.

Either tank can be used separately for running the engine, so that the operator can use up one tank, switch over to the other, send the empty tank up and have a full one come down, which he could pick up on the next trip, and always have a reserve tank on the machine and two reserve tanks on the surface. These tanks should be filled at an oil station away from the shaft or tipple, so that the gasoline is handled around the tipple and below ground in sealed tanks exclusively.

They are so placed on the motor that they are protected on all sides by heavy iron covers. By this system, danger is eliminated. Between each tank and the engine are two shut-off valves so that in case of an accident, the gasoline can be shut off at two different points for each tank. This system has worked out very satisfactorily, and although there are over three hundred of our motors in use, we have not had any trouble from this source.

Ignition of Gas or Coal Dust

So far as igniting gas or coal dust, I think there is no question but what gasoline motors are much safer than electric motors as the exhaust from a gasoline motor passes through a large muffler or cooling box and is finally discharged near the ground while the electric motor is apt to give off sparks or electric flames either at the track or at the trolley wire near the roof where gas would accumulate.

Gasoline motors have only been used in mines in a practical way during the last four years. Great improvements have been made and more will naturally follow, but today, with equal conditions and care, the gasoline motor will undoubtedly give as cheap, if not cheaper results with less cost of installation than any other system and is the most flexible haulage which can be installed, as all that is required in making extensions is to put the track in shape. When not in use the gasoline motor can be put on one side in a dry motor stall and will not require care or feed and when ready to start it is not necessary to see that boiler, engine, trolley wires, rail bonds, pipe lines, etc., are also ready. The gasoline motor has taken its place in mine haulage and as it is better understood it will be more appreciated.

The Storage of Anthracite Coal

The storage of anthracite coal is a subject of which the public knows little and indeed on which accurate information is not easily obtainable. The fact that storage is a source of considerable expense to the operating companies is also a matter of which most persons are entirely ignorant. An authority on the subject estimates the amount that may be in storage at one time at about 10 per cent. of a year's marketable production, or say 7,000,000 tons, at tidewater and interior points. At the present time coal in storage is about at the maximum.

One coal company has storage facilities with a capacity of 2,000,000 tons. At one of its plants provision is made for 480,000 tons, at another for 383,000 tons. More than 125,000 tons can be stored at a covered plant in South Chicago. The Schuylkill Haven yard of the Philadelphia & Reading Coal & Iron Co., has a capacity of 1,000,000 tons, and that at Abrams a capacity of 600,000 tons. This stored coal must be hoisted, when needed, out of the Mahanoy Valley over Broad Mountain. The pair of hoisting engines installed for this purpose could hoist three "battleships" and will develop 5000 hp. while doing it.

The expense in storage involves not only the cost of handling the coal several times, but the loss that results from breakage, which is the chief care of the employees in charge of this branch of the anthracite-coal business. There is also a considerable investment in hoisting machinery. In addition, the huge conical piles of coal are subject to freezing, and when they get in that condition the only way the coal can be handled is to break it up by pick and shovel gangs, which is not only expensive work, but damages a good deal of coal.—*Philadelphia News Bureau.*

⁂

Copying Old Blueprints

A writer in the *American Machinist* has the following to say regarding a method for rehabilitating old blueprints:

> There is often trouble, in drawing offices, in having some old blueprint record creased and hardly decipherable. To work from it is not advisable for it might become torn and made even more indistinct than it is at present. The draftsman cannot trace it because the lines are too indistinct to look at through the tracing cloth and redrawing it would be a rather costly item.
>
> I had an instance of this recently where an individual brought me an ancient blueprint, the only record, and desired me to duplicate it. After a little experimenting with another blueprint, I found that if the white lines on the print were inked over, a very presentable blueprint could be obtained from exposing this as one would a tracing. So I went ahead and inked over the white lines on the old blueprint with india ink. This, as you can imagine, was very much easier than tracing it. When this was finished, I placed the print in the printing frame and obtained several blueprints from it as if from a tracing.

⁂

Erratum

In Fig. 5, on p. 851, of our Dec. 6 issue, to the left of the figure, the words occur: "A grounded armature is found, lamps out." This should read: "A grounded armature is found, lamps light."

⁂

A fireboss who was going up over a roll, and who had tested the face of a crosscut with his safety lamp, called down to the workmen waiting below with naked lights: "There's a bit of gas here, so don't youse all come up; only one of youse come up here with a light."

EDITORIALS

The Source of Public Scientific Conceptions

In the earlier days of the rescue apparatus, the question was often raised whether breathing pure oxygen was not dangerous to life. The prevalence of this idea in official and other quarters led Prof. Gustav Gärtner, as he tells us in the "Dräeger Hefte," to investigate its authority.

Extensive search in scientific textbooks failed to elicit such an opinion, barring the fact that oxygen was shown to be dangerous if it exceeded the pressure of two atmospheres. At least Prof. Gärtner heard the same opinion advanced by his young nephew and demanded the source of his information. "I have read it in a romance of Jules Verne," answered the boy. "Twenty Thousand Leagues under the Sea" was the lad's authority, and also, as investigation showed, this same book had created in him many other notions.

Verne represents that oxygen breathing intensifies, but shortens life like the burning of a candle. It is the same scientific treatise which, if distant recollections may be trusted, represents that a submarine boat can be run on current generated in Bunsen batteries. Few, doubtless, of the many who have read this and other works by the same writer have ever doubted the accuracy of the information contained therein. Many popular ideas have originated in just such an unreliable manner.

A Discrepancy in Coke Statistics

For a great many years the statistics of Connellsville coke, compiled weekly by the *Connellsville Courier*, have been accepted in the coke and iron trades as worthy of serious consideration. Reflecting on Disraeli's remarks regarding the three kinds of inveracity, of which statistics is one, we are disposed to apply such checks as may appear likely to disclose possible irregularities.

The *Courier* presents weekly two sets of figures, one of coke production in the Connellsville and lower Connellsville regions, and the other of shipments from those regions. Normally the divergences between the two are slight, as certainly they should be, for it is quite unusual to stock coke at the ovens. The extra handling is expensive and damages the coke to such an extent that buyers usually object to receiving stock coke except in emergencies. As a rule, too, it is unecessary, for the production of an oven can be regulated to a certain extent by varying the number of charges in the week.

Observing a tendency in the past few months for the reported shipments to outrun the production, we took pains to add up the respective figures as reported since July 1 to date, in the 24 weekly reports, and find that the shipments exceed the production by more than 65 thousand tons. Assuming that the statistics are precisely accurate, and that the region is entirely bare of stocks now, it is apparent that there must have been some 65,000 tons in stock on July 1. At that very time, however, it was claimed that the operators were being careful not to accumulate stocks, but rather to restrict production to the absolute limit of demand.

"What It Is—What It Does

The words above are quoted from a caption in the reply of the United Mine Workers of America to the statement of the coal operators of Colorado. We shall not copy here all the good works accredited to union activity but note only two of those presented. The circular states that: "The union has made life safer in the mines so that the death rate in unorganized workings is three times greater than in those where the union is recognized. It has been the greatest power in the country in preventing strikes in the coal mines. Wyoming, for instance, has had no strike since it became organized. The coal miners and operators deal with each other in peace and harmony."

We have always been advocates of the right of the miner to form a union and have never been blind to the advantages which might accrue to operators, miners and the public from such an organization, and we are glad to see that the union is boasting that such results have been already accomplished. The statement quoted shows that the leaders in that movement believe that the union *should* secure safety and promote industrial peace.

Of course, the organization should do even more, it should guarantee excellence of work and efficiency and it should lead in promoting domestic comfort and high ideals of citizenship among its members. But after reading the quotation above, we cannot refrain from congratulating the union on having a clear comprehension of a part, if only a part, of its duty to the men, the operators and the nation.

But we can only write these words of commendation by being utterly blind to the wilfulness with which the United Mine Workers of America have misrepresented the real facts while they rightly define their proper mission which they have left unfulfilled.

There are so many states in which the union is weak in some parts and strong in others that a comparison based on an estimate of states as a whole would give unreliable results and it would besides overlook the inherent dangers of mining in various localities, thus defeating any attempt to draw a correct inference from statistics.

But we are certainly safe when we make the declaration that the United Mine Workers of America have opposed themselves to the safe conduct of mines. The organization has, it is true, aided in passing laws involving expense and trouble to the operator, but on the other hand it has repeatedly sought legislation which permitted the shooting of coal from the solid and only in nonunion states are convictions obtained against miners for violation of the laws of safety. Its strong opposition to all attempts to discharge violators of safety rules has led to repeated accidents. In fact, the union, like other *ex-parte* bodies, works for the reform of the other fellow and labors equally hard to maintain such evils as make it popular with its supporters. It has been equally active in the seeking and the nullifying of legislation; so perhaps its virtues and failings on the whole counter-balance.

As for promoting industrial peace, it has never done this. Its existence involves a strike or a suspension every year or so when the schedules are rearranged. We consider it, therefore, rather a guarantee of industrial war than as a pledge of peace. But if it would only keep its agreements in between these periods of rearrangement, it might claim to prevent some minor labor troubles but unfortunately its contracts are not kept. The Anthracite Conciliation Board, after noting some two or three hundred strikes in the anthracite region made by union men to obtain privileges which their contract did not give them, instructed one operator to discharge three of his labor leaders. The operators of central Pennsylvania in a meeting called at Philadelphia for that special purpose, have served notice on the miners that they will withdraw their recognition from the union, if that body does not cease its unwarranted strikes to obtain ends other than those provided by the contract, which both parties have signed. These two facts will show how little is to be gained by agreements with the union as now constituted.

It is said that a standing army insures peace, but most of the warriors of the United Mine Workers of America are only paid by that organization in times of war or disagreement and when everybody is working peacefully the occupation of the pit committee is gone. So this body seeks an occasion for a quarrel and sedulously endeavors to make a *new* contract as the operator obstinately refuses to give them an excuse for trouble by breaking the one he has signed.

But these are not essential parts of union activity. If the organization were in other hands we believe it would not necessarily be useless to its members, the operators and the public. Some changes could be made which would insure a greater degree of peace. The meddlesome pit committee which is an unutterable nuisance should be abolished. It is paid only when it gives trouble and, if at all venal, it can arrange to annoy the operator all the time. Under stricter supervision by the paid officers, the local committee could be made at least cognizant of its duty even if the policy of the union did not permit of its entire suppression. There should be no countenance given by the union to strikes other than those which are declared for the purpose of enforcing agreements, and suspension from the union should follow all unauthorized striking. As the operators but rarely seek to evade their contracts, there would be almost no occasion for strikes or suspensions.

The union should show itself as much interested in aiding all good movements as that local union at Gillespie, the good deeds of which will be found set forth in our sociological department of this week. A few years ago the business man did not regard safety provisions as incumbent on him. He thought that his duty was done when he avoided using dangerous devices and kept his machinery in condition. Today he lays his plans for safety with consummate care. The union, however, is just as callous today as the operator was in years gone by. A few years ago the propaganda of safety was regarded as none of the business of the industry. It is now thought to be none of the business of the union, but we venture to think it will eventually be regarded as a leading obligation. Even the organization cannot safely oppose itself permanently to the spirit of the age and to the needs of its members. The fact that it loudly proclaims that it is moving in that direction gives us hope that we shall in time be able to see evidence of its progress.

⁂

The Mine Foreman Certificate

Complaints reach us, from time to time to the effect that many mine foremen holding positions of responsibility with certain coal companies have failed to comply with the requirements of the state mining law, in regard to the certification of mine foremen. In some cases, it is claimed that the man holding such a position does not even possess the certificate required by law; but, more frequently, the claim is made that the certificate was secured through improper means. Occasionally it is stated that the man holding the certificate has not taken out his naturalization papers and is not, therefore, a citizen of this country or eligible to the position of mine foreman.

There is nothing more discouraging to the man who is the honest possessor of a certificate entitling him to hold a position as mine foreman, than to know that present incumbents of the office he desires have no certificates, or have obtained their certificates through dishonest means and are not legally entitled to the same.

We know that, in many cases, state mining boards have attempted a more or less thorough investigation to ascertain, if possible, what certificates are wrongfully held. We have known of cases, in the past, where the mine inspector has notified the coal company that a mine foreman in their employ must secure his certificate by a certain date or give up his place. In some few cases, a mine foreman of long experience and acquaintance with the mine of which he has charge has been permitted to continue to serve in that capacity for a stated time, which would enable him to prepare himself to pass an examination and secure a certificate as required by law.

In some states, the mining law provides for what is termed a "service certificate," which makes it legal for a man to continue to serve the same company, in the same capacity, as long as his service is satisfactory. The service certificate was provided to avoid the possibility of a law requiring certification, proving a hardship and an unjust burden on the man who had served successfully for a number of years in his present position. The time has largely passed now, in most states requiring the certification of mine foreman, when such a law will work a burden on men holding that position. The fact is generally recognized that it is not only desirable, but absolutely essential that all mine foremen should be men possessing not only practical experience, but theoretical knowledge of the principles of mining.

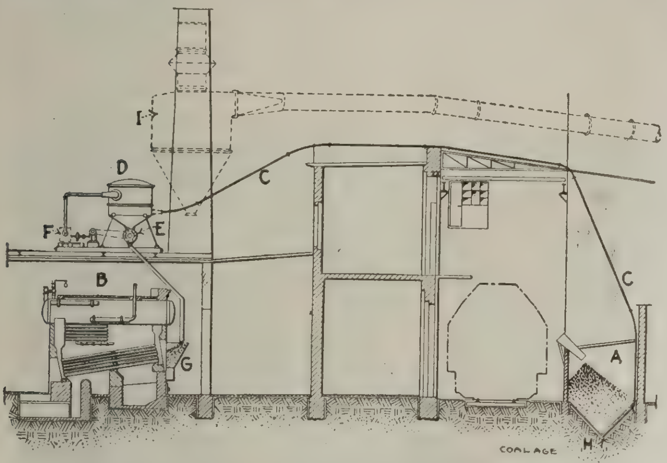
Coal Age would not assume to impugn the honesty of any member of an examining board; but there is unquestionably grave doubt as to the thoroughness of many examinations to determine the competency of candidates for the position of mine foreman. Mine examining boards are strongly urged to consider the growing need of a fuller knowledge of theory and principles in mining, on the part of candidates, for all positions of trust and responsibility. Let everything possible be done to raise the standard and increase the efficiency in this department of the work. In this way only will the certificate of competency continue to be of value.

Pneumatic Plant for Transporting Coal

The pneumatic transportation system employs directly exhausted power or compressed air (or both successively) to convey the material in tightly closed tubes; it has been used for about 15 years,* for moving valuable raw materials, such as grain, malt and chemicals. In spite of its three- or four-fold power consumption, it had the advantage of saving losses in dust of the product.

The pneumatic transportation of low-grade materials, such as sand, coal slag, ash and refuse, has recently begun to assume economic importance. The process has been considerably improved and coal up to nut size is now handled; and especially the dangerous coal dust may be conveyed safely and without economic disadvantage.

The plant here described transports nut coal to the boiler house with entire satisfaction. It was built by Simon, Buhler & Baumann, Frankfort on the Main, for their own use.



Sketch Showing General Arrangement

As shown by the illustration, the coal shed *A* is at some distance from the boiler house *B*. The transportation of the nut coal in hand trucks or barrows across the shipping track was inconvenient, owing chiefly to blockage of the way by freight cars. The pneumatic system avoids this difficulty. A pipe *C* was run from the coal shed over the railroad track, and storage building directly to the place of use. Above the boiler house is the vacuum receiver *D* with discharging device *E* and an electrically driven air pump *F*, so that the coal is brought directly into the hopper *G* in front of the automatic stoker. By means of the motor starter, the fireman in the boiler house can start or stop the transportation.

Since the coal is bulky, the suction mouthpiece *H* in the shed cannot automatically suck it up as in the case of grain and other granular material, but a special arrangement must be employed which enables a completely automatic service. In the transportation tube the coal moves with considerable velocity, and when passing curves, rubs on the tube walls. Curves are, therefore, to be avoided so far as possible, and where indispensable they should be gentle ones. At the entry into the vacuum receiver care should be taken that coal drops upon coal, since otherwise it breaks up into dust and becomes unsuitable for grate firing. Discharge tube and chute must be as short as possible.

The coal collecting in the vacuum receiver *D* sinks through a steep funnel bottom to the discharging device *E*, which cuts it off from the vacuum. It consists of a cell wheel turning at about 10 r.p.m., and emptying the coal in small quantities. The coal dust forming in the receiver is caught on screens and by shaking with a hand lever the coal is resized.

For large plants a wet filter is recommended, that is, a reservoir filled with water to a certain height. The air containing coal dust is sucked through and thus cleaned. The slime thus produced is drawn off into certain chambers, dried and briquetted.

The furnace can also be fed automatically by a chip or sawdust-conveying plant *I* of about the same power. The movement of the air is produced in the plant described by a rotary blower *F*, belted to a 6-hp. electric motor. The quantity of coal conveyed is about 6½ cu.yd. per hour. The force of the air current, even at a speed of 65 to 100 ft. per sec., is so great that chains and electric-lighting fixtures from grain ships are sucked up. Velocities up to 150 and 200 ft. per sec. have been reached in pneumatic transportation plants.

---

*Much longer in the United States.

Recent Legal Decisions

By A. L. H. STREET*

Miner's Lunch Place as Place of Employment—A coal miner while eating lunch in the mine within 4 ft. of his place of work was acting within the scope of his employment, so as to charge his employer with liability for injuries resulting from a fall of rock from the roof. (Indiana Appellate Court, Domestic Block Coal Co. vs. Holden, 103 Northeastern Reporter, 73.)

Nondelegable Character of Employer's Duty—An employer cannot avoid responsibility for injury to a worker, arising from failure to provide a reasonably safe place of work, by delegating performance of such duty to some particular employee. (Oklahoma Supreme Court, Great Western Coal & Coke Co. vs. Malone, 136 Pacific Reporter, 403.)

Scope of Coal Mining Co.'s Powers—Charter power given a corporation to engage in mining, coking and selling coke and coal impliedly includes authority to own and hold such real estate as is reasonably necessary in conducting its general business. The company is, therefore, empowered to own and hold the surface of land in order to mine coal underneath, and may utilize the surface for agricultural purposes, as an incident of ownership, subject to the right of the state to compel the corporation to dispose of any land not held or used for corporate purposes. One who has wrongfully injured the land by overflowing it cannot assert that ownership of the property was beyond the power of the company, for the purpose of avoiding liability for the damage done. (Illinois Supreme Court, La Salle County Carbon Coal Co. vs. Sanitary District of Chicago, 103 Northeastern Reporter, 175.)

Operation of Illinois Mines Act.—The Illinois mines and miners act requires coal operators to maintain competent shaftsmen at the bottom of each shaft to preserve order and to enforce regulations governing the carriage of men on cages and to keep the shaft lighted. Held, that in a suit by a miner for personal injury, based on his employer's violation of this statute, it is no defense that the miner was guilty of negligence contributing to the accident, or that negligence of a third person concurred to produce the injury, but it must appear that the employer's violation of the law was a direct cause of the accident. A miner does not become a trespasser, so as to lose the benefit of the statute, by entering a shaft before he is required to do so in the performance of his duties, if he enters at a time when a shaftsman should be on duty. Since the purpose of the law is to protect all coal miners, the operator owes the same duty to a miner employed on a night shift, who does not go to work until after the day shift has left and the coal has been hoisted, as is owed to day workers. (Illinois Supreme Court, Brunnworth vs. Kerens-Donnewald Coal Co., 103 Northeastern Reporter, 178.)

SOCIOLOGICAL DEPARTMENT

An Illinois First-Aid Meet

SYNOPSIS—A rescue meet in which the labor union joins with a coal company in offering prizes and directing the events.

⁂

The Superior Coal Co., of Gillespie, Ill., has three of the largest coal mines in the state. The No. 3 mine has a record of 4748 tons hoisted in an 8-hr. shift and the 3 mines often produce 12,000 tons in one day.

The Superior mines are officered wholly by progressive young men and are with the leaders in any work which will make coal mining safer and more efficient. From the beginning of the safety movement they have been warm advocates and supporters of the mine-rescue and first-aid development.

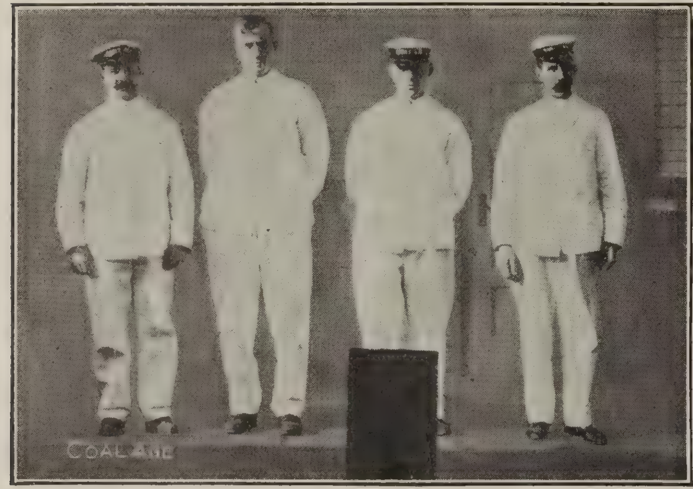
A room has been fitted at the general offices, with Draeger and Fluess rescue helmets and first-aid and mine-rescue equipment. A pulmotor with charged oxygen cylinder is always ready for use in the mines or in the town. Last fall the first of a series of annual field days was held in Gillespie and the Superior Coal Co. presented a beautiful trophy as first prize.

The company is a subsidiary of the Chicago & Northwestern Ry. Co., its mines being located on the Southern Illinois division of that road which has just been completed. On Nov. 18, 1913, President W. A. Gardner, of that railway, who is also president of the Superior Coal Co., made an inspection of the new division and, as he had always been interested in the first-aid movement, it was decided to demonstrate to him and the directors what progress had been made, and an exhibition was given despite the fact that the annual meet was approaching, being scheduled for Dec. 9.

The Mine-Rescue Exhibition

The exhibition was furnished by the first-aid team (Champion No. 1) of the Superior Coal Co., which won the trophy presented by that corporation at the State Fair, on Oct. 10, 1913. It consists of miners from mines Nos. 1 and 2. All the members hold Red Cross certificates. The captain is J. Weir, his subordinates being J. Struthers, C. Miller, J. Couden and W. Wood.

The rescue team was headed by John K. Fraser, assistant mine manager at No. 2 mine who was a captain of one of the rescue teams at the Cherry disaster. The other members were W. Lyons, assistant mine manager at No. 1 mine, J. McMillen, assistant mine manager at No. 3, D. D. Wilcox, assistant chief engineer, and A. W. Carroll, mining engineer at No. 2.



Winners of Superior Coal Co.'s Loving Cup

First-Aid Team, Saline Coal Co., Harrisburg, Ill.

The drawing shows the transformation whereby the carpenter shop at No. 3 mine was made to look like a room off an entry. It was assumed that an explosion had taken place in the mine. As soon as it occurred, the rescue squad was called to the office and was met by Assistant Superintendent Shanahan, who as mine manager told the squad what had happened. On arriving at the mine, they were told that checks 301 and 302 were still on the board and that Jones and Smith were, therefore, still below. The helmets were examined and put on immediately and the squad in charge of John Fraser, the captain, started into the mine.

The men carried Wolf and electric safety lamps and made tests for gas as they proceeded. The room was filled with smoke (sulphur and formaldehyde being used to produce the required effect) and a man, a dummy, was found at the point marked on the drawing. The dummy was carried out and on reaching the surface, the first-aid men received the body and substituting a live person performed resuscitatory work on him with the pulmotor with the help of J. Boston, safety inspector.

The rescue teams then reëntered the mine in search of Smith and found his cap and lamp near a fall of slate.

THE GILLESPIE PIPERS, COMPOSED OF MINERS WORKING IN THE SUPERIOR COAL CO.'S MINES

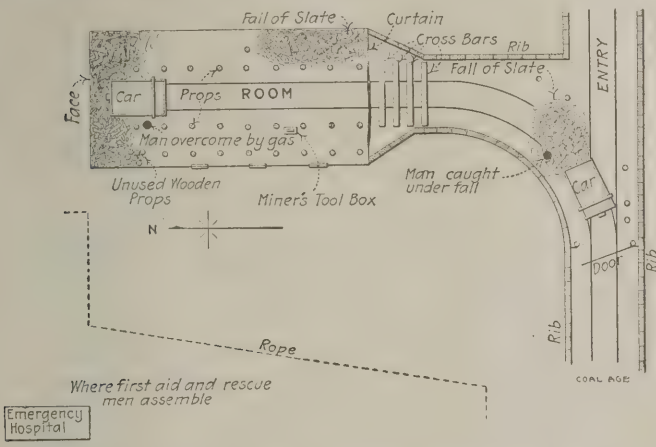
CUBA TEAM USING THE LUNGMOTOR FOR RESUSCITATION WITHOUT AN OXYGEN CYLINDER

A messenger was sent out to get the first-aid men and ventilation being reëstablished they entered the room and removed the patient on a stretcher, the rescue men meanwhile having lifted the slate fall from his prostrate body.

The victim was treated for the following injuries: a scalp wound, lacerated left shoulder, compound fracture of the right forearm, fractured right leg and shock sufficient to render him unconscious.

THE FIRST-AID CONTEST

A first-aid contest was held on Dec. 9, in the Colonial theater in Gillespie, and four towns were represented in the competition, namely, Cuba, Breeze, Harrisburg and Gillespie. The contests opened at 9 a.m. with music on the main street by the local band. D. D. Wilcox, assistant mining engineer of the Superior Coal Co., acted as chairman and called the convention to order.



RESCUE GALLERY AT NO. 3 MINE, SUPERIOR COAL CO.

John Ross, superintendent of the Superior Coal Co., addressed the meeting and expressed his regrets that General Superintendent John P. Reese could not be present as he had been obliged to go to Iowa to attend an important meeting of the operators of that state held to consider the new contract with the miners to be made Apr. 1, 1914.

ALL LOCAL AUTHORITIES REPRESENTED

The Methodist preacher, Rev. Spragg, Frank Hoehn, the superintendent of the Gillespie schools, James Taylor, the state mine inspector and Thomas Downie, president of local No. 730, were the speakers. The reader will do well to examine this list of speech-makers because only by combining all the forces mentioned can a successful campaign for safety be commenced. Mr. Downie explained that the local of which he was president appreciated the movement and had donated money to its support.

The Superior Coal Co. has always realized that success in first-aid work depends on the interest that the employees take in their efforts and the officials understand that the utmost they can do is to encourage and assist, for the real execution lies with the miner himself.

The judges in the contest were A. F. Knoefel, surgeon for the Vandalia Coal Co. and first vice-president of the American Mine Safety Association, Dr. George A. Clotfelter, of Hillsboro, and Dr. Hopkins, of Chicago, chief surgeon of the Chicago & Northwestern Ry.

THE EVENTS

The first problem in the first-aid contest was a one-man event in which 6 men competed.

> Two men are entering a mine on an electric locomotive. The trolley wire is down and knocks the trip rider from the motor. The accident happens at a dip where the water has been allowed to accumulate. The trip rider falls under the motor sustaining a fractured thigh and a cut in the groin. The wire when it fell on him gave him a severe shock.

Fullerton Fulton, of Gillespie, received first prize, Bert Peeck, of Harrisburg, second, and Thomas Trigg, of Cuba, third.

In the afternoon, the Gillespie Pipe Band gave a selection after which nine teams competed in the following two-man event:

> Two men cutting coal in a room fail to set a prop close to the face. One who is shoveling slack is caught by a fall of slate and coal. The driver comes by and the uninjured man calls on him for assistance. The nature of the injury sustained is a compound fracture of both bones of the left leg just above the ankle, calf badly lacerated, severe hemorrhage, right ear also badly lacerated and an incised wound on left temple.

James Struthers and James Weir, of Gillespie, won first prize and Charles Miller and John Cowden of same place took second.

OSCAR CARTLIDGE AND THOMAS ENGLISH

The next contest was a full-team event.

There has been an explosion in a mine and a driver has been injured in the following manner: Fracture of left arm and elbow, fracture on right side of chest, including seventh, eighth and ninth ribs, fracture of pelvis at middle line in front. Patient unconscious. Adopt the proper treatment and carry the patient 20 ft. on a stretcher.

There were five teams competing. The Cuba team took first prize, Gillespie team No. 2 second prize and Breeze No. 4 third prize.

THE AWARDS

The following prizes were awarded for the team contest:

First Prize—Superior Coal Co.'s trophy for one year with names of contestants engraved. $25 cash donated by Local Union No. 730, U. M. W. of A. An American Mine Safety medal, Red Cross medal and a book entitled "Questions and Answers" were given to each participant, the latter being presented by James Taylor, state mine inspector.

Second Prize—$15 cash. A solid gold medal was presented by the Superior Coal Co., and a book on "Questions and Answers" was donated by James Taylor to each participant.

Third Prize—$10 cash. Solid silver medal presented to each participant by Superior Coal Co.

The prizes for the one-man event were as follows:

First Prize—Trophy awarded by the Superior Coal Co. $10 cash awarded by Local Union 730, U. M. W. of A. American Red Cross medal and American Safety Association medal.

Second Prize—$5 cash and a solid gold medal presented by the Superior Coal Co.

Third Prize—$3 cash and a solid silver medal presented by the Superior Coal Co.

The prizes for the two-man event were:

First Prize—One 17-jewel Waltham gold watch presented by the Superior Coal Co.'s officials to each participant.

Second Prize—One solid gold ring to each participant, given by the officials of the Superior Coal Co.

Among the visitors were Oscar Cartlidge, manager of the state rescue stations; Dave Reese, Superintendent of No. 1 mine of the Peabody Coal Co., of Kinkead, Ill.; Harm Young, district superintendent of Peabody mines, Taylorville, Ill.; Thomas English, superintendent of rescue station, Springfield, Ill., and R. Y. Williams, engineer in rescue department, Bureau of Mines.

The meeting was under the auspices of Local 730 of the United Mine Workers' Union, the American Mine Safety Association and the Superior Coal Company.

❖

Electric Installations in Gaseous Mines

By Dr. Alfred Gradenwitz*

Electricity can be used in fiery mines with complete success, provided the mine owner works hand-in-hand with the electrical engineer.

Two fundamental systems have been followed in this connection; the one is based on the principle of installing the electric motor and apparatus at such points in a fiery mine as are free from firedamp, while the other consists of developing motors and apparatus of explosion-proof design, which can be safely employed where there is real danger. Mine owners generally have been in favor of the former system, and, as far as the practice in Europe is concerned, an Austrian plant can be mentioned as a striking instance, namely, the large pumping motors installed in the fiery mines of the Karwin district, where the pump chamber, and not the motor, is protected against the entrance of firedamp. Here it was believed that the explosion-proof enclosure of large motors, such as are necessary for driving central pumping plants, was practically impossible, or, at all events inadvisable at the present state of electrical engineering.

The pump chamber, in this case, was made air tight at the water hole while the connection with the crosscut is provided with three iron doors, the two outer ones opening in one direction, while the inner one opens in the opposite direction.

In addition to electrically driven pumping plants, traction by electric locomotive is also gaining considerably in importance year by year. Two types of locomotives may be used in this connection, one a type for parts free from firedamp, and the other a type for those sections where there is danger. In the first case, locomotives with bare contact wires have been used successfully, while for the second, explosion-proof accumulator locomotives have found favor.

Of the electrically driven machinery in the mines, the hoisting winches are of special importance, as they are generally situated at the highest point in the workings and therefore in greater danger from the collection of firedamp than other machinery. The hoisting engines have therefore been placed in a current of fresh air.

Experiments made in the Gelsenkirchen-Bismark Experimental Station, with a view to the development of explosion-proof motors and apparatus have shown three forms of construction to be possible: First, total inclosure; second, laminated-plate safety-protection; third, oil protection.

The totally inclosed form assumes an explosion-proof construction from the outset and calls for such a casing of motors and apparatus as to be able to withstand the pressure of explosion in the event of any firedamp igniting in its interior.

In the laminated-plate safety-protection, the familiar principle of a Davy lamp is followed, ignition being prevented by a wire gauze which causes the gases to give up their heat as they pass through. The characteristic element of such apparatus takes the form of the packing of laminated plates fixed to the end openings of electric motors or the covers of the inclosed apparatus.

Oil protection is the third form of explosion-proof construction and is employed for motors, as a rule, solely for the protection of the slip ring. Its use enables an extremely convenient form of controlling switch and other apparatus to be adopted. Here the protection against explosion is secured by allowing the opening and closing of any live contacts to take place under oil.

Experiments made by Beyling on motors and apparatus in fiery mines have shown the necessity of testing the operation of the safety devices. The plate protection must be most carefully manufactured, its effectiveness being completely destroyed by a single fault and the same is true of the totally inclosed type, as danger exists where there are any flaws in the casing.

The testing floor erected by the Allgemeine Elektrizitäts Gesellschaft, of Berlin, for testing motors and apparatus to be used in firedamp mines consists of a cement chamber sunk below the level of the ground, which can be subdivided into a number of small compartments and is closed at the top by a paper cover which is torn when the explosion passes from the motor into the chamber. The compartment can be filled with an explosive mixture containing approximately 15 per cent of illuminating gas which, being agitated by an air pump, insures an explosive mixture in apparatus and chamber.

DISCUSSION BY READERS

Education and Training of Mining Men

Letter No. 6—It has been suggested by a recent writer, in these columns, that boys should be taken into the mines at an early age in order that they may learn the practical side of mining. While I have the greatest respect for the practical man and honor the man who has risen from the bottom to a position of responsibility, I nevertheless feel that experience should not be gained at the expense of something more valuable; and, on this account, I want to point out a few objections to the course suggested by Mr. Smith, Coal Age, Nov. 15, p. 743.

First, it must be admitted by all that the moral atmosphere of the mine or that of the average industry is not conducive to the good habits and training of young men. The boy put to work at an early age in the mine is thrown into contact with men of all classes and nationalities. While learning how to put up a brattice, drive a mule and many other things of a practical nature, he picks up at the same time much perverted information on matters that should be taught him only by his parents or teachers. In addition to this, he gets first-hand information on drinking and gambling, by being forced to listen to the discussion of these subjects by devotees. While there are many men who neither drink nor gamble, and others who will refrain from discussing such subjects or repeating immoral stories when a boy is present, their influence, which is largely negative, is more than offset by the conduct of other men who are indifferent to the welfare of the boys and who take a certain delight in instilling evil into the youthful mind.

The man who is down and out presents a certain picturesqueness that appeals to the boyish mind. One such man will often exert a greater influence than a half-dozen men of correct habits. It frequently happens that the boy who has had the advantage of a good home most readily succumbs to these evil influences because of their novelty. If, then, the boy is to become morally strong and a good citizen, keep him from these influences as long as possible or, at least, until his character is formed.

Second, the boy in the mine is surrounded by bodily dangers that he does not fully appreciate. He does not realize the need of caution but learns to take chances. It is convenient for a boss to send a boy on an errand or with a message to another part of the mine, which exposes him to the dangers of moving cars, contact with live wires, falling roof in places with which he is not acquainted, etc. Also, after the first few days in the mine, the inquisitive mind of the boy leads him to investigate the nature and possibilities of live wires, explosives, etc., which may and often does lead to grave results.

Third, the early practical training of the boy means a corresponding neglect of his education or schooling. Too much cannot be said of the value in after life of a good education. I believe every boy should have the advantage of early schooling, wherever this is possible. Early schooling has at least two recognized features: The culture of the mind, and the application of knowledge to industry. Both are equally important. The miner with no early schooling, when dissatisfied with conditions, finds himself generally helpless to alter them and, under improved conditions, he is often incapable of availing himself of the advantage they afford. His untrained mind does not suggest to him the remedy to apply when he is conscious that something is wrong. The fault lies in the lack of early education, for which he or his parents are generally to blame.

The increase of interest in night schools and correspondence study at home is a silent witness to the need that is felt by the man whose early schooling has been neglected. In view of these facts, I would say: Educate the boy first and let him get his practical training later. It will make him a more intelligent and practical man and a more efficient worker.

Fourth, to start life at the practical end commits the boy to a class of work for which he may not be adapted and in which, therefore, he will never succeed. It gives him no opportunity to choose his vocation in life. He has little chance of advancement, little satisfaction in his work, and becomes easily discouraged. His early training does not make it easy for him to change to another calling. It often happens that ill health will compel a man to quit work in the mine; and, in that case, if he lacks useful knowledge that would enable him to take up other work with promise of success, he is helpless and becomes a vagrant.

I have in mind such a case where a miner, unable to work underground, took up the occupation of steel construction and rose to a position of trust. Another alternative is the field of photography. But, on the other hand, the man who went to work in the mine at an early age, though possibly having a natural adaptation for other work, has little chance later of success, owing to the lack of early schooling that is necessary in all advanced callings. Therefore, give the boy the best early schooling you can and thus afford him a chance to make his own choice of a vocation in life.

Geo. N. Lantz.

New Straitsville, Ohio.

The Certificate Law

Letter No. 7—My experience as a miner who has worked in eight different states in this country and in two shires of Scotland, and has served as mine foreman in three states during the past 15 years, leads me to declare in favor of a *universal* certificate of competency for mine foreman. The work of mining coal and transporting it to the tipple, in respect to safety and economy of operation, requires about the same skill, care and experience on the part of the mine foreman, in whatever state or district the mine may be located. The man who shows the greatest fitness and capacity for the position is generally the one who is most successful, as operators have not much use for incompetent men.

In my opinion, the ambitious mine foreman who holds a certificate in one state and who desires to make a change, should not be barred from holding a similar position in another state. I cannot see that a universal certificate entitling the holder to fill a position as mine foreman in any state will jeopardize lives or property, as this would depend on the competency of the man. On the other hand, such a law would broaden the field of competition and encourage ambitious miners to qualify and fit themselves for positions of trust and responsibility. I believe the law should, likewise, be extended to cover the certificates for fireboss and hoisting engineers so that they could operate in a wider field.

In the practical application of this plan, I would suggest that examining boards, when preparing the questions for examination and granting certificates of competency, should treat the subject in its broadest aspect, so as to cover the different conditions that are liable to occur in mining coal. The inclination or pitch of coal seams varies from zero to 90 deg., so that the seam may lie at any inclination from flat to perpendicular, requiring the adoption of different methods for the extraction of the coal. The possible presence of gas will require a knowledge of how it may be safely removed. It is true the laws are different in the several mining states; but these are in printed form, and a man must acquaint himself thoroughly with the mining laws of the state in which he desires to hold a position as mine foreman.

R. J. Pickett.

Shelburn, Ind.

⁂

Letter No. 8—I have been much interested in the discussion of the question relating to a uniform mine-foreman certificate law. I notice that some correspondents, in discussing this question, hold that a mine foreman in one state should be considered as being qualified to hold the same position in another state; while others claim that it is better for each state to conduct its own examinations and not to consider the certificate issued by an examining board in another state.

I would like to ask: Cannot this question be compromised and a common ground be determined that would overcome the objections that have been raised? Our mines, at present, are mostly classified as "gaseous" and "nongaseous" mines. We are told the attempt is being made in West Virginia to classify mines as "nonhazardous," "hazardous" and "extra hazardous." Is it not possible to carry out this idea of classification in respect to the certificate law, and group the mines throughout the coal-producing states into two or more classes? The certificates of competency for mine foremen could then be graded to suit these different classes of mines. With suitably organized and authorized examining boards, it would not seem to be difficult to regard a mine foreman certified as competent in one state, to be qualified for holding the same position in another state.

It seems to me that this arrangement would remove the difficulty to which Mr. Wilson refers, Coal Age, Nov. 8, p. 710, where mines located along the boundary between two states were operated under the mining laws of their respective states; and a mine foreman in charge of a mine on one side of the boundary line could not hold the same position in an adjoining mine on the opposite side of that boundary, notwithstanding the conditions in these two mines were precisely identical.

Although the situation may prove, as in this case, somewhat annoying, it must be allowed that the law is a safeguard against inefficiency. I believe that if the suggestion is worth while, there should be some classification of mines determined upon and some standardization of examinations made that would enable the certified foreman in one state to stand as qualified for holding the same position in the same class of mines in another state.

⁂

Analyzing the Mine Cost Sheet

Letter No. 1—Reading the article on this subject by J. B. de Hart, Coal Age, Dec. 6, p. 842, calls to mind how often it has occurred in my own experience, as well as that of others, that I have tried hard to reason with a mine superintendent how the output of coal could be increased very materially and the cost per ton reduced, by making certain changes that were almost insignificant of themselves. I can endorse every statement in that article as true.

At a mine of which I had charge, some time ago, the main-haulage rope on the slope was breaking twice and sometimes three times a day. I argued with the mine superintendent to show him that the time spent in splicing the rope, together with the loss in output, greatly increased the cost per ton of coal loaded and that this would be saved by getting a new rope, which would soon pay for itself by avoiding these accidents. It was often necessary, in this mine, to stay at night and pay men extra time to hunt old rope and have it hauled out from the workings, to replace sections of the main rope where it was ready to break. It might happen, then, that things would run smoothly the following day and nothing would be said.

It is easy to see that the superintendent, in this case, was not a practical man, which is often the case where a man is taken out of a store and placed in charge of a mine to conduct its operation. Perhaps he has never worked a day inside of a mine, and it is very hard to make him understand that it is necessary to do a great many things in order to systematize the work and reduce the cost, in the mine.

Where haulage was done by an electric motor, it has frequently happened that a bad piece of road would greatly delay the work, because cars were continually getting off the track at certain points. This would tie up the road until the cars could be again put on the track. A little grading of the roads would have overcome this difficulty and reduced the cost by increasing the output. The superintendent promised, time after time, to let me grade the road, after I had explained to him that this could be done without decreasing the output. But he always seemed unwilling to have me go ahead with the grading. There were places where, owing to depressions in the road, the cars would bump together, throwing much of the coal off, which frequently caused wrecks that tore up the track. Besides this causing much delay, it was necessary to put on a night shift to clean the road, all of which could be avoided with a little expense of time and labor to put the track in good condition; but the reply was always: "We cannot stand the expense at the present time."

The suggestion is made that a mine foreman who is trying in every way possible to reduce the cost of putting the coal on the surface, should be encouraged and given full credit for what he accomplishes. But, instead of this, in most cases, a mine foreman who dares to insinuate that the conditions under which he is working are unnecessarily increasing the cost per ton will soon be given to understand that, if the place does not suit him, he can leave. I have known this to happen in more cases than one. I am happy to say that the company by which I am at present employed is making every effort to show the foreman where and how the cost per ton can be reduced. That is what counts in a coal mine. We are continually told to keep our roads well graded, so that the coal can be hauled with as little trouble and delay as possible.

Our general superintendent goes inside the mine each week himself, to see that everything is done. He is always ready to give full instructions and explanation of what is not understood; and suggestions of a foreman are not turned down, but are heard and carefully considered. The foreman is instructed to see that the bituminous-mine law is fully enforced, in every point pertaining to the welfare of the men. Such an interest on the part of a superintendent makes the work run more smoothly and goes far toward reducing the cost per ton. A lack of harmony between the superintendent and his foreman is bound to increase the cost of operation.

John J. Clark,
Assistant Mine Supt.,
B. & S. Coal & Coke Co.

Sagamore, Penn.

⁂

Letter No. 2—It was with much interest I read the foreword, Coal Age, Nov. 15, and the article along the same line by J. B. de Hart, Dec. 6, p. 842. As I view this question, there is only one obstacle to overcome, in acting upon your suggestion in the second paragraph of the foreword, and that is, the big word "if." Do we "recognize the camp?" It has been my experience, as it has probably been that of others, to be refused the "$600 to build a bathhouse." The reason given for the refusal is that the proposition is more "a matter of sentiment than one of practical business."

In the case to which I refer, the matter was put up to the company with the argument that it would mean a larger labor force; and a larger labor force would mean an increased tonnage, with a reduction in the cost of production. The reply given, however, was to the effect that "neighboring mines did not have a bathhouse." It was argued that the expectation of an increase in labor force was "pure assumption and quite problematic." Should the argument be pressed further, the manager would usually be told that he might build a bathhouse when he had put the mine on a paying basis.

Upon the receipt of this answer, the feelings of the average mine manager are similar to those of the man who tried to purchase a sawmill on credit. On being told that he would have to put up the price before he could be given possession of the mill, he replied that he had not the price and if he had he would not want the mill. If a manager can put the mine on a paying basis without the bathhouse, there is no real need, from a business standpoint, of building one.

This applies to small companies more than to large ones. The manager of a small coal-mining company, today, has before him a herculean task. If he fails to put the mine on a paying basis, it is more often due to a shortsighted policy on the part of the company, rather than to any mismanagement on the part of the one in charge. But the manager is the one who must shoulder the burden and take the blame.

It is surprising to note the number of companies that are in just the condition described in your foreword. It requires more of a hypnotist than a manager, in most cases, to make the company see the need of a practical and reasonable proposition as it appeals to him. He studies the question daily from a practical standpoint; he is the man who must make good and produce results. He feels the need more than anyone else of a broad-gage, far-sighted business policy.

I have in mind an instance of this. Not long ago, a proposition was put up to me by a company and I was asked to suggest a way to make it pay. The president of the company wanted to know if I did not believe it would be a wise plan to do away with the power plant and haul all of the coal from the mine with mules. He suggested, also, shooting the coal from the solid and doing away with mining machines. He, further, wanted to replace the fan with a ventilating furnace. His principal argument, in favor of this plan, was that he had been connected with several operations where there was no power plant and the mine was worked at a profit. Without any further analysis of the situation and without making any attempt to ascertain the true reasons why these mines were run at a profit, while the one of which we had charge appeared to be a losing proposition, he concluded blindly that the uptodate equipment of this mine was a needless expenditure of capital, which could be put to better use.

After listening patiently to his suggestions, I attempted to show him that the real trouble, in the present case, was that some of the machinery was out of repair and must be put in good condition to do the efficient work of which it was capable. I argued that if this was done, it would not be long before the mine would be operated on a paying basis and prove a profitable investment. He failed to see the wisdom of this advice; and it seemed impossible to convince him that a comparatively slight additional outlay for needed repairs was all that was required to produce good results and put the coal on the track at a profit.

While this is but one incident among a hundred others, it illustrates the policy of a large number of companies who are mining coal, today, at a small profit and too often at a loss. Imagine, for a moment, the manager of such a company asking for $600 with which to build a washhouse. He might as well ask, at the same time, to be relieved of his duties as manager. The case is almost hopeless under these conditions, and, as I said before, the manager for such a company has on his hands a herculean task. In this connection, I thoroughly endorse the excellent article of Mr. de Hart on Analyzing the Mine Cost Sheet. The article is opportune and should appeal forcibly to every coal-mining company. I have not written this in criticism so much as to point a way to remedy the difficulty and assist the mine manager and foreman in their honest endeavors to produce results.

G. M. Shoemaker.

Pennington Gap.

Technical Education in Mining

The foreword, Coal Age, Nov. 1, after setting forth the desirability of having a technically educated man in the position of mine manager, proceeds to compare this man unfavorably with the so called practical man. This seems a little illogical, if not unfair. If it were assumed that competent engineers attack problems in mining, in the manner described, the question might justly be asked: What use are engineers in any organization? What confidence can be placed in an engineer who would consider only "first cost and relative life of mine cars," or, having a knowledge of "fan efficiencies and water-gage readings, neglected to consider the size, length and condition of the airway," in respect to improving the ventilation.

In justice to the engineer, permit me to cite one or two instances where his technical education and training are indispensable? At a certain mine not employing an engineer, a fan is needed and several manufacturers are asked to investigate and submit bids for the same. All reliable manufacturers of mine equipment have capable engineers in their employ; but, as every operator knows, these engineers cannot be expected to make full and careful investigation of the conditions inside the mine, when the chances are only one in ten of their securing the contract for the installation.

Another instance is: A practical manager wanted a tipple profanely quick, and he got it; and, as a result, a very brittle coal is dropped into cars from a height of about 8 ft., producing loss from breakage of coal and causing complaints from consumers. In some cases, tipples are built requiring the coal to be hauled up an incline, where a change of location would permit of a gravity road leading to the tipple.

On the other hand, I know of cases where engineers were called into consultation, in the matter of purchase of mine cars and interested themselves in determining the relation between wheel-base and minimum radius of curvature for the tracks; the width of car was decided in accordance with roof conditions. The center of gravity of the load in the cars was kept as near as possible to the floor of the mine.

The suggestion in the foreword, that able men of both classes are of advantage, should not mislead anyone. The man in authority without some technical training is fast passing from the mines; because, with the help of such mining papers as Coal Age and the assistance of correspondence schools and night schools, a man need not leave his work to obtain a good technical education.

COLORADO ENGINEER.

Trinidad, Colo.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

Natural Ventilation In Slope Mines and Dip Workings—The same condition in respect to the natural heat of the mine producing or modifying the circulation of the air, holds in all slope mines and dip workings, the same as in shafts and drifts. Whenever the mine temperature is much below or above that of the outside atmosphere, the difference in temperature makes the return air heavier or lighter than the intake air; and the difference in weight of these two air columns destroys the equilibrium of the mine air and creates a current in the airways throughout the mine.

A considerable difference of temperature is often observed between the dip and rise air currents in particular sections of a mine. It is this difference in the temperatures of the intake and return currents that often makes dip workings harder to ventilate in summer than in winter. For the same reason, rise workings are frequently found to be more easily ventilated in the summer season.

Air Columns—The term "air column," like water column, always refers to a vertical column. The air column, in ventilation, is an imaginary vertical column of air, of unit section (commonly, 1 sq.ft.) and of such height that its weight, in pounds, is equal to the pressure it measures (lb. per sq.ft.). The density of the air (wt. per cu.ft.) is either stated or understood, so that when the height of air column is given the pressure it indicates is readily calculated.

In mining practice, it is common to express ventilating pressure in feet of air column or, as we say, "head of air." Calling the weight of 1 cu.ft. of air w (lb.) and the head of air column h (ft.), the pressure p (lb. per sq.ft.) is calculated by the formula

$$p = wh$$

Or the air column corresponding to any given pressure is found by transposing this formula; thus,

$$h = \frac{p}{w}$$

Example—What is the head of air column corresponding to a ventilating pressure of 10 lb. per sq.ft., assuming a temperature of 60 deg. F. and a barometric pressure of 30 in.?

Solution—The weight of 1 cu.ft. of air, at the given temperature and pressure is

$$w = \frac{1.3273\,B}{460 + t} = \frac{1.3273 \times 30}{460 + 60} = 0.0766 \textit{ lb., nearly}$$

The required head of air is then

$$h = \frac{p}{w} = \frac{10}{0.0766} = 130.5 \textit{ ft.}$$

Example—Find the ventilating pressure and water gage corresponding to 80 ft. of air column, at the same density.

Solution—

$$p = wh = 0.0766 \times 80 = 6.128 \textit{ lb. per sq.ft.}$$
$$w.g. = 6.128 \div 5.2 = 1.18 \textit{ in., nearly}$$

The Coal Age Pocket Book

Air Column and Water Gage—Since water is practically 815 times as heavy as air at normal temperature and pressure, 1 ft. of water column measures the same pressure as 815 ft. of ordinary air column; and 1 in. of water gage is therefore equal to 815 ÷ 12 = say 68 ft. of air column, which gives the following:

Rule—To reduce feet of air column to inches of water gage, divide by 68.

To reduce inches of water gage to feet of air column, multiply by 68.

Air Column and Unit Ventilating Pressure—Since air at a normal temperature and pressure weighs, practically, 13 cu.ft. to the pound, every 13 ft. of air column represents, approximately, a ventilating pressure of 1 lb. per sq.ft., which gives the following:

Rule—To reduce feet of air column to unit pressure, divide by 13.

To reduce unit pressure (lb. per sq.ft.) to feet of air column, multiply by 13.

Air Column and Barometric Pressure—Since 1 cu.in. of mercury weighs 0.491 lb., each inch of mercury column indicates a pressure of 0.491 lb. per sq.in.; or 0.491 × 144 = 70.7 lb. per sq.ft.; and since each pound per square foot of pressure corresponds to 13 ft. of air column, approximately,

$$1 \textit{ in. (barometer)} = 70.7 \times 13 = \textit{say } 920 \textit{ ft. (air column)}$$

Rule (Approximate)—To reduce feet of air column to inches of barometer, divide by 920.

To reduce barometric pressure (inches) to feet of air column, multiply by 920.

Barometric and Unit Ventilating Pressure—Barometric pressure is always expressed in inches of mercury column. Unit ventilating pressure is expressed in pounds per square foot, ounces per square inch, or inches of water gage.

Rule—To reduce barometric pressure (inches) to ventilating pressure (lb. per sq.ft.), multiply by 70.7; or to ventilating pressure (oz. per sq.in.), multiply by 0.491 × 16 = 7.856; or to water gage (in.), multiply by 70.7 ÷ 5.2 = 13.6, which is the specific gravity of mercury referred to water as a standard.

Since 13 ft. air column represents a pressure of 1 lb. per sq.ft., a pressure of 1 oz. per sq.in. corresponds to an air column of (13 × 144) ÷ 16 = 117 ft.

EQUIVALENTS IN PRESSURE

Air column (ft.) = 68 × water gage (in.);
= 13 × pressure (lb. per sq.ft.);
= 117 × pressure (oz. per sq.in.);
= 920 × barometric pressure (in.);
Pressure (lb. per sq.ft.) = 5.2 × water gage (in.);
= 70.7 × barometric pressure (in.);
Pressure (oz. per sq.in.) = 0.58 × water gage (in.);
= 7.86 × barometric pressure (in.);
Water gage (in.) = 13.6 × barometric pressure (in.);

INQUIRIES OF GENERAL INTEREST

Electrical Resistance of Steel Rails

We have had an argument about the difference in resistance between a copper wire and steel rails, and desire to submit the question to you, in hopes that you can give us the necessary information. The question is:

What is the difference in resistance between a 4-O round copper wire 3000 ft. long and the two 25-lb. steel rails, in a track, 2000 ft. long, followed by two 30-lb. steel rails, in 1000 ft. of track? The rails are bonded with pressed-terminal all-wire 2-O bonds.

Will you also kindly state how many kilowatt-hours will be available at the end of a 250-volt line, where a 30-hp. motor, 3000 ft. from the generator, is taking 100 amperes?

H. E. BULLOCK.

Hazard, Ky.

The resistance of 1000 ft. of a 4-O copper wire at, say 68° F. (20°C.), as taken from a table giving the resistances of copper wires for different gages and temperatures, in ohms per thousand feet, is 0.04893 ohm. The resistance for such a conductor 3000 ft. long is then, 3 × 0.04893 = 0.14679 ohm.

An approximate rule for calculating the resistance of copper wire per thousand feet, in ohms, is to divide 10,000 by the size of the wire in circular mils. Thus, for a 4-O wire (211,600 circ.mils), the resistance is, approximately,

$$R = \frac{10,000}{211,600} = 0.04726 \textit{ ohm per } 1000 \textit{ ft.}$$

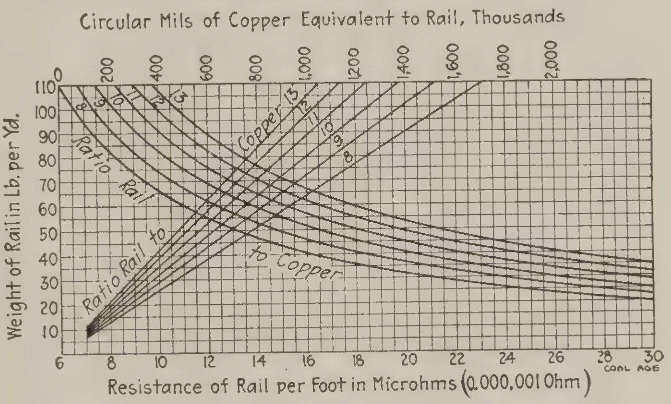
This rule should only be used in rough calculations. When accuracy is desired, the resistance for the wire should be taken from electrical tables, as above stated.

The resistance of steel rails, for the same cross-section and length, varies with the composition of the steel. The presence of sulphur and manganese, particularly the latter, greatly modifies the resistance of the steel. It has been found that this resistance will vary from about eight to thirteen times that of copper of the same sectional area and at the same temperature. This has given rise to what is termed the "ratio of rail to copper" or the "rail-to-copper ratio." The results of numerous experiments have made it possible to calculate the equivalent *circular mils of copper* corresponding to any given weight of rail in pounds per yard, for any rail-to-copper ratio. To do this, the weight of rail, in pounds per yard, is multiplied by the constant corresponding to this ratio, as determined by the composition of the steel. The value of this constant, for the several ratios, is as follows:

Rail-to-Copper Ratio	Constant	Rail-to-Copper Ratio	Constant
8	15,550	11	11,360
9	13,820	12	10,360
10	12,500	13	9,590

Applying this method to the solution of the question asked by correspondent and assuming a rail-to-copper ratio of 10, the constant for this ratio, as taken from the above table, is 12,500. Then, for a 25-lb. rail, the equivalent circular mils of copper is 25 × 12,500 = 312,500. Electrical tables are not generally extended to include as large a wire as this area indicates. The resistance in ohms per thousand feet, however, can be calculated, approximately, by the rule previously given. Thus, 10,000 ÷ 312,500 = 0.032 ohm. The resistance of the two rails, in the first 2000 ft. of this track, is the same as the resistance of a single 25-lb. rail 1000 ft. long, or 0.032 ohm.

Again, for a 30-lb. rail of the same composition, the equivalent circular mils of copper is 30 × 12,500 = 375,000. The corresponding resistance is, therefore, approximately, 10,000 ÷ 375,000 = 0.0267 ohm. The resistance of the two rails, for 1000 ft. of track, is one-half of this amount, or 0.01335 ohm. The total rail resistance in this track is, therefore, 0.032 + 0.01335 = 0.04535 ohm; and the difference, in favor of the iron rails, is 0.14679 — 0.04535 = 0.10144 ohm.



DIAGRAMS SHOWING COPPER EQUIVALENT AND ELECTRICAL RESISTANCE OF STEEL RAILS

The above combined diagrams, taken from the Ohio Brass Co.'s catalog, show graphically the circular mils of copper, of equal electrical resistance to steel rails of different weights and "rail-to-copper ratios." The curved lines show the resistance, in microhms, of steel rails of different weights and ratios.

The diameter, in inches, of a copper wire that is the electrical equivalent of a steel rail of a given weight (lb. per yd.) may be calculated by multiplying the respective constant taken from the above table, by the weight of the rail, extracting the square root of the product and dividing that result by 1000. Thus, for a rail-to-copper ratio of 10, the constant is 12,500. Then, the diameter of the copper-wire equivalent is

$$d = \frac{\sqrt{25 \times 12,500}}{1000} = 0.559 \textit{ in.}$$

In answer to the second question, a 30-hp. motor consumes 30 × 746 = 22,380 watts or 22.38 kw. If this motor is taking, as stated, 100 amp., the voltage, at the full capacity of the motor, is 22,380 ÷ 100 = 223.8 volts. The drop in voltage for this line is, therefore, 250 — 223.8 = 26.2 volts. The work performed by this motor, in each hour, when working at its rated capacity, is 22.38 kw.-hr.

EXAMINATION QUESTIONS

Miscellaneous Questions

(Answered by Request)

Ques.—A mine airway is 8 ft. high, 8 ft. wide and 10,000 ft. long; (a) find the rubbing surface. (b) Assuming a unit of resistance, $k = 0.00000002$ and a water gage $w.g. = 2$ in.; what is the velocity of the air current? (c) What is the quantity of air in circulation? (d) What is the horsepower on the air?

Ans.—(a) This airway being square its perimeter is $4 \times 8 = 32$ ft.; the rubbing surface is then $s = 32 \times 10{,}000 = 320{,}000$ *sq.ft.*

(b) The unit pressure corresponding to 2 in. of water gage is $2 \times 5.2 = 10.4$ lb. per sq.ft. The sectional area of this airway is $8 \times 8 = 64$ sq.ft. The velocity of the air current, in this case, is therefore

$$v = \sqrt{\frac{pa}{ks}} = \sqrt{\frac{0.00000002 \times 320{,}000}{10.4 \times 64}}$$
$$= 322.5 \textit{ ft. per min.}$$

(c) The quantity of air in circulation is

$$q = a\,v = 64 \times 322.5 = 20{,}640 \textit{ cu.ft. per min.}$$

(d) The horsepower on the air is

$$H = \frac{qp}{33{,}000} = \frac{20{,}640 \times 10.4}{33{,}000} = 6.5 \textit{ hp.}$$

Ques.—(a) A certain power is producing 20,640 cu.ft. of air per min. in an airway 8x8 ft., at a velocity of 322.5 ft. per min.; what quantity and velocity will the same power produce in an airway 6x6 ft. of the same length?

(b) What horsepower would be required to produce the same quantity of air in this airway as in the previous one and what would be the water gage, in that case?

Ans.—(a) For the same power on the air, the quantity of air in circulation varies directly as the sectional area and inversely as the cube root of the perimeter, the airways being of the same length. Therefore, the quantity ratio is equal to the area ratio times the cube root of the inverse perimeter ratio. The sectional areas and perimeters of the two airways are as follows:

Airway 8x8 ft.,

$a = 8 \times 8 = 64$ *sq.ft.*, $o = 4 \times 8 = 32$ *ft.*

Airway 6x6 ft.,

$a = 6 \times 6 = 36$ *sq.ft.*, $o = 4 \times 6 = 24$ *ft.*

Equating these values as ratios, as stated above,

$$\frac{q_2}{q_1} = \frac{a_2}{a_1}\sqrt[3]{\frac{o_1}{o_2}} = \frac{36}{64}\sqrt[3]{\frac{32}{24}} = \frac{9}{16}\sqrt[3]{\frac{4}{3}} = \frac{9}{16}\sqrt[3]{1.333} = 0.619$$

But. $q_1 = 20{,}640$ cu.ft. per min. and calling the required quantity $q_2 = x$,

$$\frac{x}{20{,}640} = 0.619$$

$$x = 20{,}640 \times 0.619 = 12{,}776, \text{ say } 12{,}800 \textit{ cu.ft. per min.}$$

The velocity in the 6x6-ft. airway may be found in two ways. For the same power on the air and the same length of airway, the velocity varies inversely as the cube root of the perimeter of the airway, or the velocity ratio is equal to the cube root of the inverse perimeter ratio; thus,

$$\frac{v_2}{v_1} = \sqrt[8]{\frac{o_1}{o_2}} = \sqrt[3]{\frac{32}{24}} = \sqrt[3]{\frac{4}{3}} = \sqrt[3]{1.333} = 1.1006$$

But $v_1 = 322.5$ ft. and calling the required velocity of air x,

$$\frac{x}{322.5} = 1.1006$$

$$x = 322.5 \times 1.1006 = 355 \textit{ ft. per min.}$$

The velocity of the air current can also be found as follows, when the sectional area is known:

$$v = \frac{q}{a} = \frac{12{,}800}{36} = 355 \textit{ cu.ft. per min.}$$

(b) To increase the quantity of air in circulation in the 6x6-ft. airway, to that produced in the 8x8-ft. airway, it will be necessary to increase the power. Then, considering the 6x6-ft. airway only, since the power varies as the cube of the quantity of air in circulation, the power ratio is equal to the cube of the quantity ratio. Thus, calling the required power x, the original being 6.5 hp.

$$\frac{x}{6.5} = \left(\frac{20{,}640}{12{,}800}\right)^3 = \left(\frac{129}{80}\right)^3 = (1.6125)^3 = 4.19$$

$$x = 6.5 \times 4.19 = 27.235 \textit{ hp.}$$

Since the original water gage was not given for the 6x6-ft. airway, it is necessary to calculate the water gage, in this last case, from the circulation of 20,640 cu.ft. of air by 27.235 hp.; thus,

$$w.g. = \frac{33{,}000\,H}{5.2\,q} = \frac{33{,}000 \times 27.235}{5.2 \times 20{,}640} = 8.37 \textit{ in.}$$

Ques.—An airway 8x8 ft., 10,000 ft. long, is passing 20,640 cu.ft. of air per min., with a given power. (a) Assuming the *power* on the air remains unchanged, and a regulator having an opening of 3 sq.ft. is introduced into this airway, how much will the circulation be decreased? (b) Assuming the power on the air remains unchanged, will the regulator increase the water gage? (c) If the original water gage was 2 in., what will be the water-gage reading after the regulator is in place? (d) What water gage and horsepower on the air will be required to increase the circulation to the original amount with the regulator still in place?

Ans.—(a) Calling the original quantity of air in circulation q, the rubbing surface s, and the sectional area a; the area of the opening in the regulator A and the required quantity of air, after the regulator is in place, x, this reduced volume of air may be calculated by the formula

$$x = q\sqrt[3]{\frac{A^2 s}{A^2 s + 41.6\,a^3}}$$

The rubbing surface is $s = 10{,}000\ (4 \times 8) = 320{,}000$ sq.ft. and the sectional area, $a = 8 \times 8 = 64$ sq.ft.

$$x = 20{,}640\sqrt[3]{\frac{3^2 \times 320{,}000}{3^2 \times 320{,}000 + 41.6 \times 64^3}}$$
$$= 12{,}250 \textit{ cu.ft. per min.}$$

(To be concluded next week)

COAL AND COKE NEWS

Washington, D. C.

In its report submitted to Congress on Dec. 19, the Interstate Commerce Commission reviews the work of the past year with reference to the prosecution of coal companies and rather severely criticizes coal miners for the methods they have been employing in their business. The Commission points out that an indictment has been secured against the Lehigh Valley R.R. Co. for granting a concession by leasing certain lands at Buffalo for a coal yard to the Yates-Lehigh Coal Co. at less than a fair rental. Similarly, an indictment has just been returned against the Wichita Falls & Northwestern R.R. Co. for granting a concession by subletting certain land to an interstate shipper at a lower retal than the carrier was itself paying to the original lessor.

Another indirect device for granting a rebate for which indictment has been secured during the year, says the Commission, is that resorted to by the Vandalia R.R. Co. in favor of the Lumaghi Coal Co. The Vandalia Mineral Co. is a corporation formed by interests controlling the Vandalia R.R. Co. for the purpose of holding coal-mining lands which the Vandalia R.R. Co. under its charter was not permitted to own. The Vandalia Improvement Co. is a holding company also controlled by the interests controlling the Vandalia R.R. Co.

When the Vandalia Mineral Co. was organized the Vandalia Improvement Co. bought all of its stock with money furnished by the Vandalia R.R. Co. Investigation showed that the Vandalia Mineral Co. loaned $260,000 to the Lumaghi Coal Co. to buy coal-mining properties located on the line of the Vandalia R.R. Co. This loan was made at 2 per cent. interest on condition that the Lumaghi Coal Co. would ship all of its coal over the Vandalia R.R.

It further developed that the Vandalia Mineral Co. has borrowed this money from a bank at 4 per cent. interest on notes which had been endorsed by the Vandalia R.R. Co.

Still another case in which carriers are alleged to have connived with a shipper for the purpose of defeating the published rates by roundabout methods was presented to a Federal grand jury in the eastern district of Illinois. The O'Gara Coal Co., a New York corporation, with its principal office in Chicago, had a contract for supplying fuel coal to the Grand Trunk Ry. Co. of Canada. This coal was shipped from the mines in southern Illinois via the Cleveland, Cincinnati, Chicago & St. Louis and Chicago, Indiana & Southern to South Bend, Ind., where it was turned over to the Grand Trunk Western Ry. Co. All of the shipments were billed by the O'Gara Coal Co. to Battle Creek, Mich., a point on the Grand Trunk Western.

As a fact, however, the contract of the O'Gara Coal Co. with the Grand Trunk Ry. Co. provided for delivery of the coal at South Bend, Ind., the junction point between the Chicago, Indiana & Southern Ry. and the Grand Trunk Western. By the arrangement with the Big Four the O'Gara Coal Co. prepaid to this carrier the freight charges to South Bend on the basis of unpublished divisions of the through rates to Battle Creek.

These divisions were less than the local rates to South Bend which should have applied. In this manner the O'Gara Coal Co. secured concessions on all of the coal shipped. The tariffs of the Cleveland, Cincinnati, Chicago & St. Louis expressly prohibited partial prepayment of freight charges when through rates were in effect. In order to make possible the practice of the O'Gara Coal Co. the Cleveland, Cincinnati, Chicago & St. Louis and the Chicago, Indiana & Southern Ry. Co. ignored this tariff provision.

A Fictitious Destination Is Given

Two important prosecutions have been undertaken against carriers for having their company coal billed to fictitious destinations on their line in order to defeat the published rates to actual destinations. Investigations showed that in several hundred cases the Seaboard Air Line Ry. Co. had carloads of coal shipped from Briceville, Tenn., and nearby points on the Southern Ry. billed to the Seaboard Air Line at Williams, Ga.

These shipments were delivered by the Southern Ry. to the Seaboard Air Line at its junction at Helena, Ga. Many of the shipments were consumed at that junction point and others were diverted to other points, but none of them went to Williams, Ga., as the billing directed.

The result was that, instead of paying the local rate of the Southern Ry. Co. from Briceville to Helena or the joint rate from Briceville to destination and receiving out of it jointly its appropriate division the Seaboard Air Line paid the joint rate applying to the more distant point out of which the Southern Ry. received a division much smaller than its local rate to the junction or its division of the joint rate to actual destination.

Other schemes of the same kind are discussed at some length.

The Alaskan Ry. Receives Endorsement

In a report sent to Congress Dec. 24, Secretary of the Interior Lane endorses the plan of a Government railroad in Alaska and urges the opening up of Alaskan coal fields under a leasing and royalty system which he says would make it sufficiently worth while for investors to engage in the exploitation while it would protect the Government. Secretary Lane also says that the same leasing system ought to be applied to Western coal and remarks:

> We wish cheap coal and at the same time a minimum of waste. . . . . We desire competition without waste, a frank impossibility. . . . . In a new country where there must be large development and higher rewards for enterprise, the safest practicable method is to lease the land, the Government taking a modest royalty and retaining some measure of control over operation.

PENNSYLVANIA

Anthracite

Pottsville—Plans for the new coal stripping operations at the top of the Broad Mountain are now in progress. This will involve an expenditure of many thousands of dollars, by the Philadelphia & Reading Coal & Iron Co. The surface from Mt. Laffee to Millins Hill is to be cleared away, exposing the valuable coal measures.

It is unofficially stated that within a few days one of the most historic collieries of the anthracite region, East Bear Ridge, near Mahanoy Plane, will pass from the control of the Philadelphia & Reading Coal & Iron Co. to the Susquehanna Coal Co. This mine has been worked since 1830, or over three-quarters of a century.

Hazleton—Anthracite miners are already beginning preparations for the spring of 1916, when the present wage agreement expires. Local No. 1739 of Lansford has adopted a resolution to be offered at the International Convention of the United Mine Workers, in Janury, urging that agitation and organization of unorganized labor in the United States and Canada be continued, in order that in 1916 the mine workers will be in a position to make a general stand, and upon the eve of a great presidential election "make great headway along the line of political and economic action."

Concrete City—Every one of the twenty double houses in Concrete City, the model village of the D. L. & W. Coal Co., near Nanticoke, is now occupied; and with the completion of the park in the big square 300x410 ft., which is surrounded by the houses, the settlement will be as perfect of its kind as Forest Hill, L. I., the model suburb of the Russell Sage Foundation.

Bituminous

Royal—Thieves recently stole $700 in cash from the W. J. Rainey Coal Co., office in the store. The money was in pay envelopes and represented the amount miners has failed to lift the previous day. The theft was not discovered until delinquet miners appeared at the office for their pay.

Pittsburgh—It is said that President Van Bittner has been reëlected president of district No. 5, by at least 6000 majority. F. P. Hanaway is elected vice-president by about the same majority and Robert Wood, secretary-treasurer, while Philip Murray, was reëlected international board member.

WEST VIRGINIA

Fayetteville—Three dwelling houses belonging to the Cannelton Coal Co., at Cannelton, were totally destroyed by fire recently entailing a severe loss. Several other buildings were badly damaged, all being partially insured.

Charleston—An extension of time until Feb. 15 has been given to the English syndicate contemplating the purchase of most of the properties in the New River district. An agreement was reached at a recent conference on the terms of the contract, and the matter is now wholly in the hands of those who are to raise the finances for the transfer of the property.

Wheeling—Following the attack upon Frank Long by four Italians believed to be members of the Italian Mafia society, the arrest of Long's assailants is expected. Mr. Long had been implicated in the mine trouble of Brooks county, and for some time past had heard rumors that he was marked by the Black Hand.

ALABAMA

Birmingham—A petition in involuntary bankruptcy was recently filed against the Oak Leaf Coal Co., of Cordova. The petitioning creditors were: The Hendon Hardware Co., J. A. Williams, Lantrip Bros., and J. P. Higginbottom, all of Cordova.

OHIO

Columbus—A movement has been started among the employers of labor in Ohio in which the coal operators have joined for a number of amendments to the Workmens Compulsory Compensation law which becomes effective Jan. 1, 1914. As the law stands at present hardships are worked on employers and efforts will be made to secure amendments, which will make it less burdensome. A number of bills are now being prepared to be presented at the extraordinary session of the legislature.

Belleaire—Reports which have been in circulation recently that the rail and river mines were to shut down on account of slack orders are false. According to a semi-official statement, if any time has been lost, or is lost in the future, it will be because a sufficient number of cars to handle the output cannot be secured.

INDIANA

Clinton—Miners in the local unions in the Clinton field met here to consider recommendations for the biennial settlement between miners and operators in the central competitive district, which will have its first consideration at a joint meeting in Indianapolis Jan. 6. Both sides are said to be pretty well satisfied with the present agreement and much less difficulty than formerly is expected in reaching a settlement. Indiana operators seem to have prospered the last two years and miners have had comparatively steady work.

Miners at the Lyford mine struck recently because the superintendent asked some of them to wade through wet bottoms to reach their rooms and they demanded the dismissal of the superintendent. The district president censured the men for stampede methods and they went back to work, after the company agreed to keep the entries as dry as possible.

Vincennes—The American Coal Co. has completed two miles of switch from the Knox mine to Aliceville, a new town near Vincennes, started by the establishment of a mining camp by the company. About 300 miners, mainly from Hymera, have moved here and 300 more are expected by next summer.

Brazil—Operators in the block field say they are finding it hard to meet the competition in Chicago, of the unorganized strip mines in and around Patricksburg, in Owen and Green counties. The union operations pay miners $1.15 a ton while the miners in the non-union mines, it is said; get $1 to $2 a day. There are no regulations as to the width of bars or screens and the non-union mine can put a cleaner coal on the market.

ILLINOIS

Marion—At the recent election at Energy, a mining town northwest of here, the women successfully out-voted the miners, and succeeded in piling up a majority against he saloon element.

Springfield—It is understood here that the principal contentions of the miners in their next agreement with the operators will be a raise of wages and a shorter day, or one of seven hours. The present agreement expires next spring.

MISSOURI

Novinger—Miners at Novinger, Mo., were unable to get their pay checks cashed recently, as the result of a fire which destroyed the Union bank. While the safe was fireproof, the casing and breaching became sweated together and bank officials were unable to open it. Mine officers sent to St. Louis for money and paid the miners within 24 hours.

St. Louis—The hearing before Commissioner Harlan of the Interstate Commerce Commission, recently, on behalf of the railroads for an increase of 5½% in coal rates to St. Louis, and also on behalf of several petitioners to abolish the 20c. per ton bridge toll to St. Louis, brought out the fact that the railroads were discriminating to the extent of 10c. per ton against the City of St. Louis, in favor of East St. Louis, Granite City, and Madison.

It also developed the fact that the fight for the removal of the bridge toll was inspired almost altogether by the operators of mines in the Inner District taking the 52c. freight rate to St. Louis. This is an old fight between the operators of the Inner District and the operators of the Outer District, which takes the 67c. freight rate to this city.

The operators in the Inner District want their rate reduced, and want the Commission to raise the rate from the Outer District. It is likely that the Commission will order, as a result of the testimony, the St. Louis Terminal Railway Association to reduce the Bridge Toll of 20c. a ton to 10c. a ton, but that is about as far, competent authority claims, as the Commission will go as a result of the hearings.

NORTH DAKOTA

Medora—The Medora coal mine is again in operation, and the owner claims the only kiln dried lignite in the state. It is estimated by the State Geologist that the mine property will produce 1,400,000 tons.

COLORADO

New Castle—Union miners who recently went on strike here and whose places were taken by the men who met death in the recent coal mine disaster, almost to a man volunteered to enter the mine after the explosion to recover the bodies of the dead. The organization of the United Mine Workers also furnished $300 to be used by the union to relieve the distress of the families of non-unionists.

OREGON

Roseburg—Excitement is still high in the new coalfield 40 miles east of here and many locations are being made. A good grade of coal is found, which experts say is equal to the Pennsylvania product and much better than other coals that have been mined in Oregon.

WASHINGTON

Morton—Nine persons have made application to obtain patents each for 160 acres of coal land near this town. The development of these lands will mean much for this section, as the coal is a high-grade bituminous.

FOREIGN NEWS

Juneau, Alaska—The registrar in the land office has recommended to the commissioner of the general land office that charges against the Willoughby coal claims in the Bering River district, be dismissed. Cancellation was sought on account of the claimant's failure to prove tract as required by law. There have been no allegations of fraud. The area involved is approximately 480 acres, and the owners are Portland, Ore., and Wilkes-Barre, Penn., parties.

Caracas, Venezuela—Despite the large imports of coal, Venezuela exported during the first half of the current year, 40,026 kilos (88,857 lb.) of this fuel. This is accounted for by the fact that Venezuelan wholesalers supply a number of nearby coast towns in Colombia and Brazil.

PERSONALS

E. T. Hendon has been appointed receiver for the Oak Leaf Coal Co., which recently went into bankruptcy.

Judge Ruppel has appointed the following examining board to hold examinations for mine foreman and fire bosses in Somerset County, Penn.: Mine Inspector Fletcher W. Cunningham, Richard Maize, superintendent of the United Coal Co. and Orville Kregar, of Boswell.

Samuel B. Eaton, for many years general superintendent of the coal mining properties of Crear, Clinch & Co., near Duquoin, Illinois, has resigned. Mr. Eaton has recently disposed of his interest in the company, and will probably move to California. He is succeeded by E. C. Searls.

F. S. Peabody, president of the Peabody Coal Co., and chairman of the Executive Board of the Commonwealth Edison Co., recently delivered an illustrated lecture upon the subject of coal and coal mining before 500 employees of the Commonwealth Edison Co., in the Sherman House at Chicago.

George P. Gallagher, District Superintendent of Exeter, Westmoreland and Maltby Collieries of the Lehigh Valley Coal Co., has been promoted to the position of Assistant Division Superintendent of the Lackawanna Division, to succeed G. P. Troutman, who has resigned to become Assistant General Manager for Markle & Co.

J. E. Baumgartner who has been for the past five years General Superintendent of eleven mines owned by the Superior Coal Co., of Wellston, Ohio, has resigned his position, to take place after the first of the year. Mr. Baumgartner is one of the youngest superintendents in the state and has worked his way up from a trapper boy. He is undecided as to the future.

James Taylor, who was appointed State Mine Inspector of Illinois in 1887, by Governor Dick Oglesby, and who has served ever since with the exception of the Altgeld administration, tendered his resignation to Governor Dunne on Nov. 10. In reply the governor said. "Kindly continue to perform the duties of your office until further notice." It appears that the governor is in no hurry to displace an efficient man in a position where much depends upon experience and ability.

OBITUARY

Daniel M. Barton, general purchasing agent of the General Electric Co., died at his home in Schenectady recently after an illness of five days.

Mr. Barton was born in Moriah, N. Y., in 1843, removing with his parents to Massachusetts while still a child. In 1893 he became assistant purchasing agent of the General Electric Co. and a few years after the main office of this firm was established in Schenectady, he became general purchasing agent, which position he ably filled until the time of his death. He is survived by a wife, a daughter, three grandchildren, a brother and a sister.

RECENT COAL AND COKE PATENTS

Coal Cutting Machine. A. Scharf, 2 Westerbleichstrasse, Dortmund, Germany, 9448 of 1913.

Improvements in Coal Cutting Machines and the Like. Beckett and Anderson, 71 Lanark Street, Glasgow, Scotland, 6627 of 1913.

Improvement in the Construction of Shafts for Coal Mines and the Like. T. E. Harris, 20 Peugam Street, Peugam, South Wales, 24,764 of 1912.

An Improved Apparatus for Testing Gas with Miners' Safety Lamps. W. Baxter, Priory Road, Bolten-upon-Dearne, near Rotherham, 27,264 of 1912.

CONSTRUCTION NEWS

Kittanning, Penn.—A small corporation to be known as the Mohawk Mining Co. has taken over the coal under the Miller farm in East Franklin township and will mine the same.

Kittanning, Penn.—Work is now under way extending the line of the West Penn interests to the mines of the Providence Coal & Coke Co. at Kelly Station for the purpose of electrifying the entire plant.

Marion, Ill.—The Scranton and Big Muddy Coal and Mining Co. has just installed a Sullivan compound straight line compressor, size 24x26x16½x30 in. This machine has been erected to operate 22 mining machines.

Shadyside, Ohio—The Webb mine of the George M. Jones Coal Co. is being put into shape for producing a large amount of coal as rapidly as possible. Entries are being driven and the coal is now being produced at the rate of from 40 to 50 cars each week.

Somerset, Penn.—Mines have been opened at six different points near Central City within the recent past, the largest being those of the Berwind-White and Loyalhanna Coal Co. The railroad tracks will be extended to the new operations inside of a few weeks.

Mt. Carmel, Penn.—Residents of Girardville and Ashland are much pleased over the prospects for the new breaker which will be erected by the Lehigh Valley Coal Co. at Packer No. 5 Colliery, which is located about a mile east of Girardville at Rappahannock.

Cleveland, Ohio—An order has been placed with the Great Lakes Engineering Co. for a 10,000-ton steel freighter to take the place of the ill-fated Charles S. Price which was destroyed Nov. 9 in the disastrous lake storm. The boat will be ready for service in the spring.

Kittanning, Penn.—Another coal mine will be added shortly along the lines of the Pittsburgh, Shawmut & Northern Ry. system. James H. Corbetts, contractor, of Kittanning, has secured one thousand acres of coal land at Timblin and the construction of the necessary mine buildings will be begun shortly.

Pottsville, Penn.—A special meeting of the shareholders of the Shamokin Valley & Pottsville R.R. will be held on Dec. 26 to authorize the proposed conveyance to the Susquehanna Coal Co. of the reversionary interests of the company in certain coal lands now leased by the Mineral Railroad & Mining Co.

Martins Ferry, Ohio—The Pursglove-Maher Coal Co. is arranging for another opening to its Black Diamond mine at Neffs. This opening will be in a hollow to the east of the tipple and will take care of the coal under the James Dixon farm. It will not require a new tipple or extension to the railroad tracks, as the mine tramway will be laid from the mouth of the new mine to the present tipple.

Caney, Kan.—It has been announced that work on the proposed Cherryvale, Oklahoma & Texas will begin in January. The road will run through the Oklahoma coal fields and give operators of that section an outlet which has hitherto been obtained under difficulties. About 40 miles of the new road already has been graded between Caney, Kan., and Vinita, Okla. The 61 miles of road to connect those cities will be built at once.

NEW INCORPORATIONS

Cleveland, Ohio—The Short Creek Coal Co. has increased its capital stock from $600,000 to $1,000,000.

Chattanooga, Tenn.—The Four-Mile Coal Co. has been incorporated with a capital stock of $30,000 to develop coal properties.

Hamilton, Ohio—The Murdoch Coal Co. has filed papers with the secretary of state increasing its capital stock from $10,000 to $20,000.

Huntington, W. Va.—The Bengal Coal Co. has been incorporated with a capital stock of $100,000 to develop coal lands near Man, W. Va.

Cleveland, Ohio—The Roby Coal Co., of Cleveland, Ohio has filed papers with the secretary of state increasing its capital stock from $800,000 to $2,000,000.

Uniontown, Penn.—The Cheat Haven Coal & Coke Co. has reorganized under the name of the Fancy Hill Coal Works. Many improvements in the existing plant are contemplated.

Centralia, Ill.—The Wizard Coal Co. has been organized with a capital of $5000 to mine, buy, sell and deal in coal. The incorporators are Frank F. Noleman, F. Kohl, Walter Eis, Harry Kohl, and F. A. Hartman.

Fort Smith, Ark.—The E. D. Bedwell Coal Co. has been organized with a capital of $50,000, all of which has been subscribed. E. Bedwell is president, T. A. Ball, vice-president, and S. H. Abbott secretary-treasurer.

Belleville, Ill.—The Victoria Coal Co. has been incorporated with a capital of $60,000 for the purpose of mining and dealing in coal and other minerals. The incorporators are L. Senior, John Henderson, and G. M. Henderson.

Bluefield, W. Va.—The Sandy Ridge Coal & Coke Co. has been organized at Bluefield with a capital stock of $50,000. The incorporators are E. E. Carter, G. R. Carter, J. H. Carter, and L. Ray, of Bluefield, and W. V. and R. S. Hansel, of McDowell, Va.

Chicago, Ill.—The Midland Counties Coal Co. has been organized in Chicago with a capital stock of $5000 to do a general mining and manufacturing business. The incorporators are Arthur W. Underwood, Nathan S. Smyser and Charles R. Young.

Birmingham, Ala.—The Nunley Ridge Coal Co., with a capital stock of $24,000, has been incorporated with the following officers: R. D. Curry, president and treasurer; H. E. Mc-

Cormack, vice-president and secretary. The offices of the company will be located at Birmingham.

Baltimore, Md.—The Bridgeport Gas Coal Co. has been organized with a capital stock of $60,000 to acquire and deal in coal lands. The principal owners are Aubrey Pearre, Sifford Pearre, Aubrey Pearre, Jr., of Baltimore; John Lowe, of Shinnston, and Gordon Lake, of Independence.

Eugene, W. Va.—The Mingo Washed Coal Co., of Mingo County has been incorporated to mine coal and manufacture gas. The authorized stock is $20,000, and the incorporators are as follows: Harvey Cory, of Pittsburgh, Robert L. Martin, Jr., Maurice A. Songer, of Eugene, J. H. Greene and B. M. Good, of Williamson.

Bluefield, W. Va.—The Appalachian Coal Land Co. has been incorporated with a capital stock of $100,000 ($25,000 seven per cent. cumulative preferred, and $75,000 common) with the following officers: R. S. Ord, president; Bernard McClaugherty, vice-president; W. S. Patterson, secretary and treasurer; J. Elliott Hall, general manager; and T. M. Morrison, chief engineer.

INDUSTRIAL NEWS

Johnstown, Penn.—A Baldwin-Westinghouse locomotive in Lochrie's mine below Scalp Level recently handled 900 tons of coal in one day of 9½ hours.

Evansville, Ind.—Henry F. Allen, of Pittsburgh, representing capitalists of that city who have made arrangements to merge several of the largest coal mines in western Kentucky has leased the building at First and Main Streets for offices.

Connellsville, Penn.—The Baltimore & Ohio R.R. Co. recently began tests on coke breeze for firing engines on the Connellsville division. Officials of the general offices witnessed the tests which are said to have been successful. This fuel is used in the new automatic stoker locomotives.

Barbourville, Ky.—John G. Matthews recently sold his interest in the Ely Jellico Coal Co. to other stockholders in the same concern. This company has during the past ten years paid dividends of over 200 per cent. Mr. Matthews is opening a new mine in the Brush Creek field in Knox County.

Marianna, Penn.—The Farmers' and Miners' Bank following the failure of the Pittsburgh-Buffalo Coal Co. with which it was affiliated has been closed, and its affairs turned over to the bank examiner. It is a state institution with a capital of $50,000, deposits of about $100,000, and a reserve of $5000.

Martins Ferry, Ohio—Mrs. Frances Crymble has sold 50 acres of coal to the Loraine Coal & Dock Co. for $200 per acre, the deal being closed recently. This coal lies close to the Lansing mine of the company and can be easily taken out. This price is several times what is usually paid for coal in Belmont Co.

Philadelphia, Penn.—The Collier "Hampden" built for the Coastwise Transportation Co., of New York, which will be used in carrying coal along the Atlantic coast was successfully launched from the Camden plant of the New York Shipbuilding Co. on Dec. 15. The craft which has a tonnage of 7000 will be completed in about six weeks.

Washington, D. C.—All Illinois members of the House of Representatives recently received telegrams from the head of the labor movement in that state urging an immediate investigation of the Colorado coal strike and the Michigan copper strike. It is rumored also that strong hints of the need for action had also come from the cabinet.

Punxsutawney, Penn.—As the result of a walk-out of miners at the Adrian mine near here, who demanded a closed shop, the Rochester & Pittsburgh Coal & Iron Co. on Dec. 17, closed down the mine indefinitely. Over 500 miners are affected and the coal company's action followed an announcement that the operators would handle trouble independently and not as an association.

Charleston, W. Va.—Shipments of West Virginia coal and coke over the Norfolk & Western Ry. for the month of November amounted to 3,597,002 tons of which 93,036 tons were coke. Pocahontas coal constituted 2,383,308 tons, while all the coke came from this field. The balance of the month's shipment came from the Tug River, Thacker and Kenova fields.

Washington, D. C.—An advance of 10c. per ton or proportional rates on coal from mines in Kentucky and West Virginia to Milwaukee, Manitowac and Kewaunee, Wis., by way of the Pere Marquette R.R. and car ferry was allowed Dec. 19 by the Interstate Commerce Commission. The maintenance of through routes to points on the west shore of Lake Michigan was ordered continued.

Harrisburg, Penn.—The Public Service Commission has received word from the experts who are investigating for the commission the rates of transportation of coal from the Anthracite regions to Philadelphia, that the preparation of their report is sufficiently advanced for them to give assurance that it will be completed and in the hands of the commission not later than February first.

Camden, N. J.—Word was recently received at the headquarters of the Camden Coke Co. in Camden from Trenton, N. J., that Chancellor Walker had refused to modify his order directing the company to abate an alleged smoke nuisance within six months or close its plant at Mt. Vernon and Chestnut Streets. It is believed that this mandatary order of the court will work great hardship upon the plant management.

Morgantown, W. Va.—The North American Coal Co., of West Virginia has closed an agreement with James A. Comley, of Morgantown, for the development of a tract of one hundred acres of coal on the Monongohela River, and along the Buckhannon & Northern R.R. The contract provides for the operation of all three veins of coal, the Pittsburgh vein being most important. The operating company has option for the purchase of the property.

Edmonton, Alberta—The Alberta Coal Branch line of the Grand Trunk Pacific Ry., 37 miles in length, is now complete, affording transportation facilities for the output of the Mountain Park Coal Co. This mine is now producing 500 tons daily, which it is expected will be increased by April next to 2500 tons. The company has erected 50 houses and established a colony of English and Scotch miners. It is proposed to increase the force to 800 men in the near future. The coal is a high-grade bituminous.

Cincinnati, Ohio—Cincinnati coal dealers and steamboat companies are opposed to Senate Bill No. 136 known as the La Follette Seaman's bill as it is believed this measure is detrimental to local river interests. It is understood that the bill provides for the employment of three crews on all river steamboats instead of two as now required, and it is alleged that this would mean that practically every boat on the river would have to be rebuilt, as none of them are now large enough to accommodate more than two crews.

Philadelphia, Penn. — The mild weather thus far this winter has caused anthracite coal operators of Pennsylvania much money expended for the storage of coal. Only a limited amount can be kept on hand at tide-water, and the rest has to be cared for in the anthracite region itself. It has been estimated that as much as 10 per cent. of the total annual production or nearly 7,000,000 tons are in storage at one time. It is neither expedient nor possible to make the operation of the mines dependent upon the state of the weather.

Columbus, Ohio—The mid-winter meeting of the Michigan-Ohio-Indiana Coal Association will be held at Indianapolis Jan. 20-21. Routine matters will be discussed and steps will probably be taken toward fixing a place and time for the 1914 convention. The association is in good condition as to members and finances and B. F. Nigh, secretary has taken up the settlement of claims against railroads for the members and has been highly successful in this work. The amount collected in 1913 is far in advance of that collected during previous years.

Fort Smith, Ark.—J. L. Rhodes electrician was granted a verdict of $1000 and his assistant, D. Hatcher, a verdict of $375 against the Central Coal & Coke Co., of Hartford, by a jury recently. The men sued for $3000 damages each, for injuries which they alleged to have received when they were sent into a mine to make repairs. While they were in the workings the ventilating fan stopped, and their lanterns ignited gas. Since the explosion 200 men employed in the mine refused to return to work because the company has declined to place an extra guard at the fan house to keep the fan in operation at all times.

New Orleans, La.—Owing to the low stage of water on the Warrior and Tombigbee Rivers, the first regular trip of the barge service between this city and the Alabama coal field was not an unqualified success. It has been proven, however, that the barges will be able to navigate the upper rivers with facility, once locks and dams are completed. With the coming of the winter rise several months of deep water are assured. During this time it is expected that a considerable tonnage of coal will be brought to New Orleans by the water route. The power barges will at least have a fair chance to demonstrate what they will be able to do, and upon the result of their performance depends the possible readjustment of market conditions in New Orleans.

COAL TRADE REVIEWS

GENERAL REVIEW

Entire absence of the customary holiday rush for anthracite. Rumors that some coal is even going into storage. Further recession in bituminous.. All markets have lost ground sharply during the week. Some relief anticipated as a result of the restricted production over the holidays.

While ordinarily the holiday period finds an acute shortage of anthracite and a heavy rush of business, the situation this season is completely reversed. The accumulations of coal at the principal distributing centers are so excessive that the companies are welcoming the opportunity for a cessation of operations, while usually the operating departments are being pushed for ever possible ton that can be produced at this time. The individuals are maintaining a full working schedule, but are forcing the market, and as a result substantial concessions on the regular circular are frequently heard of. There are well defined rumors that the companies are stocking 10 per cent. of their production.

A break of 5c. in the Hampton Roads circular on high-grade West Virginia coals, putting these desirable fuels on a basis 5c. off from the regular circular maintained throughout the summer, may be taken as typical of the condition of the soft coal trade at the moment. All markets as a rule are well stocked, and operators are anxiously soliciting new spot business; those who failed to contract in anticipation of a high price level by Jan. 1, are now finding themselves in a difficult position. There are no indications of a rally as yet and conditions are tending more toward a further shading off. But in spite of all the adverse conditions, prices are remarkably well maintained, a fairly profitable price level ruling, with but little sacrificing of demurrage coal in evidence. The anticipated curtailment in production over the holidays is having a steadying effect upon the situation, and will tend to relieve the pressure on the market after the first of the year.

Domestic coal in the Pittsburgh district is reported the dullest in years. The market lost ground decidedly during the week, steam consumption falling off in all lines and prices irregular; some slight improvement in Connellsville coke is the only encouraging feature in the local situation. The market in Ohio is at a complete standstill with dealers loaded up to the full limit of their storage capacity, and mines working under a heavily curtailed schedule. Some contracts are being renewed at last year's figures, and the possibility of labor troubles in April is having a beneficial effect upon the prices at which this business is being done. Dumpings at the West Virginia piers ran good during the week. The Southern market is dull, insofar as new business is concerned, though consumers continue taking regularly on contracts. The usual holiday rush business has failed to develop and coal is accumulating in the local railroad yards for the first time this year.

The Middlewestern market is regarded as the worst for this period in years. Cars are plentiful, and railroads have accumulated surplus stocks and are beginning to cut down orders. As in the East, however, prices are being held better than conditions seem to warrant, the principal cutting being confined to coal on demurrage. The Western markets are exceedingly easy in spite of the Colorado labor trouble.

EASTERN MARKET

BOSTON, MASS.

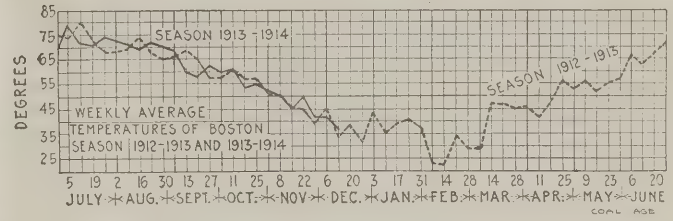
Bituminous quiet and softer. Inquiry for spot coal has ceased and contract demand reduced. Georges Creek remains firm and Pennsylvanias are quiet for tidewater shipment through fairly active all-rail.

Bituminous—There is no material change in the market. The well stocked condition of New England consumers has made the demand for shipment on contracts light and the shippers of New River and Pocahontas are anxious to the extent of actively soliciting spot business. The accumulation of coal at Hampton Roads loading piers has been substantially enlarged and the circular price of $2.85 f.o.b. has been shaded, New River coal having been openly quoted in this market at $2.80. Many are inclined to believe that January will be a particularly dull month for soft coal.

The situation on Georges Creek remains unchanged. This coal continues in good supply, but with the price firm. Pennsylvania coals for tidewater shipment are in little demand due the excessive supply of the Southern grades. The situation at Hampton Roads does not so materially affect all-rail shipment of the Pennsylvania coals. The market is now quotable as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahonta New River
Mines*	$1.00@1.55	$1.25@1.60	$1.67@1.77	
Philadelphia*	2.25@2.75	2.50@2.85	2.92@3.02	
New York*	2.55@3.05	2.80@3.15	3.22@3.32	
Baltimore*			2.80@2.90	
Hampton Roads*				$2.80@2.90
Boston†				3.72@3.82
Providence†				3.72@3.87

*F.o.b. †On cars.



Anthracite—The continuance of warm weather has made this market most inactive. Stove coal appears to be in as poor supply as ever.

The marine freight market remains without change, charters for New England being limited. This ruling rates from Hampton Roads to Boston are 70@75c.

NEW YORK

Under the influence of continued adverse weather and industrial conditions, market remains dull and heavy. Bituminous prices holding remarkably firm. Anthracite dealers overstocked. General curtailment over the holidays.

Anthracite—Mild weather conditions this past week has caused quite a slump in anthracite sales, although comparing the temperature between 1912 and this year there is little variance. Dealers are overstocked and in many instances, if possible, avoid purchasing coal until the new year. Egg coal was held by numerous individuals at 50c. to 60c. off circular and some found it difficult to move even where an equal quantity of stove coal accompanied the egg. Straight stove brought small premiums of 10 to 20 cents. Nut coal in some instances, particularly in the Lehigh grades, sold at 10c. off circular; this size being popular with the peddlers in the free burning grades moved promptly. Pea size continued in fair demand, although buckwheat was plentiful and hard to move even at cut prices. Schuylkill rice is strong, but barley remained inactive. The same condition applied to the Wyoming grades of steam sizes.

From an authentic source it is learned that at the present time the large companies are stocking 10% of their production, which naturally indicates a lack of sufficient orders on hand. The new demurrage rules at all the tidewater points prohibit the holding of coal for an indefinite period and for that reason the companies will have to resort to stocking coal on the ground, which is an expensive proposition, particularly on the prepared sizes due to the breakage in handling. The Reading Co. collieries will be shut down three days a week during the holiday season, and no doubt the same conditions will apply to the Wyoming region. This will materially help conditions all around by Jan. 1.

We quote the New York market on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	....	$5.05	
Egg	5.25	$5.25@5.35	5.30	$4.75@5.20
Stove	5.25	5.25@5.40	5.30	5.20@5.35
Chestnut	5.50	5.40@5.50	5.55	5.35@5.45
Pea	3.50	3.40@3.50	3.50	3.35@3.45
Buckwheat	2.75	2.70@2.75	2.45@2.70	2.25@2.70
Rice	2.25	2.25	1.95@2.20	1.80@2.20
Barley	1.75	1.60@1.75	1.70	1.40@1.70

Bituminous trade still remains dull and the tendency toward curtailment by the manufacturers throughout the East, with the exception of some few lines, does not portend much better conditions for the immediate future. The shipments of soft coal have been unusually heavy throughout the season, the contractors taking their supplies freely and the movement on the regular contract tonnage continues in fair volume. Those of the operators who thought it better to keep their tonnage free have found that instead of the high market they expected by Christmas time, an entirely contrary condition obtains.

The decided slump of the market in the West has caused a number of West Virginia operators to look to the East for their market, and this has overtaxed the absorptive power of the market. There is considerable accumulation of coal at tide, a general embargo having been placed on the Pennsylvania R.R. Co., at South Amboy, on Saturday last. The remarkable feature, however, is the fact that in spite of the heavy tonnage available, prices are comparatively well maintained. There appears to be little real sacrifice in the movement of demurrage coal such as one might naturally expect under the conditions. The market is quotable as follows:

West Virginia steam, $2.60@2.75; fair grades of Pennsylvania, $2.70@2.80; good grades of Pennsylvania, $2.80@2.90; best Miller Pennsylvania, $3.10@3.20; George's Creek, $3.15@3.25.

PHILADELPHIA

Hard coalers forced to curtail production. A customary season of short supplies and heavy demand finds large surpluses available, and market dull. Individuals cutting the circular freely. Tidewater points crowded with coal.

It is now either a case of restricted mining, or large demurrage bills on account of coal held in cars without disposition, and the companies, recognizing this fact have resorted to a restriction of mining. This is most unusual at this period of the year, when as a rule, the holiday season is looked on with apprehension, because of decreased shipments, but it looks now as though the closing of the year will find the market in the throes of a general slump. This is due to the weather, which has been anything but propitious. Outside of stove coal there does not seem to be any active market at all, and with all grades piling up on their hands, and no outlet in sight, the companies have anticipated the season's restricted output by a general curtailed mining.

Individual operators, who continue to run their mines, are forcing a market for their output by quoting prices that must sell the coal. Fifty cents off circular for egg is about the lowest quotation to date, with more to come if further holding of the coal involves demurrage. It is understood that tidewater points are crowded with coal, and while this branch of the business has held its own for the last six months, there are indications that too much cannot be expected of it, and if conditions do not improve in the New England market, there is likely to be considerable demurrage paid before the coal is disposed of. Outside of broken and stove, it is simply a hand to mouth market.

The bituminous trade still shows no tendency toward improvement. Offers for spot coal are eagerly taken by the operators, if there is anything that looks like a profit over the cost of production, and this applies to even the best grades. As low as $1.25 has been quoted for the best Pennsylvania coals, and it is freely predicted that even lower prices than this are likely to prevail, if conditions do not change very shortly.

BALTIMORE, MD.

Both the bituminous and anthracite trade dull and uninteresting. Prices are too near actual production cost for comfort. Coke in poor demand.

The past week has been a most uneventful one for the trade. There has been no indication of a rally; in some cases there has been a still further shading off. In Pennsylvania, a 90c. to $1 figure, even for low-grade coals hits the mining interests hard. The same is true of West Virginia, where gas fuels sold variously during the past week from 75c. to 80c., with steam coals about ten cents better. Fine-grade Pennsylvania steam coals were offered by some producing interests around $1.20 to $1.25. The coke market is off in sympathy with the soft-coal trade. West Virginia cokes were offering as low as $1.75, with Pennsylvanias doing about 15 to 20c. better. The market is the worst for many months.

Mining interests are only operating in part through Maryland, West Virginia and western Pennsylvania. The Christmas and New Year's holidays will prevent an over-production even at the shortened time basis. The movement of anthracite to this city is said to be not two-thirds of what it was at this time last year. Unless some real winter weather arrives soon, the situation will be serious. Movement over the piers continues fair for foreign account, but there is little doing now on the domestic coastwise shipping line.

CENTRAL STATES

PITTSBURGH, PENN.

Combination of adverse conditions has caused a relapse from improved conditions noted last week. Mine operations much restricted and prices fluctuating. Prompt coke limited and market showing a slight improvement.

Bituminous—The coal market has lost ground decidedly since last report, when there had been a temporary improvement due to a cold snap, but which only proved to be of short duration. From all viewpoints the condition is unsatisfactory. Manufacturing demand grows lighter as the iron and steel industry slows down, railroad consumption falls off as the freight movement decreases, and domestic demand is poorer than it has been in any season for years. Prices are quite irregular, cutting being the rule when it is necessary to move tonnage. Sales to consumers are frequent at 10c. differential, which normally applies to dealers, making mine-run $1.20 instead of $1.30, and it is possible that in exceptional cases there has been even more cutting. Mine operations are down to about 50%, against 60% in the early part of the month. We quote regular circular prices, subject to shading, as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in. steam, $1.50; 1¼-in. domestic, $1.55, per ton at mine, Pittsburgh district.

Connellsville Coke—The market is taking on a much stronger aspect. The amount of furnace coke available at less than the $2 price asked all along by the majority of producers is proving to be quite limited and some buyers do not find desirable brands in the list. While a few transactions have been closed for next year at less than $2, the latest transaction is 12,000 tons for January, at $2. This deal reflects the attitude of many prospective consumers, who purpose buying for January alone instead of for the quarter or half year. They do not think the market will in any event advance above $2, and by purchasing for January only, the month most likely to show difficulties in coke movement, through weather conditions and the celebration of the various Greek and Russian holidays among the men, they will still have the opportunity of profiting by possible declines later. Negotiations are active with many consumers and the next few days are likely to see many contracts closed, a few for the half year, but the majority probably for January only. Prompt coke is in limited supply and is quotable at a relatively low figure only because prompt demand is almost entirely absent. We quote: Prompt furnace, $1.75; contract furnace, $1.90@2; prompt foundry, $2.50@2.75; contract foundry, $2.50@2.75, per ton at oven.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ending Dec. 13, at 307,790 tons, a decrease of 14,137 tons, and shipments at $305,845 tons, a decrease of 15,786 tons.

BUFFALO, N. Y.

Weather still adverse to any activity in the coal market. Anthracite as dull as bituminous. Mines in Allegheny Valley reducing output. Not so much soft coal on track. No improvement in sight.

Bituminous—The trade is still quiet, with shippers making a little more effort to keep the tracks clear of unsold coal. While there is still coal here and there under demurrage, it is somewhat less and if the local jobbers can control the movement the production will not be large enough to crowd the consumers for storage and reduce prices. It is not believed there will be any improvement in the trade till well into January and not then if the weather continues mild. Buffalo has the advantage in not being a terminal point, for if there is too much accumulation, the seller has a way of sending some of it further on.

While this does not ease the market to any great extent, it is quite an excusable practice where the mine is inclined to load up a single distributing center too much. Another abuse of late is to sell a lot of coal and then ship half as much more and depend on the buyer's good nature to accept the surplus. There is all of the former difficulties with the miners, who are demanding closed shop and many other conditions. But they find the operators independent as a rule, for producers feel that concessions would be fatal, in view of the spring agreements. Quotations are difficult to make, as many prices are paid and only a few getting former figures, which are $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with slack rather firmer than three-quarter. Allegheny Valley is about 25c. lower than Pittsburgh.

Coke—The coke market continues quiet, with prospects of remaining at the present low figure till there is a genuine stir in the iron trade. Prices remain on the basis of $4.60 for 72-hr. Connellsville foundry.

Anthracite—So far as actual demand is concerned, the anthracite market is fully as flat as anything else. The local consumption has seldom been as light at this time of the year. Retail dealers are making a bare living and now that the Lakes are closed—without a sign of ice—the rail line demand is not sufficient to take care of the most ordinary output, and Buffalo shipping agents are already beginning to take Lake tonnage for loading to hold on winter storage. The Lake trade closes with the shipment of 103,100 tons in December, a large amount, and 5,033,296 tons for the season, as against 3,925,083 tons in 1912.

TORONTO, CAN.

Trade duller than at any time in more than a decade.

Trade conditions show little change, sales being slow on account of the continuance of unseasonably mild weather. Dealers state that business since the beginning of November has not been so dull at this season since 1902, when similar conditions prevailed. Quotations at retail are as follows: Egg, stove and nut, $8.25; pea, $6.75; soft coal, steam, steam screenings, $4.35; domestic lump, $6; cannel coal, $7.50. Wholesale, ¾ lump, f.o.b. cars, $3.85; soft coal, screenings, f.o.b. cars, $3.

COLUMBUS, OHIO

Trade is weak in every department, due to continued unfavorable weather. Demand light in all grades and mines are being operated at about 50 per cent. capacity. Prices have weakened under the influence of unfavorable weather and the trade is not promising.

Dealers' stocks of domestic grades are large and they are unable to take care of any more coal until they can move their surplus. Customers are slow in placing orders now, believing that there may be lower prices later on. Most of the larger users have laid in their winter's supply and the trade is at a standstill. The smaller dealers are not inclined to take chances on the payment of demurrage. There is some demand for the fancy grades, such as Pocahontas and rescreened varieties.

But domestic trade is not the only branch which shows a softness. The steam business is light and many iron and steel concerns have closed down. All this affects steam grades adversely and the volume of business is comparatively small. In this connection reports of fuel used by railroads are smaller as the freight movement is decreasing. What steam contracts are expiring at this time are being renewed at the same figures that prevailed last year.

The Lake season is now over, and reports from the Hocking Valley Docks at Toledo shows that 2,747,000 tons were loaded during the season, which is an increase of more than 325,000 tons over the previous year. Production has been largely curtailed by the lack of orders and as a result mines have not been operated to their full capacity. In the Hocking Valley and Pomeroy Bend districts, the output is estimated at 45 to 50 per cent. of normal and the reports from the strictly domestic fields show a still smaller percentage. In eastern Ohio the output has been about 40 per cent. of the average.

Quotations in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump.....	$1.85 @ 1.75	....	$2.00 @ 1.85	$1.70 @ 1.60
3-4 inch............	1.65 @ 1.60	$1.20 @ 1.15	1.80 @ 1.70	1.50 @ 1.45
Nut...............	1.30 @ 1.20	....	1.65 @ 1.55	1.30 @ 1.25
Mine-run..........	1.35 @ 1.30	1.10 @ 1.05	1.30 @ 1.25	1.35 @ 1.25
Nut, pea and slack..	0.80 @ 0.75	....	0.90 @ 0.85	0.80 @ 0.75
Coarse slack........	0.79 @ 0.65	0.90 @ 0.80	0.80 @ 0.75	0.70 @ 0.65

DETROIT, MICH.

Plenty of coal and all orders promptly filled. No serious condition anticipated here during the balance of the season. Good stocks on hand.

Bituminous—The recent cold snap has developed a greatly increased demand, but supplies were good, and orders as a rule have been promptly filled. A congestion at junction points south of here, was materially relieved during the previous mild weather and the general opinion is that no serious trouble will be experienced in this direction during the balance of the winter. A falling off in the freight movement and curtailment in the general manufacturing demand have reduced the steam business materially. Contracts expiring Jan. 1, will, as a rule, be renewed on the same basis as last year. Domestic dealers have ample stocks on hand to meet almost any demand that might appear, and new orders are not plentiful. A change in the weather condition will be necessary before an active business can be expected. Prices are not materially changed, but are probably somewhat firmer. The market is now quotable as follows:

	W. Va. Splint	Gas	Hocking	Cambridge	No. 8 Ohio	Pocahontas	Jackson Hill
Domestic lump.	$1.50	....	$1.50	....	....	$2.25	$2.50
Egg...........	1.50	....	1.50	....	....	2.25	2.50
Nut...........	1.35	....	1.20	....	....	....	....
Steam lump....	1.25	....		....	....	....	....
¾-in. lump.....	1.10	$1.10	1.10	$1.10	$1.10	....	....
Mine-run.......	1.00	1.00	1.00	1.10	1.10	1.40	....
Slack..........	0.90	0.90	0.65	0.90	0.90	....	....

Anthracite—All the anthracite sizes are coming in freely and stove coal, which was decidedly short, is now in easy supply at the circular price. Indications point to a surplus of anthracite coal at the present time.

Coke—The coke market is firmer than at any time for a long period. Connellsville foundry is quoted at $1.75, Semet Solvay at $2.75, and gas house at $2.70 f.o.b. ovens. A number of the local ovens are curtailing their production.

HAMPTON ROADS, VA.

Heavy loadings for the government during the week. About normal supply of coal at tidewater. Prices practically the same as for several weeks.

Dumpings for the week have been good, the government alone taking nearly 35,000 tons. Coastwise and foreign shipments have also been fairly heavy. Prices quoted are practically the same as they have been for some time, and although some large sales have been made it is impossible to ascertain at what prices.

Coal moving during the week has nearly all been Pocahontas and New River, there being little demand for the other grades just at this time. Owing to the demand for high volatile being light, few shipments have been sent to tidewater and in consequence there is little of this coal on hand.

During the past week the N. & W. Ry., at Lamberts Point, gave their new pier a test and found everything working satisfactorily. There still remains considerable work to be done on the pier and the prospects are that it will be about the middle of January before any coal is dumped over it.

LOUISVILLE, KY.

Consumption incredibly small for the season of the year. Car shortage relieving the situation somewhat. Curtailed production over the holidays also helping out.

With every prospect for an unusually mild Christmas, the coal trade in this section is facing an unusual state of affairs. The consumption of coal has been incredibly small, and the demand has been of the same sort. The domestic grades are practically not moving at all, many operators and wholesalers, in fact, having received numerous cancellations. Coal stored during the latter part of the summer and early in the fall, for the demand which normally exists at this time, is still on hand, and there is no room for additional storage.

A car shortage is about all that saves the situation from utter demoralization; it keeps the amount of coal on the tracks from reaching the proportions which it otherwise would. The holiday lay-off at the mines will also help things considerably, and if the long-expected winter arrives by Jan. 1, or shortly thereafter, business should show a marked improvement. Until then, it is emphatically a market governed by unseasonable weather. The situation of the steam market is strikingly different from that in the domestic market. The greatly reduced production of the prepared grades has resulted in a similar reduction in the quantities of screenings available, and as most industries are operating on full time, this means something resembling a shortage on the local market.

The better grades of eastern Kentucky, such as Straight Creek, are selling at 90c. a ton, f.o.b. mines, and prospects are for still better prices soon. Western Kentucky nut and slack is worth 65 and 70c., and is in good demand. Prices for domestic sizes are not being freely quoted at much below last week's low level, operators fearing to demoralize the market, but the best grades can be had for $1.85 or thereabouts.

SOUTHERN AND MIDDLEWESTERN

BIRMINGHAM, ALA.

No improvement in coal market. Stocks accumulating in railroad yards. Blacksmith coal normal. Little activity in furnace or foundry coke. The car situation has improved.

There is no change in the coal market, either on steam on domestic coal, unless it be for the worse. The trade is now practically dead, as far as inquiries or new orders are concerned; contract tonnage is moving regularly, however, though in some instances the consumers are taking only the minimum called for. One of the large interests is offering the best Cahaba coal at $2.75 per ton, which is 50c. under the market for this season, and even then they are not moving their tonnage.

For the first time in several years, a stock of coal is accumulating in the railroad yards, which has a tendency to weaken the market. While prices on domestic coal have been reduced in the effort to obtain business for prompt shipment, prices on the steam grades seem to be holding up, though the steam market is in the same condition as the lump trade. As the market during the summer months, which is usually the dull period, was excellent, the operators are at a loss to understand the slump at this season, which is naturally the best of the year. Blacksmith coal seems to be holding up better than any of the other grades. Little activity is shown either on furnace or foundry coke, but the prices are holding up. On account of the quiet coal market, which necessarily means small shipments, the car situation shows an improvement, which is really the only satisfactory condition at the present time. The usual holiday rush shipments have, so far, failed to materialize.

NEW ORLEANS

Sales show unusually low total. Lack of demand for bunker supply. Prospects good for business after the turn of the year. Cargo outlook poor owing to low rates being named for Atlantic coast product.

The domestic market was quiet due to the return of spring weather. There were plenty of ships in port but they had either coaled last week or were waiting until next week. Total sales in the harbor were the lightest of the winter and points in the interior took little coal, due largely to the fact that taxes are assessed on supplies on hand Jan. 1.

Next week promises to be little better than the one just closed, but there are prospects of considerable business after New Year's. Stocks are believed to be limited and general replenishing will begin at once. Prospects for increased exports, so far as parcel shipments are concerned, are good. The cargo business is expected to continue quiet in the face of the low rates that are being made on coal from the Atlantic seaboard.

INDIANAPOLIS

Mild weather still prevails, cutting down consumption to a minimum. Prices are being held by closing down the mines, though some track coal has moved at bargain rates. Everybody waiting for real winter weather.

Mild weather continues and the coal trade is as small for December as it ever has been within memory of local coal men. Generally speaking, prices remain unchanged, but would be lower, if there was advantage in making them so. There is cutting of prices but this is usually on track coal, to save demurrage charges. For example, with domestic lump listed at $1.90, it is found that sales have been made even down to $1.55. There is no incentive to reduce mine prices in the present kind of weather, for the price is not the controlling factor.

The general opinion has been that the yards are necessarily filled, because of the mild weather, which made consumptive needs small but this has been disproved by a good authority. There have been two or three spells of sharp weather that looked like the real beginning of winter, and although it lasted only two or three days there was almost day and night hauling, during this time. Then came the teamsters' strike, and the retail yards of the state were never busier, probably, than for these few days.

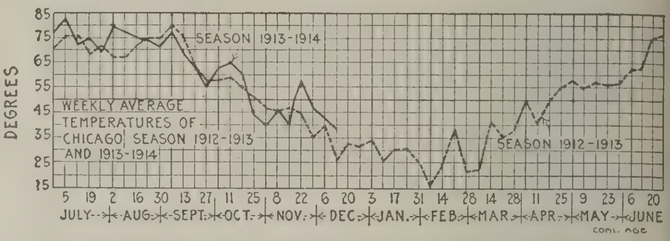
So, after all, considerable holes were made in retailers' piles. It also seems the car shortage, at the time Indiana coal begins to move, hindred the piling up of large stocks. Everybody in the coal business is waiting for winter weather. Operators that ship outside the state say the commercial department of the trade is not up to normal, but in Indiana it is hard to find the factory that is down or running below normal schedule for this time of year. The block coal field is suffering less than the others.

CHICAGO

Mild weather has resulted in a sharp decline in production. Demand for anthracite light and a comparatively small amount of smokeless coal is being moved. Nominal prices are quoted for Springfield coal. The coke market dull.

Coal-carrying roads entering Chicago announce that the continuation of mild weather has resulted in a marked decline in their tonnage. W. J. Jackson, receiver and general manager of the Chicago & Eastern Illinois says his company could handle 35% more coal than is now being offered for shipment. A sharp cut in shipments also has been reported by the Illinois Central and Big Four roads.

The coal market in Chicago, generally, is dull. Anthracite coal is in exceedingly light demand. Shipments direct from the mines have been curtailed and in some instances price reductions ranging between 25c. and 40c. a ton have been made. A marked reduction in the movement of smokeless coal has also been noted. Standard shippers have been able to obtain a price of $1.40 on a few cars of mine-run, but a majority of sales have been based on $1.25. The demand for Hocking coal is light and production is being reduced. Only nominal prices are being quoted for Springfield coal. Comparatively little domestic lump is being made and steam coal is not being sold in large volume.



There is little demand for furnace and domestic coke. Ordinary screenings command from 55c. to 65c. a ton, while some of the higher grades are being sold at from 70c. to 80c. Prices for Indiana coal are variable. A few concerns have continued to produce domestic lump coal in order to get screenings for their steam contracts and a good deal of this coal is up to demurrage in the Chicago market. It is being sold at prices varying between $1.25 and $1.60. Many of the producers have kept their coal away from Chicago and sold it where conditions are more favorable. Carterville operators are declining to accept prices offered on the open market in Chicago for spot coal and unless sales are made for shipments direct from the mines it is the practice of these producers to close down their mines. Prices for lump and egg range between $1.50 and $1.75.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump............	$2.32	$2.45@3.05	$2.27	
Steam lump..............	1.97		1.97	
Egg......................		2.45@3.05		$4.05@4.30
Mine-run.................	1.87	2.30	1.87	3.30@3.45
Screenings...............	1.42	1.75@1.85	1.27	

Harrisburg—Domestic lump and egg, $2.55@2.65; steam lump, $2.25; mine-run, $2.25; screenings, $1.65@1.75; No. 1 nut, $2.55@2.65; No. 2 nut, $2.55.

Carterville—Lump, egg and No. 1 washed, $2.55@2.65; No. 2 washed, $2.55.

Coke—Connellsville, $5.25@5.50; Wise County, $5@5.25; byproduct, egg, stove and nut, $4.90@5; gas house, $4.75@4.85.

ST. LOUIS, MO.

Car supply plentful and market overshipped. Current business worst for this period in years. Railroads well stocked.

Continued mild weather and no demand is the feature of the local market. The market on screenings has been exceptionally good. Carterville has gone up to around 60c. and Standard as high as 50c. However, the market fluctuates daily, depending upon the demand and supply. It is a heartbreaking job right now to sell any amount of lump coal, and that which is being placed is scattered in one and two carlots over a wide territory.

The dealer demand is practically nothing; all the yards are loaded, and steam trade is letting up for the holidays. There is absolutely no anthracite market. Coke is going begging, and so is smokeless.

The railroads have been stocking up quite heavily, and some of them feel that by the end of this month they will have a sufficient tonnage on hand for storage purposes, aside from their contracts. The Rock Island has been taking about 1500 to 1800 tons a day over their contracts, and are about ready to quit. Various other roads are figuring along the same lines. For the first time in many months cars are more than plentiful on all roads.

The prevailing market is:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard
2-in. lump...............	....	....	....	$1.00*
3-in. lump...............	....	...	$1.40*	....
6-in. lump...............	$1.30 @ 1.50	$2.25	1.50*	1.20*
Lump and egg..........	1.85 @ 2.15	....	....	....
No. 1 nut................	1.40 @ 1.60	....	....	....
Screenings..............	0.40 @ 0.50	....	....	....
Mine-run................	1.10 @ 1.20	....	....	....
No. 1 washed nut.......	1.75	2.25	1.40	....
No. 2 washed nut.......	1.35	....	1.60	....
No. 3 washed nut.......	1.15	....	....	....
No. 4 washed nut.......	1.05	....	....	....
No. 5 washed nut.......	0.50	....	....	....

*Asking price.

KANSAS CITY, MO.

Colder weather materially stimulated the market. Mines tuning up to greater capacity and outlook much improved.

A cold wave over Kansas and Missouri has materially improved the situation and operators are now optimistic over the outlook. Though the movement of coal has been accelerated, no change in prices is expected before the opening of the new year. At that time, a substantial advance will go into effect, provided, of course, that the cold wave proves of some duration. Demand responded quickly to the weather and dealers' stocks are rapidly being depleted. Mines have in many instances already increased their working time. The majority were only on about half time prior to the change in the weather. Domestic coal is moving better than for several months, while steam lines are even brisker than unsual. Kansas deep shaft fancy lump is quoted at $2.50, f.o.b. mines; Arkansas anthracite, $4.35; Missouri block $2.25.

OGDEN, UTAH

Western markets easy in spite of the acute labor situation. Temperatures mild and cars in plentiful supply. Labor trouble in Colorado not liable to affect the Wyoming markets.

Cold weather is still confined to Denver, Cheyenne and immediate territory, with warm days and temperate nights in eastern Nebraska, Utah, Idaho, Washington and Nevada. Most of the operators in Wyoming and Utah are short of lump orders and are carrying a surplus of nut coal on track at the mines. Coal dealers throughout the territory are buying in limited amounts and nothing but a good storm can improve the present market conditions.

During the past week the mines at Rock Springs, Wyo., were bothered with a car shortage, and two days were lost. This condition reduced the amount of slack and steam coal and for a short period there was a "flurry" in the steam market, as the sugar factories are still consuming large quantities of this grade of coal. During November the Rock Springs district sent quite a large tonnage to Denver, but conditions have changed so that it is hardly probable Denver will need the assistance of Wyoming mines in order to be supplied with coal. The severe snow storm of two weeks ago injured, rather than helped, the coal situation. Hardly a commercial order was delivered in Denver from Dec. 1 to 13. This caused a conjestion and Denver is now flooded with coal. It is estimated there is sufficient coal to last thirty days.

While the market in Utah and Idaho shows a very slight improvement, the conditions east of Wyoming are becoming more discouraging. It is reported the mines in northern Wyoming are only working two and three days per week on account of the weak condition of the Nebraska market.

The mines in the strike zone are working 45 to 55% capacity with a large portion of the coal being consigned to Denver as the market in Kansas is weak. California shows a slight improvement due to rains and while the market is weak, a few shipments are being made to this district.

Owing to weak condition of the market in Nebraska, quotations have eased off and are now:

	California	Colo. & Neb.	General
Lump	$3.00@3.50	$3.00	$2.75
Nut	2.50@3.00	2.00	2.25
Mine-run	1.85	1.85	1.85
Slack	1.00	1.00	1.00

PRODUCTION AND TRANSPORTATION STATISTICS

VIRGINIAN RAILWAY

The total shipments of coal over this road for October of the current year were 476,482 tons as compared with 338,518 tons for the same month last year. For the ten months to Oct. 31 of the current year, the shipments were 3,768,423 tons as compared with 2,860,739 tons for the same period last year.

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for August and the first eight months of the years 1912 and 1913:

State	August		Eight Months	
	1912	1913	1912	1913
Missouri	123,603	178,949	1,879,873	1,799,206
Kansas	408,947	451,968	3,203,861	3,586,093
Arkansas	172,090	178,904	1,205,149	1,205,005
Oklahoma	232,768	289,949	1,814,957	2,225,922
Totals	1,027,408	1,099,770	8,103,840	8,816,226

FOREIGN MARKETS

GREAT BRITAIN

Dec. 12—It is still difficult to obtain supplies owing to the full state of colliery order books for December and early January. Quotations are approximately:

Best Welsh steam	$5.04@5.16	Best Monmouthshires	$4.44@4.50
Best seconds	4.86@4.98	Seconds	4.08@4.20
Seconds	4.68@4.80	Best Cardiff smalls	2.64@2.76
Best dry coals	4.56@4.80	Seconds	2.52@2.64

The prices for Cardiff coal are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, exclusive of wharfage, and for cash in 30 days.

British Exports—The following is a comparative statement of British exports for November and the first 11 months of the last three years, in long tons:

	November		11 Months		
	1912	1913	1911	1912	1913
Anthracite	268,098	255,959	2,233,164	2,316,909	2,726,983
Steam	4,529,410	4,322,462	42,863,716	42,429,063	49,030,578
Gas	958,261	936,829	9,594,122	9,730,410	10,547,038
Household	156,401	140,129	1,374, 219	1,497,808	1,635,335

DIVIDENDS

Lykens Valley R.R. & Coal—Dividend of 2% payable Jan. 2, to holders of record Dec. 15.

Mahoning Coal R.R—Dividend on the common stock of $5 payable Feb. 2 to holders of record Jan. 9, and $1.25 on the preferred payable Jan. 1 to holders of record Dec. 20.

Mine Hill and Schuylkill Haven—Dividend of $1.25 payable Jan. 15 to holders of record Dec. 20 to Jan. 14.

Reading Co.—Regular quarterly dividend on the common stock of 2% payable Feb. 12 to holders of record Jan. 26.

Central Coal & Coke Co.—Regular quarterly dividend of 1½% on the common, and 1¼% on the preferred both payable Jan. 15 to holders of record Jan. 1 to Jan. 15.

Island Creek Coal Co.—Regular quarterly dividend on the common of 50c. payable Feb. 2 to holders of record Dec. 23, and regular quarterly on the preferred of $1.50 payable Jan. 1 to holders of record Dec. 23.

FINANCIAL DEPARTMENT

Reading Company

The Reading Co., reports, in part, for the year ended June 30, 1913 as follows:

The combined income account of the Reading Co., the Philadelphia & Reading Railway Co., and the Philadelphia & Reading Coal & Iron Co. compares as follows:

	1913	1912	1911	1910
Gross	$102,822,823	$89,390,135	$88,731,631	$87,768,252
Exports and imports	73,079,811	66,734,124	65,104,651	61,954,341
Net	29,743,012	22,656,011	23,626,980	25,824,911
Fix. chgs.	14,643,138	14,573,797	15,691,274	15,048,842
Surplus	*15,099,874	8,082,214	7,935,604	10,776,069

Reading Co. dividends and sinking fund charges were:

	1913	1912	1911	1910
1st pfd. div.	$1,120,000	$1,120,000	$1,120,000	$1,120,000
2d pfd. div.	1,680,000	1,680,000	1,680,000	1,680,000
Com. stk. div.	4,900,000	4,200,000	4,200,000	4,200,000
Gen. mtg. sk.fd.	502,193	508,513	459,649	433,345
	$8,202,193	$7,508,413	$7,459,649	$6,333,345
Sur. after divs.	**$6,897,681**	**$573,801**	**$476,055**	**$4,742,724**

*Equivalent, after deduction of $502,193 for the general mortgage sinking fund, to 4% on the $28,000,000 first preferred stock, 4% on the $42,000,000 second preferred stock and 16.9% on the $70,000,000 common stock. This compares with 6.8% in 1910-11 and 10.8% in 1909-10.

	1913	1912	1911	1910
Receipts	$40,983,063	$35,733,652	$34,390,139	$33,217,936

Fixed charges and taxes	5,258,331	5,572,375	4,866,586	4,798,595
Surplus	4,261,676	2,401,800	3,708,613	4,215,195

† Does not include dividend paid by the Philadelphia & Reading Railway Co.

The accumulated surpluses of the three companies June 30, 1913, were as follows:

Reading Company—		
*Surplus year ended June 30, 1913	$10,633,930	
Less dividends paid and sinking fund	8,202,193	
Surplus for year	2,431,737	
Previous surplus June 30, 1912	22,404,725	
Surplus as of June 30, 1913		$24,836,461
Philadelphia & Reading Railway—		
Surplus year ended June 30, 1913	$9,698,607	
Less dividends, etc.	6,904,501	
Surplus for year	$2,794,106	
Previous surplus, June 30, 1912	8,765,980	
Surplus as of June 30, 1913		$11,560,086
Philadelphia & Reading Coal & Iron Co.		
Surplus year ended June 30, 1913	$1,139,592	
Surplus as of June 30, 1912	1,459,694	
Surplus as of June 30, 1913		$2,599,286
Total three companies June 30, 1913		38,995,833

*Include $6,372,255 dividends from P. & R. Ry. Co.

In connection with the surplus of Reading Co., the directors have taken the following action:

On the first preferred stock, a quarterly dividend of 1% was declared, payable Sept. 11, 1913, and the sum of $840,000 was set apart to make provision for further quarterly dividends upon that stock: 1% payable Dec. 11, 1913; 1% payable Mar. 12, 1914; 1% payable June 11, 1914.

As to the second preferred stock, a quarterly dividend of 1% was declared, payable July 10, 1913, and the sum of $1,260,000 was set apart to make provision for the following additional quarterly dividends upon that stock: 1% payable Oct. 9, 1913; 1% payable Jan. 8, 1914; 1% payable Apr. 9, 1914.

On the common stock, a quarterly dividend of 2% was declared, payable Aug. 14, 1913.

The dividends paid during the year were the regular quarterly dividends at the rate of 40% per year on the first and second preferred stocks and two quarterly common dividends of 1½% each, and two of 2% each, making a total of 7%, the common stock having been raised from a 6% to an 8% annual basis during the year.

President George F. Baer says as follows:

The gross receipts of the Coal & Iron Co. increased $5,249,410 during the past fiscal year as compared with the previous fiscal year, and the expenses increased $2,583,606, a net increase of $2,665,803.

The net decrease of the fixed charges and taxes of the three companies for the year ended June 30, 1913, as compared with the year ended June 30 1912, was $11,472.

The tonnage of anthracite coal carried increased from 11,224,945 tons in 1911-1912 to 12,860,092 tons in 1912-1913, a gain of 1,635,147 tons, or 14.57%, and the tonnage of bituminous coal increased from 14,806,222 tons to 16,115,417 tons, a gain of 1,309,194 tons, or 8.84%. The revenue from traffic increased from $19,123,327 to $22,060,057, a gain of $2,936,729, or 15.36%.

The Philadelphia & Reading Coal & Iron Co.

The total production of anthracite coal from the lands owned, leased and controlled by the Philadelphia & Reading Coal & Iron Co. for the year ended June 30, 1913, was 12,807,996 tons, as compared with 10,098,831 tons mined during the previous year, an increase of 2,709,165 tons, or 26.83%. During the year the company mined 11,089,742 tons, an increase of 2,418,729 tons, or 27.89%; purchased 524,574 tons, a decrease of 116,697 tons, or 18.20%, and sold 10,478,603 tons, an increase of 553,912 tons, or 5.43% as compared with the previous year. On May 1 the umpire appointed by the board of conciliation to settle the claim of employees for an additional amount of wages due under the sliding scale percentage, decided in favor of the men. Under this award the company will pay to its employees the sum of $106,486.

The total sum expended for improvements during the year and charged to expenses was $1,241,070 as against $839,742 the previous year. The Philadelphia & Reading collateral sinking fund loan has been reduced by the payment of $30,000, for which this company has been reimbursed by the Reading Co. The increase of receipts from the sale of anthracite over last year was $5,057,056; the increase in receipts from sale of bituminous and other sources was $192,353, making an increase in gross receipts of $5,249,410 as compared with previous year. The increase in expenses, excluding the amount expended for improvements, amounted to $2,182,278. Cost of transportation of coal by rail and water during the year was $10,093,802 as compared with $7,700,695 last year.

Imitation the Sincerest Compliment

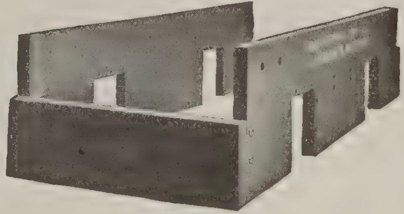
Rolled Steel Slabs used in Jeffrey Locomotive Frames, (now demanded for Mining Service) is a **Distinct JEFFREY IDEA.**

These Steel Slabs have been in

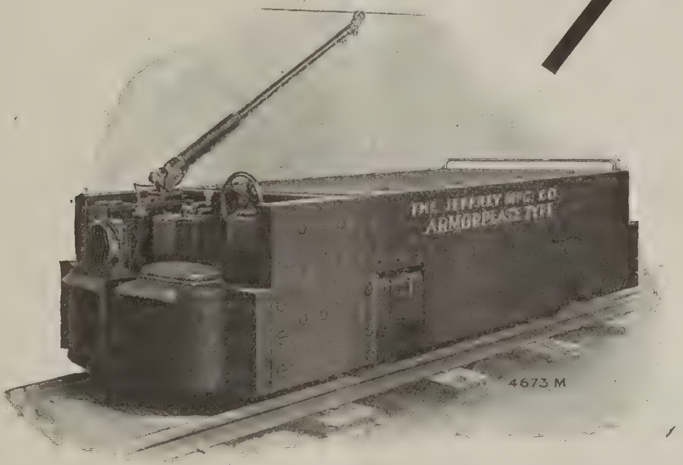
JEFFREY *ARMORPLATE*

Type Mine Locomotives for over four years.

This type of frame is indestructible; permits the largest motor capacity for a given weight of locomotive; makes all parts accessible.



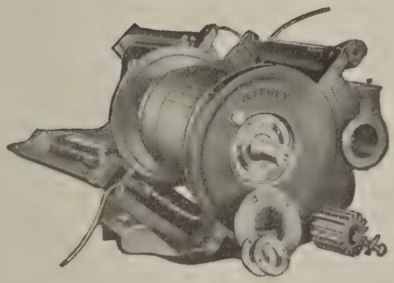
The *ARMORPLATE* Type Locomotive was conceived and developed by the Jeffrey Manufacturing Company to meet the growing demand for SAFETY and ECONOMY in Mine Haulage.



All the latest and best features in Design and Construction are found in Jeffrey Mine Locomotives and Coal Cutters.

Years ago we demonstrated that the over-motored locomotive was the only successful one.

The First Ball Bearing Armatures (the eliminators of 90% of motor troubles) were introduced on Jeffrey Mine Locomotives several years ago.



If you want more complete information, send for our New Mine Locomotive Catalog No. 117. Sent only on request.

REPAIRS MADE WHILE UNDER WORKING PRESSURE

No need to shut down your plant. Ferrobestic can be applied while the boilers are under full pressure.

Read what the Chief Engineer of the S. S. Brazos, New York and Porto Rico S. S. Company, New York, says about Ferrobestic.

> June 23, 1913
>
> Dear Sir:—
>
> I have found the test pieces which you put on our boilers, July, 1912, just as sound as when applied. Not only does it keep the iron clean and free from corrosion, but I find it very handy for patching where the other covering is broken off, and this can be done by our own fireman. I would like to see the whole eight boilers treated with the compound. I use it every place I can.
>
> Yours truly,
>
> (Signed) R. P. Browne.

FERROBESTIC

is a liquid binder for asbestos and metal. It is applied with a brush the same as ordinary paint and works perfectly on the hottest surfaces. As it dries instantly, one coat can follow the other without loss of time. One gallon is sufficient to give three complete coats to 115 square feet of surface and as there is no re-inforcing or binding material needed, one man can accomplish as much in one hour using Ferrobestic as would require almost a whole day working under the old-fashioned methods.

Jarring, vibration and water hammer or any condition to which boilers and steam pipes are subjected will not affect the insulation put on over a foundation of Ferrobestic.

Sample Free on Request

If you have an undesirable boiler to lag or a section of pipe that you have trouble keeping covered, this free sample will help you solve the problem. The attached coupon is for your convenience—use it to-day and judge the merits of our claims for yourself.

Ferrobestic is guaranteed satisfactory to the user—try it at our expense.

American Made for American Trade

The complete success of New Departure Ball Bearings in meeting the demands of the American market for a bearing of quality, capacity, efficiency, and durability, is attested by the fact that two thousand skilled mechanics are operating ten and one-half acres of modern machinery, producing ten thousand ball bearings per day.

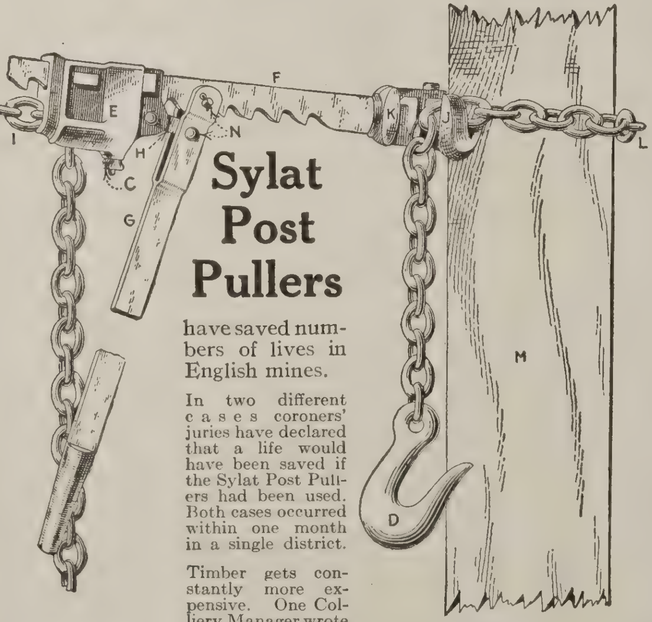
New Departure Guaranteed Ball Bearings

The ball type of bearing has no equal as an eliminator of friction. The New Departure Double Row (combined radial and thrust) is especially adapted for service in mining locomotive motors and mining car wheels.

Ask us for special mining-purpose data.

The New Departure Mfg. Co., Bristol, Conn.

What is a Man's Life Worth?



Sylat Post Pullers

have saved numbers of lives in English mines.

In two different cases coroners' juries have declared that a life would have been saved if the Sylat Post Pullers had been used. Both cases occurred within one month in a single district.

Timber gets constantly more expensive. One Colliery Manager wrote his mine had saved cost of machine in a single day where a roadway of old posts had to be cleared.

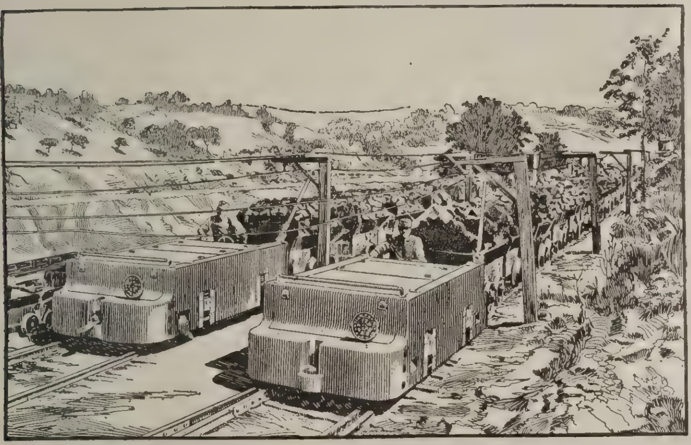
9/10

Think of putting to flight nine-tenths of your upkeep bills on mine locomotives!

Yet you can do it—by doing away with the CAUSE of the breakdowns, which is simply the plain-bearing armature shaft. You've got to DO AWAY WITH WEAR on that shaft, which you can accomplish by specifying it be fitted with

HESS-BRIGHT BALL BEARINGS

Built for Endurance



Hess-Brights on the armature shaft assure permanently perfect air gap; assure that the armature rotates on an exact center without vibration; do away with lubrication and grit trouble, all of which make up nine-tenths of the reasons for locomotive breakdowns.

Tell your locomotive builder to put ball bearings on your locomotives, and be sure he gets the right kind, that standard, tried-and-found-true bearing—Hess-Bright.

The Hess-Bright Mfg. Co.
Front St. and Erie Ave. Philadelphia, Pa.

INDUSTRIAL LOCOMOTIVES FOR STANDARD AND NARROW GAUGE

Correct design is as essential to the successful operation of small locomotives as it is to large ones on trunk lines. Even more so, because they must often work at a distance from shops or repair facilities.

They must be as well and as carefully built, must have large boilers that steam freely, with sufficient power to haul the load. They must be ready for service all day and every day.

Our standard light locomotives embody the most modern construction, are built for the hardest service and do the most work for the least cost.

They are built to successfully operate on rough and uneven tracks. Consult us when you want a new locomotive.

"MARCUS" Patent Picking Table Screen

BY combining the functions of the separate picking table and the incline screen in one patented machine, "THE MARCUS," we have put into the hands of Coal Operators another means of better coal preparation—naturally greater profits.

THE MARCUS is a horizontal, vibrating screen that has a greater capacity per foot of screening service than the well known "inclined shaker screen."

THE MARCUS is a picking table on which hand picking is more effective than on the old style apron conveyor. The MARCUS combines therefore in one machine a superior screen and a superior picking table. In each capacity it is the very best device known for the purpose and saves from six to ten feet in height of tipple structure and can be added to an existing tipple without raising dumping point.

THE MARCUS is the expression of triumph in the preparation of coal so far as it can be prepared in the tipple and is going to supersede the shaker screen just as the shaker screen has superseded the bar screen.

Better write for interesting details now.

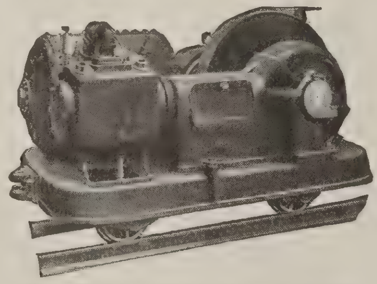
Sullivan Underground Air Compressors

The advantages of small, portable, air power units for use underground appeal to many mine owners, particularly in extended workings and those under development.

A Western Coal Company has recently purchased six of these Sullivan rigs, to operate Sullivan Post Punchers in various parts of a large mine.



Sullivan Portable Electric-Driven Compressor "WK-2"

Sullivan Post Puncher in a steep seam.

Sullivan "WK-2" Compressors

are complete, portable units, independent except for the electric feed wire.

The single stage, center crank compressor is driven by motor, (A. C. or D. C.) through gear and pinion. The cylinder has a hopper jacket for cooling water. The motor is damp proof. Capacity, one or two pick machines or rock drills, a post puncher, or several hammer drills.

Bulletin 58 P C.

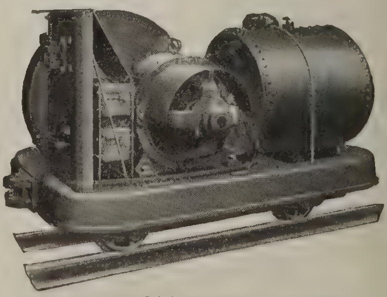
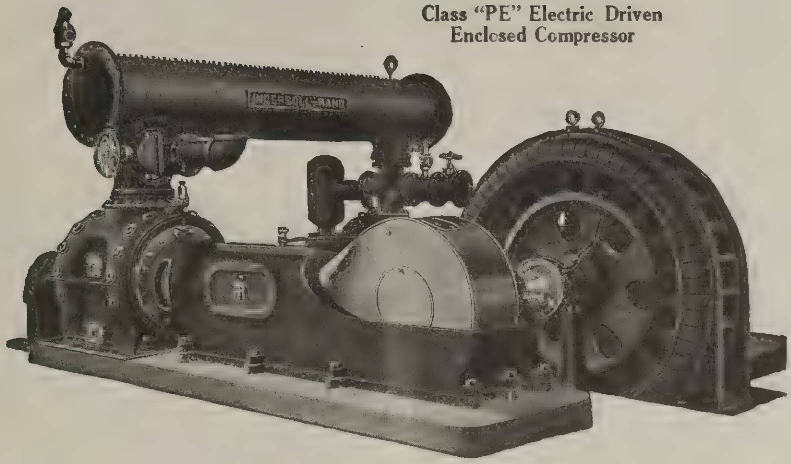
122 So. Michigan Avenue Chicago



Sullivan "WK-2" Compressor, motor side.



Class "PE" Electric Driven Enclosed Compressor

Enclosed Construction in Air Compressors

No one would think of mixing sand or grit with the oil for his compressor. Yet the average air compressor without provision for excluding dirt is subject to just this sort of abuse.

Result—excessive power consumption, excessive friction and wear, leakage, loss of adjustment and sacrifice of efficiency.

Enclosed, dust-proof construction is a standard and distinctive feature of all types of Ingersoll-Rand Compressors.

Moreover, this protection is secured without any sacrifice of the "get-at-able" convenience so essential to successful operation; for the covers are easily removed for inspection and adjustment, without loosening any bolts.

Ingersoll-Rand enclosed construction keeps the dirt out and keeps the oil in. This means not only the most efficient and economical lubrication, but also the utmost cleanliness of machine and surroundings.

An unenclosed air compressor is more than an anomaly, today—it is an extravagance.

Get all good features in one Locomotive

Mine service demands *rolled steel side frames* and *commutating pole ball bearing* motors. The G-E mining locomotive has these features, whose success has been assured, and every other essential requisite necessary to meet mine-haulage conditions.

The rolled steel side frames give great strength. The commutating poles insure perfect commutation and lengthen brush wear.

Ball Bearings Banish Repairs

The ball bearings used for G-E mining locomotive motors prevent armature from touching pole pieces, keep oil out of motor, maintain commutator in alignment, cut down bearing friction and reduce quantity of lubricant required.

Our mining locomotive specialists are ready to give you all desirable features in one G-E mining locomotive.

63,600 Lbs. Up 30 Degrees at 20.45 Miles Per Hour

is made an every-day occurrence at the Woodward Iron Company's property, Woodward, Ala., by this Vulcan Electric Hoist, because it was built after a careful analysis of local conditions, by Vulcan engineers, backed up by an organization with a 65-year experience in the heart of the Pennsylvania mining regions.

Vulcan Electric Hoists

are built with Strength, Simplicity and Perfect Control, for their foundations. Heavy cast frames, herring-bone cut-steel gears in the larger sizes, ample drum strength with big drum diameters and instant operative response, either forward or reverse, make performances like this commonplace. Made to meet any condition, in any capacity or size.

Send for the Electric Hoist Book.

Core Contractors With An Engineering Standing

It isn't the equipment, or the number of men employed, or the way a job is hurried through that creates a standing as Reliable Core Drilling Contractors.

But it is a combination of all these requirements coupled with actual experience and good and reliable notes of each hole drilled that has been our means of establishing a reputation for reliable and satisfactory service.

During our twenty five years' experience as engineers, we have taken cores from every strata of the earth, drilling from the surface, under ground, and under water.

Write for a list of our clients and arrange for an interview.

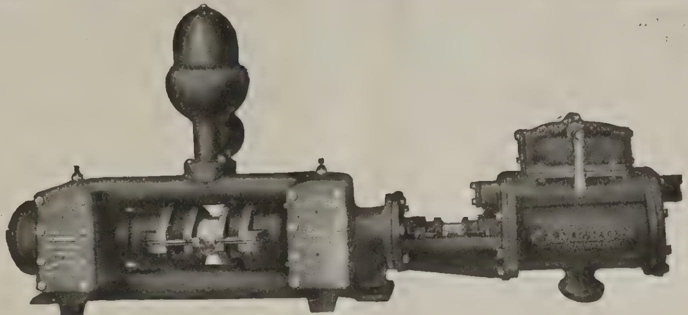
The Slogan of the Cameron—"Character: The Grandest Thing"



This Cameron Pump Built to Withstand Gritty Water

If you have had trouble with pumps that have suffered from the wearing qualities of gritty water, then get satisfaction with this Cameron Outside-Packed Plunger Pump.

It is much more durable than a piston pump.

The water-end has no wearing parts except the packing in the stuffing boxes which can be instantly adjusted from the outside. There are no rods, arms or working parts exposed to rust or damage. The plunger is supported in stuffing boxes, and cannot sag or get out of line at the end of the stroke.

There's a Cameron Pump to overcome every pumping difficulty. Get the right type for your purpose. Write for Bulletin No. 9 showing many types of Cameron Pumps and giving valuable information.

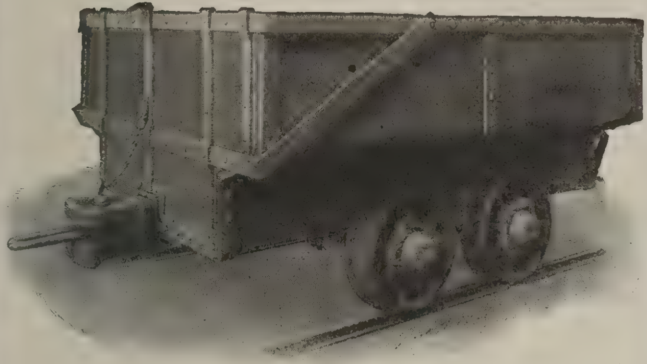
Watt Steel Mine Cars
are High Quality Cars



Some Reason Why Talks
No. 4—Oldest and Largest

There is no advantage in being merely the oldest concern in your line. A mummy is pretty old and you can't say much else in his favor. Neither is there advantage in being the largest. Capital earned in some other line could build a mammoth plant in short order.

But to be both the oldest and the largest indicates success and the possession of experience and manufacturing facilities unrivaled.

Nothing succeeds like success. The product of a successful plant must be a superior one.

Six Selected Books for Readers of Coal Age

Richards—
Compressed Air Practice

By Frank Richards, Managing Editor "Compressed Air Magazine."

330 pages, 6x9, illustrated, $3.00 (12/6) *net, postpaid.*

A new book for the operator of compressed air plants and compressed air machinery.

Mr. Richards has had wide experience. His book is the result of an immense amount of painstaking labor and energy. He presents the material in an original manner and gives many practical suggestions that add materially to the value of the book.

It is a simple, practical statement covering operation and equipment. It is based on a long experience with compressed air problems, and an intimate association with the development of the industry.

Examine it without risk under the Return Privilege Guarantee.

Handbook of Mining Details

By the Editorial Staff of the ENGINEERING and MINING JOURNAL.

372 pages, 6x9, 250 illustrations, $4.00 (17s) *net, postpaid, subject to the Return Privilege Guarantee.*

A handbook with just the right material for the man in the field. It is an encyclopedia. It seems to supply the information that has long been wanted in exactly this form. It covers: I. General Notes. II. Explosives. III. Rock Drills. IV. Shaft Work. V. Driving Adits and Drifts. VI. Stoping. VII. Head Frames, Chutes, Pockets, etc. VIII. Hoisting and Transportation. IX. Skips, Cages, Cars and Buckets. X. Safety Appliances for Hoisting and Tramming. XI. Pumping and Draining. XII. Ventilation and Compressed Air.

Ketchum—
Mine Structures

By MILO S. KETCHUM, C.E., Dean of College of Engineering, University of Colorado.

460 pages, 6x9, 265 illustrations, $4.00 (17s) *net, postpaid.*

Specifications, detailed plans, cost data and practical information of immense value to the superintendent are given.

It has material for engineers responsible for new Head Frames, Coal Tipples, Coal Washers, Breakers, Bins or other mine buildings made of timber, steel, and reinforced concrete. *Examine it under Return Privilege Guarantee.*

Charlton—
American Mine Accounting

By W. H. CHARLTON, Member of Lake Superior Mining Institute.

367 pages, 6x9, $5.00 (21s) *net, postpaid.*

The forms used in existing systems are explained fully and clearly. It shows you exactly how successful companies are today keeping simple, accurate records of costs.

Coal Mining and Coke Making are given a special section based on the methods of the Utah Fuel Company.

The book covers also the accounting methods for Mining Iron Ore; Mining and Milling Native Copper; Mining and Smelting Copper Ore; Mining and Milling Gold Ore. There is also a good chapter on "Recording Engineering and Geological Data."

Form your own opinion of it by an examination under the Return Privilege Guarantee.

White—
Technical Gas and Fuel Analysis

By ALFRED H. WHITE, Professor of Chemical Engineering, University of Michigan.

276 pages, 5½x8, *47 illustrations,* $2.00 (8/4) *net, postpaid.*

A modern book written from direct experience and various authentic sources. It deals with the latest methods and equipment and is full of the practical suggestions that are of value to the commercial analyst.

You don't have to buy it outright to know whether it fits your work—see the Return Privilege Guaratnee.

Somermeier—
Coal Its Composition, Analysis, Utilization and Valuation

By E. E. SOMERMEIER, Professor of Metallurgy, Ohio State University.

175 pages, 6x9, illustrated, $2.00 (8/4) *net, postpaid.*

A working manual for the buyer, tester or analyst.

A concise treatise on coal analysis and valuation, including testing for heating value, composition, etc.

It gives tables showing the properties of all coals mined in the United States.

The Return Privilege Guarantee permits you to examine the book without risk.

THE RETURN PRIVILEGE GUARANTEE

When cash accompanies an order for McGraw-Hill books the purchaser may, within five days of receipt of the books, return any or all of his purchase for any reason whatsoever, and his money will be refunded promptly and without question.

PERFORATED METALS
of every description

Perforated Steel Screen Plates

For Coal and Coke, Crushed Stone, Phosphate Rock, Gravel, Sand, etc.

With perforations round, square or oblong of any size to ten inches in diameter and from No. 10 U.S.S. Gauge to $\frac{1}{2}$ inch thick, according to the size of holes.

The Plates are made flat for shaking screens, rolled to radius for cylindrical, or cut into sectors for conical screens, and made for either lap or butt joints with bolt holes as required.

For Bituminous Coal Screens, Coal and Ore Washing Plants, etc., the variation in diameters of round sizes is about as follows: from 1-16" to $\frac{3}{8}''$ dia. by 32nds; $\frac{3}{8}''$ to $\frac{3}{4}''$ by 16ths; $\frac{3}{4}''$ to $1\frac{1}{2}''$ by $\frac{1}{8}$ths; $1\frac{1}{2}''$ to 4" by $\frac{1}{4}$ths; and 4" to 10" by $\frac{1}{2}$ inches, with many intervening sizes, all standard centers—and the same in a measure with oblongs and squares.

Variations in thickness of metal run from No. 18 U.S.S. Gauge (1-20th in.) to one-half inch, according to size of holes.

Manganese Bronze Screens for Sulphurous Mine Waters.

Please send detail specifications with your order or inquiry.

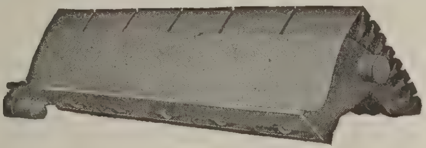
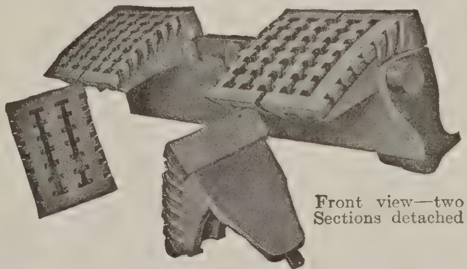
HERE'S A GRATE THAT CAN'T BURN OUT



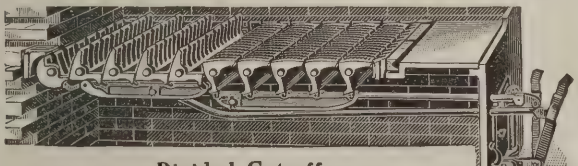
Back view of McClave Removable Sectional - Top Grate Bar No. 2.



Front view—two Sections detached

McClave Grate No 2

The bar of this grate has a detachable top, **cast in sections.** These sections fit down securely by a shank and socket arrangement upon the body part of the bar, but any section can be quickly and easily removed and a new section placed, if burning, warping or breakage occurs. The body part, which is trussed in design, stronger than the usual single piece bar, is absolutely protected from heat-action by these tops. **The bar itself cannot burn out.**
A special advantage is that these new bars can be placed in old style grates, so that as burning or wearing out of the old bars takes place, the whole furnace can be gradually fitted with these better bars.



Divided Cut-off

McCLAVE GRATES AND ARGAND BLOWERS

are especially worth your investigation if you wish to use low grade fuels. By using these grates and these blowers in combination, fuels such as Birdseye, buckwheat slack, rice, etc., can be burned with results closely approximating those with high grade fuels costing twice as much, under less efficient burning conditions. Investigation will pay you.

Ask us for complete information and for Catalog "H."

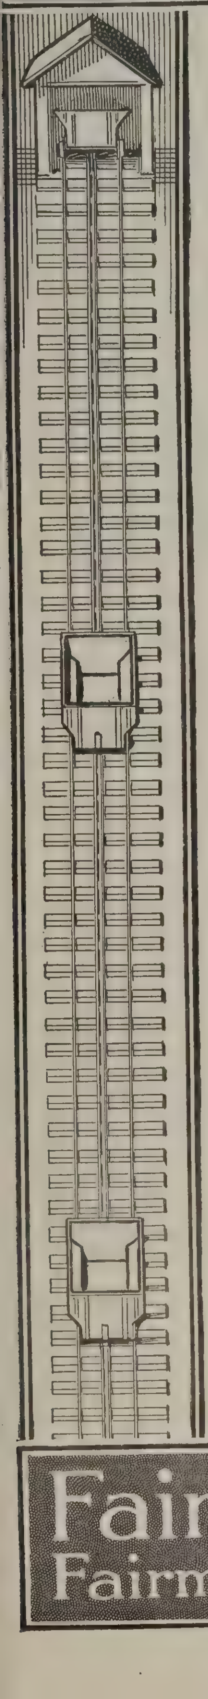
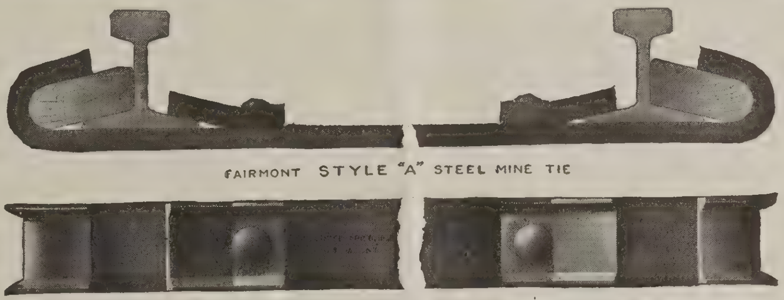
FAIRMONT
COAL MINE EQUIPMENTS





FAIRMONT STYLE "A" STEEL MINE TIE

You don't have to shoot as much rock for height if you use

FAIRMONT STEEL MINE TIES

Because they bring the rails right down to the floor. It's a saving you can't afford to overlook. Our ties do not require any railroad spikes to lay them. No track-men. They save time in laying and in tearing up. Can be used over and over again. A true smooth track is assured. Rolling friction is reduced. They merit your investigation.

Small Mine Pumps You Can Depend On

Pumps that are built to give you service under the most severe conditions. In Fairmont Double Acting Electric Driven Force Pumps all parts are accurately machined and interchangeable. Cylinder valves and seats are cast from acid-resisting bronze. You can put them on a truck and take them anywhere in the mine.

You need our bulletin on all kinds of mining equipment. Write today for your copy.
